BRIEF SUBJECT INDEX

Germany
6369, 7049

Gerontology (see also Geriatrics)
5496, 5789, 5989, 6101, 6102, 6103, 6104,
6105, 6358, 6422

Gestalt Psychology
6507, 7155

Gifted
6976

Gland (see also Epinephrine, Hormone)
5590, 5620, 5622, 5623, 5641, 5777, 5785,
5787, 5813, 5861, 5868, 5902, 6648

Goal (SEE Motivation)

Goodenough Test (SEE Projective Technique)

Government
5204, 6113, 6273, 6514, 6518, 6776, 6918,
7016, 7112

Grades & Grade-Point Average (SEE Achieve-
ment/Academic, Achievement/Academic-
College, Achievement/Academic-Elementary
School)

Grammar
5440, 5504, 5514, 5515, 5518, 5550, 6042,
6832, 7069

Graphology (SEE Writing)

Great Britain
5594, 6052, 6129, 6143, 6334, 6401, 6453,
6501, 6922, 6940, 7025, 7043, 7053, 7128

Group (see also next headings, Community,
Culture, Interpersonal Processes)
6133, 6145, 6154, 6156, 6190, 6193, 6196,
6204, 6206, 6210, 6221, 6429, 6567, 6661,
6670, 7033, 7064

Group Discussion
5200, 6211, 6217, 6438, 6751, 7061

Group Dynamics
6194, 6197, 6205, 6242, 6478, 7142

Group Influence (SEE Social Influence)

Group Structure (SEE Group, Role)

Group Therapy (SEE Psychotherapy/Group)

Group/Ethnic (SEE Ethnology)

Group/Small (see also Interpersonal Pro-
cesses)
6197, 6203, 6210, 6224, 6438, 6491

Guidance (SEE next headings, Counseling)

Guidance/Child (SEE Psychotherapy/Child-
ren, Guidance/Educational)

Guidance/Educational
7018, 7021, 7023, 7025, 7027, 7028, 7029,
7049, 7051, 7084

Guidance/Vocational
6099, 6464, 6779, 6996, 7021, 7024, 7030,
7108, 7113

Guilt (SEE Emotion, Motivation)

Guinea Pig (SEE Animals)

Gustation (SEE Taste)

Habit (SEE Learning, Extinction)

Habituation
5381, 5552, 5628, 5642, 5700, 5716, 5735,
5799, 5995, 5999, 6856

Hallucination
6511, 6687, 6698

Hallucinogen (SEE Drugs, Lysergic Acid
Diethylamide)

Halo Effect (SEE Rating Scale)

Hand (see also Body, Motor Performance)
5304, 5324, 5385, 5403, 5443, 5610, 5856,
5991, 6036, 6060, 6862, 7013, 7099

Handedness (SEE Laterality)

Handicap (SEE Childhood/Handicapped,
Physical Handicap, Blindness, Deafness &
Hearing Disorder)

Handling (see also Experience/Early)

Handwriting (SEE Writing)

Headache (SEE Illness)

Hearing (SEE Audition)

Hearing Loss (SEE Audition, Deafness &
Hearing Disorder)

Hearing/Hard of (SEE Deafness & Hearing
Disorder)

Heart (see also Blood, Blood-Animal, Blood
Pressure, Cardiovascular Processes, Heart
Rate)
5644, 5709, 5825, 5838, 5839, 5840, 5843,

6906

Heart Rate
5293, 5586, 5627, 5633, 5835, 5836, 5837,
5838, 5839, 5841, 5844, 5848, 5862, 5866,
5993, 5999, 6014, 6016, 6023, 6195, 6245,
6267, 6309, 6856, 6895, 7153

Heat (SEE Temperature)

Height (SEE Physique)

Helping Behavior (SEE Interpersonal Pro-
cesses)

Heredity (SEE Genetics)

High School (SEE School, Student/High
School, Adolescence)

Higher Education (SEE College)

Hippocampus
5628, 5629, 5630, 5639, 5648, 5651, 5658,
5663, 5669, 5674, 5686, 5688, 5700, 5758,
5846

History (see also Psychology/History of)

Hoarding (SEE Instinctive Behavior)

Homicide (SEE Crime & Criminals, Suicide)

Homosexuality
6364, 6637, 6638, 6640, 6778

Honesty (SEE Deception)

Hormone (see also Epinephrine)
5590, 5619, 5620, 5621, 5622, 5623, 5635,
5650, 5655, 5657, 5779, 5783, 5784, 5785,
5786, 5787, 5825, 5853, 5864, 5968, 6523,
6530, 6548, 6641, 6648, 6679

Hospital & Hospitalization (see also Clinic,
Institution & Institutionalization, Mental
Hospital & Hospitalization)
6468, 6560, 6566, 6854, 6855

Hostility (see also Aggression)
6121, 6128, 6192, 6316, 6478, 6623

Hue (SEE Color)

Human Engineering (SEE Engineering Psy-
chology)

Humor (see also Literature, Language, Emo-
tion)
5418, 6081, 6316

Hunger (SEE Food Deprivation, Motivation)

Husband (SEE Marriage)

Hypnosis
5321, 5412, 5413, 5414, 5415, 5416, 5736,
6384, 6458

Hypnotherapy (SEE Hypnosis, Psychothera-
py/Methods in)

Hypothalamus
5647, 5649, 5650, 5652, 5657, 5658, 5671,
5676, 5677, 5681, 5686, 5687, 5691, 5700,
5730, 5768, 5785, 5805, 5811, 5846, 5853

Hysteria & Hysterics (see also Mental Dis-
order, Neurosis, Psychosis)
6289

Id (SEE Psychoanalytic Theory)

Identification
5556, 6409, 6469, 6561

Identity
6632

Illegitimate Pregnancy (SEE Pregnancy, Moth-
er)

Illness (see also Disease)
6461, 6642, 6664, 6756, 6758, 6759, 6907,
6908, 6910, 6912

Illumination (SEE Brightness, Environment)

Illusion
5312, 5313, 5314, 5315, 5316, 5317, 5318,
5319, 5347, 5362, 5979, 6814

Image (see also Self-Perception, Social Per-
ception, Body)
5268, 5345

Imagery
5299, 5351, 5469, 5471, 5494, 5510, 6683

Imagination (SEE Fantasy, Cognition, Think-
ing)

Imitation (see also Instinctive Behavior, In-
terpersonal Processes, Model)
5970, 6060, 6085, 6087, 6223, 6723

Impression Formation (SEE Social Perception)

Imprinting (SEE Instinctive Behavior, Ex-
perience/Early)

Incentive (see also Motivation, Reward, Re-
inforcement)

5479, 5892, 6200

Incest (SEE Sexual Deviation)

Incidental Learning (SEE Learning)

Income (SEE Money, Socioeconomic Status)

Independence (SEE Dependency)

India
5186, 5856, 6133, 6136, 6141, 6225, 6262

Indian/American (SEE Ethnology)

Individual Differences

6113, 7107, 7111, 7115, 7123, 7125, 7126, 7129, 7130, 7132, 7135, 7136, 7137, 7138, 7139, 7144, 7146, 7148
- Job Satisfaction**
6438, 6505, 7124, 7125, 7127, 7128, 7129, 7131, 7133, 7134, 7138, 7140, 7141, 7146, 7152
- Judgment**
5229, 5234, 5293, 5488, 5553, 6054, 6080, 6168, 6216, 6222, 6224, 6228, 6229, 6231, 6236, 6303, 6327, 6331, 6412
- Judgment/Perceptual** (see also Perception, the various senses)
5219, 5300, 5309, 5310, 5320, 5333, 5359, 5366, 5392, 6074, 6235
- Junior College** (SEE College)
- Junior High School** (SEE School, Student/Junior High School)
- Juvenile Delinquency** (SEE Delinquency/Juvenile)
- Kibbutz/Israel** (SEE Israel)
- Kindergarten** (SEE Childhood/Preschool)
- Kinesthesia** (see also Movement)
5433, 5541, 6825, 6869, 6900, 7012, 7024
- Kinship** (SEE Family, Culture)
- Knowledge of Results** (SEE Feedback, Reinforcement, Information)
- Korsakov's Psychosis** (SEE Alcoholism, Brain Disorder)
- Labor Relations** (SEE Personnel/Industrial, Management)
- Language** (see also next headings, Communication, Information, Speech, Psycholinguistics, Verbal Behavior)
5193, 5256, 5257, 5433, 5462, 5467, 5518, 5525, 5977, 6021, 6031, 6050, 6118, 6142, 6207, 6244, 6257, 6258, 6259, 6260, 6261, 6449, 6831, 6898, 6978, 6981, 6989, 7011
- Language Development**
5977, 5990, 6008, 6049, 6059, 6723, 6988
- Language/Foreign**
5431, 6132, 6142, 6255, 7093, 7101
- Latent Learning** (SEE Learning)
- Laterality**
5241, 5304, 5323, 5376, 5403, 5443, 5604, 5610, 5856, 5976, 6002, 6004, 6036, 6048, 6075, 6772, 6863, 6878, 6889, 7013, 7015, 7094, 7099
- Latin America**
5202, 5208, 6022, 6063, 6123, 6140, 6367, 6369, 6372, 6383, 6587, 6604, 6884, 6885, 6888, 7076, 7108, 7113
- Law** (see also Government, Political Behavior)
5203, 5207, 6136, 6160, 6161, 6162, 6268, 6271, 6273, 6416, 6560, 6589, 6660, 6796, 6913, 7016
- Leadership** (see also Management)
6126, 6201, 6221, 6224, 6472, 6491, 6661, 6941, 6944, 6963, 7019, 7131, 7144
- Learning** (see also next headings, Association, Conditioning, School Learning, Rat/Learning in, Monkey/Learning in, Cat/Learning in, Childhood/Learning in)
5299, 5378, 5395, 5404, 5431, 5437, 5447, 5448, 5478, 5495, 5617, 5662, 5789, 5872, 5875, 5902, 5913, 5983, 6255, 6630, 6692, 6809
- Learning Disorders**
5980, 6025, 6394, 6406, 6408, 6414, 6763, 6825, 6840, 6854, 6855, 6939, 6976, 6978, 6980, 6983, 6984, 6989, 6992, 6997, 6999, 7000, 7001, 7003, 7004, 7005, 7007, 7008, 7009, 7010, 7011, 7012, 7016, 7031, 7045, 7080
- Learning Model** (SEE Model)
- Learning Set** (SEE Set, Expectation)
- Learning Theory**
5193, 5450, 5451, 5468, 5509, 6492, 6500
- Learning Transfer**
5451, 5466, 5474, 5475, 5476, 5780, 5823, 5904, 5932, 5941, 6029, 7050
- Learning/Avoidance** (see also Rat/Avoidance & Avoidance Learning in)
5292, 5407, 5453, 5643, 5651, 5775, 5877, 5881, 5908, 5912, 5941, 5946
- Learning/Discrimination** (see also Discrimination Reversal, Rat/Discrimination in)
5459, 5463, 5468, 5904, 5925, 5926, 5927, 5931, 5955, 6027, 6029, 6039, 6233, 6329, 6896, 6901
- Learning/Escape** (SEE Escape)
- Learning/Incidental** (SEE Learning)
- Learning/Instrumental** (SEE Conditioning/Operant Rat/Conditioning in)
- Learning/Maze** (see also Rat/Maze Learning in)
5288, 5892
- Learning/Motor**
5434, 5438, 5448, 7092, 7094, 7097
- Learning/Over** (SEE Learning)
- Learning/Pairing** (SEE Association)
5424, 5469, 5470, 5471, 5472, 5474, 5475, 5476, 5477, 5482, 5493, 5525, 5527, 5534, 6028, 6038, 6897, 6899
- Learning/Probability**
5445, 5446, 5645
- Learning/Reversal** (see also Discrimination Reversal)
5592, 5645, 5904, 5934
- Learning/Spatial**
5461, 5464, 5504, 5519
- Learning/Verbal** (see also Learning/Pairing Associate)
5447, 5456, 5458, 5459, 5460, 5462, 5463, 5465, 5466, 5467, 5468, 5469, 5476, 5503, 5509, 5511, 5528, 6026, 6317, 6636, 6878
- Legibility** (SEE Display, Writing)
- Leisure** (SEE Recreation)
- Lesion** (see also Brain Lesion, Brain Lesion-Animal, Rat/Lesions in, Cat/Lesions in)
5590, 5620, 5624, 5696, 5769, 6773, 6836
- Liberalism** (SEE Political Behavior, Personality Trait)
- Licensing** (SEE Law)
- Light** (see also Brightness, Color)
5575, 5641, 5710, 5727, 5746, 5874, 5937, 5973, 6001, 6815, 6862
- Light Adaptation** (SEE Adaptation/Sensory)
- Lighting** (SEE Brightness, Environment)
- Liking** (SEE Interpersonal Attraction)
- Linguistics** (SEE Language, Psycholinguistics)
- Listening** (SEE Attention, Audition, Speech Perception)
- Literature**
5195, 6263, 6338, 6451, 6570, 6574, 6575, 6668, 7104
- Lobotomy** (SEE Brain Lesion, Brain Lesion-Animal)
- Localization**
5403, 5405, 5909, 6849
- Logic** (see also Thinking)
5282, 5553, 5562, 6954, 6970
- Loneliness** (SEE Isolation, Alienation)
- Longitudinal Study** (SEE Experimental Design)
- Loudness** (SEE Audition, Noise, Sound)
- Love** (SEE Emotion)
- Lower Class** (SEE Socioeconomic Status)
- LSD** (SEE Lysergic Acid Diethylamide)
- Luminance** (SEE Brightness, Environment)
- Lying** (SEE Deception)
- Lysergic Acid Diethylamide**
5654, 5815, 5831, 6268, 6271
- MA Scale** (SEE Anxiety)
- Machine** (SEE Apparatus)
- Man-Machine Systems** (SEE Engineering Psychology)
- Management** (see also Business, Leadership)
6143, 7107, 7117, 7131, 7134, 7142, 7143, 7144, 7145, 7146, 7147, 7148, 7149
- Mania** (SEE Mental Disorder, Emotional Disturbance)
- Manic-Depressive Psychosis** (SEE Depression, Psychosis)
- Manifest Anxiety** (SEE Anxiety)
- Marihuana**
5790, 5798, 6266, 6268, 6271
- Marital Problems** (see also Family Therapy)
6453, 6624
- Marketing & Marketing Research** (SEE Consumer Behavior)
- Marriage** (see also Family, Sexual Behavior)
5197, 6022, 6146, 6147, 6148, 6154, 6155, 6157, 6478, 6610, 6663, 6667, 6800
- Masculinity** (SEE Sex Role)
- Masking** (see also Interference)
5339, 5419, 6824, 6827
- Masochism** (SEE Sexual Deviation)
- Mass Behavior** (SEE Group, Social Behavior-Human)
- Mass Media** (SEE Communication/Mass)
- Maternal Behavior** (see also Mother, Parent-Child Relations, Child Rearing)
5614, 5881, 5966
- Mathematics** (see also Number)
5189, 5196, 5214, 5217, 5219, 5220, 5222, 5224, 5225, 5226, 5230, 5234, 5237, 5238, 5241, 5257, 5335, 5348, 5360, 5562, 5570, 5767, 6944, 6967, 7005, 7053, 7057, 7066,

BRIEF SUBJECT INDEX

7116
Mating Behavior (SEE Sexual Behavior—Animal)
Maturation (see also Development)
 6043, 7010
Maudsley Personality Inventory (SEE Test/Personality)
Maze (SEE Learning/Maze, Rat/Maze Learning in, Apparatus—Animal)
Meaning (see also Semantics)
 5191, 5299, 5338, 5351, 5480, 5488, 5513, 5985, 6020, 6063, 6086, 6244, 6254, 6281, 6297, 6339, 6380, 6717, 7155
Meaningfulness
 5351, 5440, 5460, 5464, 5476, 5491, 6260, 6317, 6826, 6863, 6899
Measurement (see also Educational Measurement, Scaling, Statistics)
 5213, 5219, 5220, 5224, 5230, 5275, 5281, 5326, 5363, 5569, 5706, 6009, 6010, 6090, 6361, 6816, 7135
Mediating Response (SEE Mediation)
Mediation
 5299, 5456, 5458, 5525, 5553, 6028, 6038, 6172, 6826
Medicine (see also Nursing, Physician, Surgery)
 6402, 6404, 6410, 6527, 6532, 6536, 6540, 6592, 6615, 6757
Memory (see also Recall, Recognition, Retention)
 5175, 5298, 5350, 5372, 5485, 5487, 5488, 5490, 5491, 5492, 5493, 5495, 5497, 5498, 5499, 5500, 5503, 5505, 5506, 5507, 5508, 5512, 5513, 5517, 5518, 5519, 5520, 5522, 5523, 5525, 5526, 5527, 5529, 5530, 5531, 5562, 5597, 5661, 5666, 5850, 5901, 5987, 6004, 6054, 6290, 6331, 6577, 6870, 6878, 6898, 6984
Memory/Short Term
 5340, 5498, 5501, 5503, 5511, 5512, 5520, 5533, 5534, 5535, 5536, 5538, 5539, 5540, 5541, 5543, 5545, 5546, 5547, 5548, 5549, 5903, 5987, 6032, 6033, 6049, 6764, 6826, 6932
Meningitis (SEE Nervous System/Disorder of)
Menstruation (SEE Biological Rhythms)
Mental Deficiency (SEE Mental Retardation)
Mental Development (SEE Development)
Mental Disorder (see also Neurosis, Psychosis, specific disorders)
 5980, 6276, 6406, 6434, 6454, 6511, 6535, 6539, 6551, 6581, 6595, 6627, 6642, 6646, 6651, 6653, 6654, 6656, 6660, 6662, 6664, 6665, 6666, 6668, 6673, 6694, 6759, 6769, 6781, 6784, 6801
Mental Health (see also Adjustment/Personal & Social, Community Services)
 5980, 6296, 6386, 6396, 6397, 6424, 6432, 6449, 6776, 6780, 6781, 6782, 6783, 6795, 6796, 6831, 6914, 6916, 6917, 6918, 6919, 6920, 6924, 6925, 6927, 6929
Mental Hospital & Hospitalization (see also Hospital & Hospitalization, Institution & Institutionalization)
 6395, 6401, 6438, 6460, 6471, 6508, 6558, 6559, 6562, 6563, 6564, 6589, 6597, 6656, 6658, 6661, 6670, 6750, 6753, 6926
Mental Hospital/Programs in
 6429, 6454, 6508, 6561, 6563, 6931
Mental Hygiene (SEE Mental Health)
Mental Patient (SEE Psychiatric Patient)
Mental Processes
 5180, 5194, 5212, 5311, 5321, 5555, 5593, 6101, 6819, 6870
Mental Retardation (see also next headings, Learning, Learning Disorders)
 5855, 5980, 6392, 6400, 6880, 6881, 6883, 6884, 6885, 6887, 6888, 6889, 6890, 6891, 6893, 6894, 6895, 7002
Mental Retardation/Diagnosis of
 6886, 6902
Mental Retardation/Education in (SEE Education/Special—Mental Retardation)
Mental Retardation/Learning in
 6882, 6892, 6896, 6897, 6898, 6899, 6900, 6901, 6903, 6904

Mental Retardation/Treatment of
 6495, 6886, 6891, 6892
Mental Retardation/Vocational Rehabilitation & Training in
 6902, 6903, 6904
Meprobamate (SEE Tranquilizer)
Metabolism
 5657, 5772, 5773, 5774, 5776, 5802, 5815, 5831, 6509, 6531, 6555, 6644, 6645, 6648, 6652, 6679, 6694
Method & Methodology (see also Research Methods, Teaching Methods, Experimentation, Measurement, Survey, Experimental Design)
 5176, 5223, 5230, 5565, 5693, 5718, 5740, 5882, 6010, 6114, 6181, 6182, 6184, 6185, 6186, 6188, 6194, 6256, 6288, 6881, 6932, 6966, 7096
Metropolitan Area (SEE Urban & Suburban Environment)
Middle Age (SEE Adulthood)
Migration (SEE Social Processes)
Milieu Therapy (SEE Mental Hospital/Programs in, Psychotherapy/Methods in)
Military (see also Personnel/Military)
 6106
Mind (SEE Cognition, Thinking)
Minnesota Multiphasic Personality Inventory (MMPI)
 5862, 6356, 6364, 6367, 6583, 6589, 6618, 6627, 6631, 6640, 6842
Minority Group (SEE Ethnology)
MMPI (SEE Minnesota Multiphasic Personality Inventory)
Mobility (SEE Movement, Social Mobility, Socioeconomic Status)
Model (see also Limitation)
 5193, 5212, 5213, 5214, 5215, 5216, 5217, 5218, 5219, 5223, 5234, 5236, 5241, 5245, 5250, 5253, 5278, 5303, 5320, 5328, 5329, 5330, 5354, 5369, 5387, 5442, 5492, 5500, 5501, 5505, 5506, 5507, 5520, 5559, 5563, 5570, 5585, 5606, 5608, 5609, 5612, 5613, 5694, 5767, 5876, 6085, 6166, 6231, 6276, 6403, 6424, 6493, 6986, 7011, 7078, 7121, 7122
Money
 5478, 6076, 6664, 6693, 6705, 6973, 7087, 7109
Mongolism (SEE Mental Retardation)
Monitoring (SEE Detection, Attention)
Monkey
 5578, 5637, 5668, 5680, 5701, 5711, 5728, 5751, 5765, 5804, 5837, 5855, 5877, 5887, 5903, 5970, 5971, 5976
Monkey/Learning in
 5578, 5618, 5904, 5925, 5927
Mood (SEE Emotion)
Morale (SEE Job Satisfaction, Attitude, Emotion)
Morality (SEE Value & Values, Religion, Ethics)
Mother (see also Maternal Behavior, Mother-Child Relations, Parent)
 5860, 5982, 5998, 6002, 6022, 6070, 6092, 6149, 6166, 6715
Mother-Child Relations (SEE Parent-Child Relations, Child Rearing)
Motion (SEE Movement)
Motion Pictures (SEE Film)
Motivation (see also next headings, Achievement Motivation, Incentive, Reinforcement)
 5419, 5420, 5485, 5566, 6015, 6122, 6311, 6315, 6616, 6791, 6931, 7019, 7050, 7079, 7138, 7142, 7145
Motivation—Animal (see also Rat/Motivation in)
 5893, 5918
Motivation/Learning (SEE Learning, Motivation)
Motivation Theory
Motor Disorder
 6839, 6843, 6844, 6853, 6857, 6858, 6859, 6861, 6869
Motor Learning (SEE Learning/Motor)
Motor Performance

5324, 5408, 5433, 5436, 5437, 5438, 5440, 5441, 5540, 5542, 5604, 5701, 5742, 5981, 5991, 6004, 6007, 6064, 6077, 6405, 6841, 6846, 6991, 6999, 7008, 7013, 7015, 7077, 7107
Motor Processes (see also Learning/Motor, Muscle)
 5562, 5579, 5591, 5595, 5607, 5611, 5687, 5689, 5704, 5743, 5799, 5903, 5914, 5919, 5970, 6005, 6015, 6040, 6083, 6549, 6611, 6704, 6862, 6870, 6907, 6978, 6980, 7080, 7085, 7090
Motor Skill (SEE Motor Performance)
Mouse
 5616, 5643, 5662, 5713, 5775, 5794, 5802, 5814, 5823, 5833, 5835, 5850, 5881, 5886, 5890, 5892, 5922, 5941
Mouth (SEE Body)
Movement (see also Social Movements)
 5285, 5313, 5314, 5316, 5317, 5337, 5341, 5345, 5347, 5360, 5371, 5377, 5379, 5381, 5435, 5439, 5580, 5765, 5973, 5974, 6010, 6048, 6060, 6810, 6862, 6895
Movement/Apparent (SEE Gestalt Psychology, Visual Perception)
Müller-Lyer Illusion (SEE Illusion)
Multiple Sclerosis (SEE Disease, Nervous System/Disorder of)
Murder (SEE Crime & Criminals)
Muscle (see also Electromyography)
 5424, 5435, 5439, 5583, 5586, 5591, 5607, 5704, 5709, 5863, 6267, 6278, 6839, 6843, 6857
Muscle Sense (SEE Kinesthesia, Somesthesia)
Muscle
 5308, 5388, 5392, 5723, 5888, 6016, 6285, 6503
Mutism (SEE Speech/Defective)
Myth & Mythology (SEE Culture)

Narcissism (SEE Psychoanalytic Theory, Neurosis, Personality Trait)
Narcosis (SEE Sleep, Drug Therapy)
Narcotics (SEE Drugs, Drug Addiction)
Natural Observation (SEE Observation)
Navy (SEE Military, Personnel/Military)
Need (see also Motivation)

BRIEF SUBJECT INDEX

- Rapid Eye Movement** (see also *Dream & Dreaming, Sleep*)
5409, 5711, 5713, 5792, 6102, 6697, 6907
- Rat** (see also next headings)
5600, 5603, 5614, 5709, 5759, 5772, 5778, 5825, 5871, 5968, 5969
- Rat/Activity in**
5623, 5629, 5634, 5638, 5641, 5796, 5802, 5885, 5898, 5923
- Rat/Avoidance & Avoidance Learning in**
5619, 5631, 5638, 5647, 5677, 5678, 5685, 5775, 5784, 5787, 5794, 5816, 5820, 5830, 5836, 5849, 5877, 5885, 5935, 5936, 5937, 5938, 5939, 5940, 5942, 5943, 5944, 5945
- Rat/Brain Stimulation in**
5661, 5663, 5664, 5666, 5671, 5672, 5673, 5675, 5676, 5677, 5678, 5681, 5683, 5684, 5685, 5686, 5832
- Rat/Conditioning in**
5621, 5633, 5634, 5636, 5661, 5663, 5672, 5673, 5683, 5756, 5796, 5797, 5885, 5900, 5910, 5915, 5916, 5917, 5923, 5924, 5935, 5936, 5937, 5947, 5948, 5949, 5950, 5952, 5954, 5957, 5958, 5959
- Rat/Deprivation in**
5675, 5772, 5779, 5782, 5798, 5894, 5897, 5910, 5923
- Rat/Discrimination in**
5639, 5661, 5700, 5832, 5928, 5932, 5933, 5934, 5960
- Rat/Drug Effects in**
5619, 5623, 5629, 5775, 5776, 5778, 5781, 5785, 5794, 5795, 5796, 5797, 5798, 5799, 5800, 5801, 5802, 5806, 5810, 5815, 5816, 5817, 5818, 5820, 5825, 5826, 5828, 5830, 5831, 5833, 5853
- Rat/Extinction in**
5700, 5794, 5797, 5906, 5938, 5943, 5951, 5957, 5960, 5963, 5964
- Rat/Learning in**
5286, 5642, 5645, 5666, 5780, 5900, 5907, 5916, 5924, 5932, 5933, 5948, 5964
- Rat/Lesions in**
5619, 5621, 5622, 5623, 5628, 5629, 5630, 5631, 5634, 5635, 5636, 5638, 5639, 5641, 5642, 5645, 5646, 5647, 5648, 5787, 5869
- Rat/Maze Learning in**
5648, 5806, 5898, 5905, 5907, 5938, 5939
- Rat/Motivation in**
5646, 5787, 5894, 5896, 5899, 5917, 5918, 5923
- Rat/Reinforcement & Reinforcement Schedule in**
5636, 5648, 5663, 5672, 5677, 5683, 5768, 5797, 5847, 5879, 5906, 5915, 5924, 5947, 5948, 5949, 5950, 5951, 5952, 5954, 5957, 5958, 5959, 5960, 5963, 5964
- Rat/Shock & Shock Effects in**
5619, 5638, 5685, 5756, 5773, 5784, 5798, 5800, 5828, 5836, 5852, 5869, 5898, 5899, 5910, 5923, 5924, 5936, 5939, 5940, 5943, 5944, 5945, 5950, 5954
- Rat/Stress Effects in**
5779, 5852
- Rating** (see also *Rating Scale*)
5425, 6227, 6358, 6363, 6476, 7036, 7130, 7144
- Rating Scale**
6142, 6173, 6358, 6556, 6600, 6634, 6712
- Reaction Time**
5320, 5386, 5418, 5425, 5442, 5443, 5444, 5485, 5517, 5751, 5841, 5844, 6322, 6709, 6721, 6815, 6862, 6895, 6900, 7139
- Readability** (SEE *Display, Writing*)
- Reading**
5338, 5470, 5550, 6039, 6050, 6066, 6245, 6984, 7025, 7054, 7058, 7066, 7067, 7069, 7072, 7075, 7077, 7085, 7090, 7098, 7102
- Reading Deficiency** (see also *Education/Special-Remedial*)
6066, 6072, 6763, 6768, 6864, 6984, 6986, 6987, 6989, 6990, 6991, 6993, 7008, 7013, 7015, 7079
- Reasoning** (SEE *Logic, Thinking, Cognition, Categorical Behavior*)
- Recall** (see also *Memory, Recognition, Retention*)

- Schizophrenia/Chronic**
6454, 6703, 6721, 6722, 6729, 6730, 6734, 6735, 6737, 6741, 6742, 6743, 6744, 6746, 6747, 6748, 6749
- Schizophrenia/Diagnosis of**
6706, 6716, 6726, 6729
- Schizophrenia/Family Role in**
6716
- Schizophrenia/Learning & Cognition in**
6400, 6409, 6705, 6714, 6721, 6723, 6724, 6730, 6731
- Schizophrenia/Physiology of**
6642, 6652, 6659, 6699, 6703, 6707, 6710, 6716, 6720, 6726, 6738

BRIEF SUBJECT INDEX

Schizophrenia/Symptomatology of
6409, 6594, 6667, 6706, 6708, 6713, 6715,
6716, 6723, 6725, 6727

Schizophrenia/Treatment of (see also Drug
Therapy—Schizophrenia)
6500, 6716, 6734, 6735, 6738, 6739, 6743,
6745, 6750, 6751, 6752, 6753

Scholastic Achievement (SEE Achievement/
Academic)

School (see also next headings, Achievement,
Classroom, College, Education)
6390, 6882, 6905, 6947, 6970, 7091

School Achievement (SEE Achievement/Ac-
ademic)

School Adjustment
6097, 6945, 6949, 6950, 6952, 6953, 6957,
6959, 6962, 7023, 7073, 7091

School Administration
6269, 6948, 6956, 6963, 7032

School Anxiety (SEE Anxiety, Test Anxiety)

School Dropout
6950, 7051

School Learning (see also Achievement/Ac-
ademic)
5447, 6414, 7050, 7052, 7057, 7058, 7060,
7061, 7065, 7070, 7078, 7080, 7082, 7083,
7100, 7101, 7102

School Psychology (SEE Educational Psy-
chology, Guidance/Educational)

School Subjects (SEE Curriculum, Mathemat-
ics, Reading)

Science & Scientists
5194, 5554, 6043

Scientific Method (SEE Method & Method-
ology)

Score & Scoring
5223, 5235, 5272, 5275, 6282, 6346, 6367,
6371, 6372, 6380

Seasonal Changes (SEE Time, Temperature,
Environment)

Security (SEE Dependency)

Sedative (SEE Drugs)

Segregation (SEE Integration)

Seizure (SEE Electroconvulsive Shock, Nerv-
ous System/Disorder of, Epilepsy)

Selection
5432, 5560, 5561, 6427, 7029, 7034, 7076,
7108, 7114, 7115, 7117

Self (see also next headings)
5480, 6197, 6278, 6305, 6310, 6428, 6451,
6486, 6507, 6632, 6683

Self-Actualization (SEE Self)

Self Concept
5210, 6122, 6125, 6141, 6181, 6182, 6184,
6185, 6186, 6188, 6238, 6240, 6283, 6297,
6307, 6315, 6331, 6419, 6612, 6668, 6675,
6700, 6904, 6949, 7017, 7041, 7042, 7084

Self-Disclosure (SEE Interpersonal Processes)

Self-Esteem (SEE Self-Concept)

Self-Evaluation
5554, 5848, 6197, 6224, 6241, 6307, 6476,
6522, 6582, 6685

Self-Perception
5857, 5981, 6238, 6283, 6295, 6297, 6708,
6775, 6790, 6798, 6876, 7047, 7145, 7152

Self/Ideal (SEE Self Concept)

Self-Stimulation (SEE Motivation, Stimula-
tion, Brain Stimulation, Rat/Brain Stimu-
lation in)

Selling (SEE Advertising, Business, Consumer
Behavior)

Semantic Differential
6142, 6254, 6327, 6412, 6952

Semantics (see also Meaning, Meaningfulness)
5458, 5467, 5480, 5488, 5500, 5513, 5516,
5546, 5547, 5550, 5987, 6012, 6243

Senility (SEE Geriatrics)

Sensitivity
5307, 5402, 5405, 5501, 5638, 5759, 6190,
6194, 6203, 6290, 6422, 6489, 6603, 6828,
6880, 7024, 7029, 7142

Sensory Adaptation (SEE Adaptation/Senso-
ry)

Sensory Deprivation (SEE Deprivation/Sen-
sory)

Sensory Physiology (SEE Physiology/Sensory)

Sensory Processes (see also Intersensory Proc-
esses, Physiology/Sensory)
5301, 5311, 5325, 5346, 5753, 5769, 6040,
6111, 6814, 6841, 6978

Sentence
5488, 5490, 5516, 5977, 6032, 6038, 6042,
6261, 6764

Sentence Completion Test (SEE Projective
Technique)

Serial Learning (SEE Learning/Serial)

Set (see also Expectation)
5234, 5366, 5428, 5431, 5475, 5517, 5562,
5927, 6135, 6237, 6630, 6721

Sex
5380, 5583, 6216, 6362, 6374, 6379, 6392

Sex Differences
5417, 5438, 5854, 5983, 5997, 5998, 6007,
6035, 6037, 6045, 6055, 6061, 6062, 6067,
6069, 6085, 6086, 6096, 6102, 6118, 6133,
6137, 6139, 6140, 6141, 6145, 6148, 6171,
6176, 6198, 6207, 6215, 6225, 6226, 6270,
6281, 6303, 6304, 6322, 6338, 6361, 6401,
6545, 6619, 6638, 6663, 6664, 6669, 6676,
6693, 6715, 6727, 6906, 6929, 6941, 6948,
6959, 6960, 7037, 7039, 7071, 7077, 7084

Sex Differences—Animal
5619, 5784, 5798, 5887, 5890, 5970

Sex Differences/Academic Achievement
5197

Sex Role
6148, 6318, 6354, 6364, 6947, 7124

Sexual Behavior
6097, 6154, 6155, 6156, 6157, 6159, 6640,
6800

Sexual Behavior—Animal
5635, 5650, 5758, 5801, 5834, 5880, 5965,
5967, 5968, 5969

Sexual Deviation (see also Homosexuality)
6490, 6637, 6639, 6641, 6873

Sexual Disorder
6387

Shape Perception (SEE Perception/Form &
Shape)

Shaping (SEE Conditioning)

Sheltered Employment (SEE Rehabilitation/
Vocational)

Shock & Shock Intensity (see also Electro-
convulsive Shock, Brain Stimulation, Rat/
Brain Stimulation in, Rat/Shock & Shock
Effects in)
5419, 5421, 5422, 5437, 5444, 5453, 5610,
5615, 5662, 5752, 5770, 5850, 5893, 5899,
5901, 5908, 5911, 5912, 5920, 5921, 5944,
6192

Shock Therapy (SEE Electroconvulsive Shock
Therapy)

Shock/Electroconvulsive (SEE Electroconvulsive
Shock)

Sibling (SEE Family Relations)

Signal
5391, 5393, 5394, 5404, 5422, 5426, 5430,
5491, 5522, 5545, 5611, 5762, 5945, 5949,
6654, 6866

Similarity
5219, 5234, 5295, 5359, 5379, 5393, 5464,
5476, 5477, 5547, 6071, 6074, 6095, 6238,
6240, 6473

Simulation (see also Model)
5211, 5349, 5501, 5563, 6006, 6477, 7153

Size Constancy (SEE Gestalt Psychology,
Visual Perception, Perception)

Size Perception (SEE Perception/Size)

Skin (see also Cutaneous Sense)
5405, 5586, 5723, 5771, 5862, 5865, 5866,
5992, 6006, 6014, 6267, 6309, 6714, 6895,
6908

Skin Resistance (SEE Skin, Galvanic Skin
Response)

Sleep (see also Dream & Dreaming, Rapid
Eye Movement)
5391, 5407, 5408, 5409, 5410, 5495, 5605,
5691, 5711, 5713, 5715, 5728, 5737, 5741,
5745, 5779, 5782, 5786, 5792, 5808, 5865,
5876, 5992, 5993, 6001, 6102, 6528, 6697,
6850, 6861, 6907

Slow Learners (SEE Learning Disorders,
Mental Retardation)

Smell
5401, 5402, 5614, 5620, 5697, 5906, 5939,
5975

Smoking
6267

Social Processes (see also next headings,
Interpersonal Processes)
6108, 6114, 6115, 6119, 6150, 6154, 6174,
6175, 6283, 6330, 6398, 6563, 6568, 6651,
6757, 6795, 6930, 7073, 7078

Social Acceptance (SEE Acceptance, Social
Approval)

Social Adjustment (SEE Adjustment/Personal
& Social)

Social Approval (see also Acceptance)
6088, 6107, 6125, 6130, 6199, 6206, 6211,
6282, 6286, 6310, 6329, 6350, 6351, 6352,
6445, 6588, 6670, 7023, 7077

Social Attraction (SEE Interpersonal Attrac-
tion)

Social Behavior/Animal
5626, 5637, 5814, 5872, 5878, 5881, 5883,
5886, 5887, 5966, 5967, 5970, 5975

Social Behavior/Human (see also Childhood/
Social Behavior in)
5878, 6141, 6189, 6190, 6195, 6196, 6198,
6208, 6209, 6622, 6626, 6711, 6893, 6931,
6933, 6958

Social Casework
6174, 6401, 6430, 6432, 6804, 6805, 6806,
6913

Social Change
6112, 6116, 6117, 6119, 6123, 6151, 6153,
6330, 6398, 6441, 6568, 6571, 6757, 6780,
6946, 7109, 7149, 5856

Social Class (SEE Social Structure, Socio-
economic Status)

Social Deprivation (SEE Childhood/Disad-
vantaged, Socioeconomic Status)

Social Desirability (SEE Acceptance, Social
Approval)

Social Distance (SEE Isolation, Social Ap-
proval)

Social Influence (see also Interpersonal Influ-
ence)
5279, 5283, 6117, 6122, 6140, 6262, 6438

Social Interaction
6211, 6445, 6643, 6722, 6728, 6773

Social Isolation (SEE Alienation, Isolation)

Social Mobility (see also Social Structure)

Social Model (SEE Social Processes, Social
Structure)

Social Movements
6116, 6157, 6254

Social Perception
5425, 5857, 6081, 6086, 6130, 6134, 6148,
6149, 6163, 6174, 6192, 6193, 6211, 6216,
6218, 6220, 6222, 6226, 6228, 6229, 6230,
6231, 6232, 6233, 6234, 6235, 6236, 6237,
6238, 6239, 6240, 6241, 6242, 6299, 6315,
6316, 6354, 6588, 6633, 6647, 6728, 6777,
6798, 6952, 7082, 7145

Social Power (SEE Social Influence, Inter-
personal Influence, Social Movements)

Social Psychiatry (SEE Psychiatry, Social
Processes)

Social Psychology
6107, 6109, 6110

Social Reinforcement (SEE Reinforcement/
Social)

Social Role (SEE Role)

Social Science

Social Structure (see also Socioeconomic
Status)
6151, 6174, 6951, 7000

Social Welfare (SEE Social Casework)

Socialization
6008, 6111, 6113, 6129, 6136, 6633, 6751,
6773

Society (SEE Culture)

Socioeconomic Status (see also Social Struc-
ture)
6019, 6047, 6055, 6072, 6080, 6083, 6091,
6096, 6100, 6124, 6125, 6126, 6127, 6156,
6306, 6430, 6687, 6776, 6787, 6792, 6871,
6885, 6888, 6893, 6904, 6941, 6946, 6951,
7003, 7020, 7026, 7036, 7041, 7053, 7064,

BRIEF SUBJECT INDEX

7067

Sociology
6398, 6913

Sociometric Status (SEE Social Approval)

Sociometry (SEE Social Approval)

Sociopathy (SEE Behavior Problems, Crime & Criminals, Antisocial Behavior)

Sodium Chloride (SEE Food, Biochemistry)

Soldier (SEE Personnel/Military)

Somesthesia (see also Kinesthesia, Cutaneous Sense)
5333, 5334, 5381, 5404, 5737, 5748, 5793, 6718, 6825, 6900, 6978

Sorting (SEE Categorical Behavior)

Sound (see also Audition, Noise)
5390, 5392, 5400, 5487, 5708, 5744, 5751, 5937, 5949, 6858, 6866

Space Flight (SEE Aviation, Environment, Simulation)

Space Orientation (SEE Orientation)

Space Perception (SEE Perception/Space)

Special Education (SEE Education/Special)

Speech (see also next headings, Verbal Behavior)
5218, 5290, 5395, 5397, 5504, 6021, 6023, 6172, 6218, 6223, 6245, 6256, 6258, 6723, 6764, 6878

Speech Perception
5301, 5389, 5395, 5396, 5398, 6846, 6878

Speech Therapy
6766, 6771, 6825, 6829, 6833, 6988

Speech/Defective (see also Speech Therapy, Stuttering)
6412, 6766, 6768, 6771, 6822, 6823, 6825, 6829, 6831, 6832, 6833, 6834, 6835, 6878, 6981, 6982, 6983, 6988

Speed (SEE Movement)

Spiral Aftereffect (SEE Aftereffect)

Sports (SEE Recreation, Education/Physical)

Stammering (SEE Stuttering)

Stanford-Binet Intelligence Scale (SEE Test/Intelligence)

Startle (SEE Response)

Statistics (see also Mathematics, Factor Analysis)
5213, 5221, 5222, 5223, 5224, 5225, 5226, 5227, 5228, 5229, 5231, 5232, 5233, 5235, 5236, 5237, 5239, 5240, 5241, 5242, 5243, 5244, 5245, 5246, 5247, 5248, 5249, 5251, 5253, 5255, 5258, 5259, 5260, 5261, 5262, 5263, 5265, 5267, 5282, 5310, 5335, 5569, 5573, 5596, 6378, 6585, 6774, 6972, 7030, 7116, 7136

Status (SEE Social Structure, Socioeconomic Status)

Stereotype (see also Attitude)
6018, 6130, 6142, 6163, 6189, 6230, 6238, 6956

Stimulant (SEE Drugs)

Stimulation
5344, 5349, 5367, 5593, 5710, 5724, 5748, 5753, 5812, 5896, 5913, 6011, 6650, 6839, 6862, 6892, 6962

Stimulation/Central (SEE Brain Stimulation, Rat/Brain Stimulation in)

Stimulus
5283, 5336, 5368, 5377, 5442, 5447, 5451, 5455, 5462, 5467, 5687, 5692, 5722, 5738, 5903, 5928, 5929, 5935, 5954, 6864

Stimulus Generalization (SEE Generalization)

Stimulus Intensity (see also Shock & Shock Intensity)
5386, 5394, 5401, 5716, 5731, 5911, 5993, 6824, 6828

Strategy
5353, 5445, 5459, 5533, 5560, 5561, 5570, 6046, 6204, 6215, 6315, 6340, 6972

Stress (see also Conflict, Stress/Physiological, Rat/Stress Effects in)
5411, 5420, 5437, 5444, 5851, 5862, 6077, 6108, 6195, 6205, 6291, 6294, 6417, 6512, 6566, 6651, 6681, 6688, 6754, 6756, 6830, 6935, 7137, 7151

Stress/Physiological
5413, 5770, 5846, 5849, 5850, 6108, 6512, 6935, 7153

Stroke (SEE Brain Disorder, Cardiovascular

Disorders

Strong Vocational Interest Blank (SEE Occupational Interest)

Student (see also next headings, School Dropout)
5270, 5388, 6135, 6165, 6280, 6298, 6953, 7070, 7094

Student Attitude (SEE Attitude/Student)

Student Dropout (SEE School Dropout)

Student Protest (SEE Social Movements, Attitude/Student)

Student Teacher (SEE Teacher Training)

Student/College (see also Achievement/Academic-College)
5199, 5977, 6116, 6134, 6140, 6145, 6270, 6271, 6298, 6343, 6369, 6488, 6604, 6689, 6777, 6944, 6959, 6961, 6986, 7018, 7021, 7029, 7042, 7051, 7089, 7124

Student/College-Attitude
6162, 6236, 6266, 6271, 6945, 6946, 6948, 6951, 6956, 6958, 6963, 7083

Student/College-Personality
5411, 5571, 6095, 6144, 6302, 6347, 6366, 6700, 6946, 6955, 6958, 7027, 7028

Student/Elementary School (see also Childhood & Children, Achievement/Academic-Elementary School)
6037, 6068, 6890, 6947, 6957, 6967, 6971, 6973, 6976, 6984, 7017, 7023, 7026, 7041, 7049, 7053, 7084, 7085, 7100, 7102, 7113

Student/Gifted (SEE Gifted)

Student/Graduate
5197, 6162, 6419, 6423, 6430, 6435, 7019, 7042

Student/High School (see also Adolescence)
6096, 6100, 6170, 6241, 6269, 6314, 6351, 6941, 6954, 6970, 6996, 7020, 7024, 7056, 7068, 7071, 7079, 7082, 7089, 7091

Student/Junior High School (see also Adolescence)
6079, 6133, 6341, 6949, 6984, 7022, 7050, 7054, 7071, 7089, 7103

Stuttering (see also Speech/Defective)
5432, 6830, 6833

Subception (SEE Perception, Visual Perception)

Subliminal Perception (SEE Perception, Visual Perception, Threshold)

Submission (SEE Dominance, Interpersonal Influence)

Suburbs (SEE Urban & Suburban Environment)

Success (SEE Achievement)

Sucking (SEE Instinctive Behavior)

Suggestibility (SEE Hypnosis, Personality Trait)

Suicide (see also Death)
6564, 6574, 6618, 6619, 6620, 6621, 6622, 6623, 6624, 6625, 6678, 6800, 6923

Superego (SEE Psychoanalytic Theory)

Supervision (SEE Leadership, Management)

Surgery (see also Medicine)
6592, 6641, 6846, 6878, 6906

Survey (see also Inventory, Questionnaire, Scale, Testing Methods)
6191, 6521, 6559

SVIB (SEE Occupational Interest)

Symbol & Symbolism (SEE Meaning, Communication, Language)

Sympathetic Nervous System (SEE Nervous System/Autonomic)

Symposium
5196, 5594, 5707, 6112, 6398, 6439, 6500, 6894, 6913, 7106

Symptom (see also Diagnosis, Psychodiagnostics)
5858, 6393, 6395, 6399, 6554, 6582, 6600, 6666, 6683, 6758, 6760, 6818, 6842

Syntax (see also Grammar)
5398, 5440, 5488, 5515, 6028, 6038

Systems Analysis (SEE Organizational Structure)

Tactile (SEE Cutaneous Sense)

Talent (SEE Ability)

Target (SEE Engineering Psychology, Military)

Task
5429, 5539, 6140, 6204

Taste (see also Food)
5646, 5673, 5683, 5768, 6672

Teacher
6113, 6162, 6179, 6230, 6936, 6996, 7026, 7031, 7034, 7036, 7040, 7047, 7049, 7082

Teacher Attitudes & Personality
6174, 6915, 6960, 6979, 7033, 7037, 7038, 7039, 7044, 7046, 7052

Teacher Training
7002, 7006, 7014, 7033, 7035, 7036, 7037, 7041, 7042, 7043, 7044, 7045, 7048

Teaching (see also next headings)
6065, 6942, 6960, 7035, 7043, 7048, 7093, 7100, 7104

Teaching Aids (see also Programed Instruction)
6864, 6993, 6994, 7002, 7039, 7060

Teaching Method (see also Programed Instruction)
5200, 6436, 6603, 6820, 6903, 6989, 7009, 7035, 7050, 7063, 7097, 7099, 7101, 7102

Teaching/Television (SEE Television)

Team Teaching (SEE Teaching Method)

Telepathy (SEE Parapsychology)

Television
5329, 6440, 6446, 6579, 6580, 7098

Television/Educational (SEE Television)

Temperature
5408, 5605, 5696, 5798, 5847, 5849, 5853, 5889

Temperature Sense (SEE Cutaneous Sense)

Tension (SEE Conflict, Stress, Anxiety)

Terrestrial Behavior (SEE Instinctive Behavior)

Test & Testing (see also next headings, Projective Technique, specific tests)
5201, 5231, 5270, 5272, 5273, 5274, 5275, 5276, 5277, 5396, 5441, 5739, 5859, 6000, 6044, 6061, 6206, 6229, 6308, 6348, 6406, 6407, 6586, 6595, 6854, 6947, 6964, 6969, 6970, 6971, 6980, 7073, 7080, 7107, 7108, 7119

Test Anxiety
6955, 6960, 7028

Test/Ability (SEE Test/Aptitude)

Test/Achievement
6407, 6946, 6950, 6966, 6971, 7054, 7065, 7066, 7073

Test/Aptitude
5199, 5271, 5854, 6014, 6068, 6069, 6944, 6974, 7062, 7072, 7074, 7076, 7113

Test/Intelligence
6000, 6069, 6103, 6332, 6334, 6335, 6336, 6337, 6407, 6807, 6967, 6969, 6976, 6980, 7062, 7067, 7072, 7073, 7117

Test/Personality
5410, 5448, 6026, 6128, 6130, 6135, 6144, 6196, 6197, 6240, 6287, 6301, 6303, 6304, 6308, 6313, 6330, 6337, 6339, 6342, 6343, 6344, 6346, 6352, 6353, 6355, 6357, 6360, 6363, 6366, 6407, 6419, 6488, 6612, 6633, 6637, 6675, 6777, 6946, 6950, 6958, 7023, 7027, 7038, 7039, 7042, 7056, 7068, 7074, 7089, 7156

Testing Methods
5271, 5272, 6169, 6349, 6351, 6378, 6995

Thalamus
5640, 5656, 5679, 5682, 5730, 5824

Thematic Apperception Test (SEE Projective Technique)

Theory (see also Learning Theory, Personality Theory, Psychoanalytic Theory, Information Theory, Motivation Theory, Reinforcement Theory)
5184, 5187, 5189, 5192, 5220, 5234, 5238, 5240, 5252, 5311, 5348, 5414, 5415, 5416, 5491, 5500, 5766, 5875, 5963, 6031, 6115, 6167, 6183, 6214, 6235, 6243, 6382, 6390, 6444, 6512, 6692, 6938, 7147, 7155

Therapeutic Community (SEE Community, Psychotherapy/Methods in)

BRIEF SUBJECT INDEX

Therapeutic Process (see also Empathy)

5902, 6428, 6457, 6459, 6462, 6465, 6466, 6471, 6472, 6473, 6474, 6475, 6476, 6478, 6479, 6481, 6802, 6806

Therapist

6425, 6428, 6452, 6455, 6457, 6463, 6465, 6472, 6473, 6474, 6476, 6478, 6484, 6490, 6499, 6501, 6505

Therapy (see also Behavior Therapy, Drug Therapy, Family Therapy, Psychiatry, Psychoanalysis, Psychotherapy, Speech Therapy, Treatment, Schizophrenia/Treatment of, Mental Retardation/Treatment of, Case Report-Treatment, Electroconvulsive Shock Therapy, Treatment/Outpatient, Psychiatric Patient Treatment, Occupational & Physical Therapy)
6449, 6559, 6853, 6858, 6923

Thinking (see also Cognition, Logic, Categorical Behavior)

5184, 5187, 5190, 5532, 5539, 5546, 5551, 5552, 5553, 5558, 5990, 6058, 6060, 6301, 6308, 6341, 6343, 6801, 6819, 6954, 7055, 7061, 7103, 7121, 7122

Thirst (SEE Water & Water Intake, Deprivation, Motivation)

Threat

5421, 5444, 5848, 6207, 6311

Threshold

5327, 5342, 5351, 5368, 5387, 5401, 5402, 5405, 5609, 5610, 5676, 5683, 5692, 5708, 5721, 5828, 5912, 6650, 6702

Time (see also Perception/Time, Reaction Time)

5182, 5325, 5340, 5433, 5439, 5464, 5501, 5531, 5969, 6047, 6124, 6234, 6301, 6361, 6620, 7019

Time Estimation

5321, 5322, 5584

Time Interval Effects (SEE Interval/Time, Interval/Interstimulus)

Token (SEE Reinforcement)

Tone (SEE Sound)

Touch (SEE Cutaneous Sense)

Tracking (SEE Visual Perception)

Training (see also Teacher Training)

5284, 5295, 5370, 5392, 5413, 5436, 6015, 6027, 6190, 6196, 6203, 6419, 6422, 6675, 6974, 6985, 7029, 7032, 7085, 7090, 7118, 7123, 7126, 7142

Training/Industrial & Military

5434, 6104, 6959, 7112, 7119

Training/Psychology

5196, 5197, 5198, 5200, 5201, 5202, 5203, 5207, 6402, 6410, 6419, 6420, 6421, 6423, 6424, 6425, 6427, 6431, 6432, 6435, 6436, 6438, 6466, 6916, 7019

Training/Teacher (SEE Teacher Training)

Trait (SEE Personality Trait)

Tranquillizer (see also Drug Therapy, Chlorpromazine)

5781, 6509, 6511, 6516, 6517, 6525, 6529, 6535, 6537, 6543, 6549, 6557, 6644, 6732, 6737, 6740, 6741, 6744, 6746, 6748, 6749, 6762

Transfer (see also Generalization, Learning Transfer)

5306, 5937, 6038

Transference (SEE Therapeutic Process, Interpersonal Processes)

Transsexualism (SEE Sexual Deviation)

Transvestism (SEE Sexual Deviation)

Trauma (SEE Stress, Emotion)

Treatment (see also Therapy, Schizophrenia/Treatment of, Case Report-Treatment, Mental Retardation/Treatment of)
6408, 6434, 6471, 6521, 6540, 6603, 6615, 6655, 6678, 6689, 6812, 6817, 6831, 7001, 7028

Treatment/Outpatient

6508, 6510, 6519, 6537, 6538, 6543, 6547, 6558, 6639, 6656, 6750, 7157

Trust (SEE Interpersonal Processes, Social Perception)

Tuberculosis (SEE Disease)

Twins (see also Genetics, Family Relations)
6676, 6771, 6872

Ulcer (SEE Illness)

Unconscious (SEE Motivation, Conscious States, Psychoanalytic Theory)

Underachievement (SEE Achievement/Over & Under)

Underdeveloped Countries (SEE Cultures & Countries)

Undergraduates (SEE Student/College)

Underprivileged (SEE Socioeconomic Status, Childhood/Disadvantaged)

Underwater Environment (SEE Environment)

Unemployment (SEE Personnel/Industrial, Socioeconomic Status)

Union (SEE Personnel/Industrial)

United States

6129, 6130, 6133, 6134, 6135, 6138, 6139, 6140, 6143, 6144, 6262, 6367, 6821, 7101, 7128

University (SEE College, Student/College)

Unwed Mother (SEE Pregnancy, Mother)

Urban & Suburban Environment (see also Community, Rural Environment)

6022, 6137, 6154, 6180, 6780, 6788, 6794

Urination (SEE Elimination)

USSR

5574, 5587, 5588, 5589, 6109, 6129, 6248, 6608, 6836, 6837, 6838, 6851

Validity

5199, 5201, 5276, 5596, 5848, 6164, 6231, 6254, 6279, 6347, 6356, 6359, 6597, 6706, 6947, 6968, 6970, 7113

Validity/Construct (SEE Validity)

Value & Values

5283, 6045, 6080, 6082, 6095, 6129, 6138, 6174, 6209, 6236, 6240, 6330, 6437, 6924, 6939

Variance/Analysis of (SEE Statistics)

Vascular & Vasomotor (SEE Cardiovascular Processes)

Verbal Ability (SEE Ability, Verbal Behavior)

Verbal Behavior (see also Communication, Speech, Vocalization)

5276, 5338, 5398, 5407, 5423, 5468, 5480, 5504, 5506, 5535, 5545, 5558, 5586, 5848, 5866, 5985, 6005, 6012, 6056, 6059, 6086, 6094, 6133, 6191, 6220, 6224, 6259, 6310, 6343, 6363, 6702, 6704, 6826, 6870, 7002, 7014, 7040, 7044, 7059

Verbal Conditioning (SEE Learning/Verbal)

Verbal Learning (SEE Learning/Verbal)

Verbal Mediation (SEE Mediation)

Verbal Reinforcement (SEE Reinforcement/Social)

Vestibular Sense (SEE Somesthesia)

Vibration (SEE Cutaneous Sense, Stress, Stimulation)

Vigilance (SEE Arousal, Attention)

Violence (SEE Aggression, Conflict, Hostility)

Vision (SEE also next headings, Eye, Eye Movement, Retina, Intersensory Processes)

5216, 5323, 5324, 5325, 5326, 5327, 5328, 5329, 5330, 5331, 5333, 5334, 5349, 5356, 5364, 5373, 5380, 5382, 5384, 5399, 5403, 5499, 5504, 5611, 5613, 5625, 5710, 5720, 5732, 5745, 5746, 5750, 5763, 5793, 5973, 5974, 5985, 5994, 5996, 6060, 6408, 6466, 6721, 6731, 6764, 6809, 6811, 6869, 6999, 7070

Vision/Binocular (SEE Vision, Perception/Depth)

Vision/Color (SEE Color Vision)

Vision/Defective

5856, 6025, 6761, 6809, 6812, 6815, 6816, 6817, 6868, 6883, 6995

Vision/Physiology of

5216, 5761, 5765, 5766

Visual Adaptation (SEE Adaptation/Sensory)

Visual Aftereffect (SEE Aftereffect)

Visual Cortex

5329, 5599, 5615, 5624, 5654, 5719, 5726, 5733, 5734, 5752, 5761, 5766

Visual Discrimination

5270, 5306, 5332, 5359, 5362, 5363, 5368, 5369, 5372, 5375, 5379, 5386, 5419, 5791, 6027, 6073, 6329

Visual Field

5330, 5337, 5353, 5358, 5360, 5365, 5368, 5376, 5386, 5387, 5521, 5625, 5991, 6048, 6075

Visual Illusion (SEE Illusion)

Visual Perception (see also Illusion, Perception, Color Vision)

PSYCHOLOGY

and
the
problems
of
society

"Moreover, there is nothing in the definition of psychology that dedicates our science to the solution of social problems Our obligations as citizens, however, are considerably broader than our obligations as scientists. When psychological issues are raised in this broader context, we cannot evade them by complaining that they are unscientific."

(Quoted from George A. Miller's Presidential Address to the American Psychological Association—Washington, D. C. Sept. 1969)

Invited addresses (22) and symposia (5) presented at the 77th (1969) Annual Convention of the American Psychological Association. The views and opinions expressed by psychologists, philosophers, sociologists, educators, economists, lawyers and government officials, concerning seven major problem areas of today:

- Psychology and the Social Change Process
- Psychology and Urban Problems
- Psychology and the Challenge of Early Learning
- Psychology and the Minority Groups
- Psychology and the Reduction of Violence
- Psychology and Campus Issues
- Psychology and Society's Future

A constructive and dynamic look at a troubled society.

Ed. by: F. F. Korten, S. W. Cook, and J. I. Lacey

Pages: 450

Price: \$6.00

Journals of the AMERICAN PSYCHOLOGICAL ASSOCIATION

SUBSCRIPTION RATES FOR CALENDAR YEAR 1971

AMERICAN PSYCHOLOGIST. Official papers of the Association and articles of general interest to psychologists. Monthly. 1971 volume is Vol. 26. Subscription: \$10.00 (foreign \$10.50). Single copy \$1.00.

CONTEMPORARY PSYCHOLOGY. Critical reviews of books, films and research material in the field of psychology. Monthly. The 1971 volume is Vol. 16. Subscription: \$10.00 (foreign \$10.50). Single copy \$1.00.

JOURNAL OF ABNORMAL PSYCHOLOGY. Theoretical and research conditions in behavior pathology. Bimonthly; first issue — February. Two volumes per year, three issues per volume. The 1971 volumes are Vols. 77 and 78. Subscription: \$20.00 for 2 vols. (foreign \$20.50). Single copy \$4.00.

JOURNAL OF APPLIED PSYCHOLOGY. Applications of psychology in business and industry. Bimonthly; first issue — February. The 1971 volume is Vol. 55. Subscription: \$10.00 (foreign \$10.50). Single copy \$2.00.

JOURNAL OF COMPARATIVE AND PHYSIOLOGICAL PSYCHOLOGY. Original contributions in the field of comparative and physiological psychology. Monthly. Four volumes per year, three issues per volume. The 1971 volumes are Vols. 74, 75, 76 and 77. Subscription: \$40.00 for 4 vols. (foreign \$40.50). Single copy \$4.00.

JOURNAL OF COUNSELING PSYCHOLOGY. A primary publication medium for research in counseling theory and practice. Bimonthly; first issue — January. The 1971 volume is Vol. 18. Subscription: \$10.00 (foreign \$10.50). Single copy \$2.00.

JOURNAL OF CONSULTING AND CLINICAL PSYCHOLOGY. Research in clinical psychology: psychological diagnosis, psycho-therapy, personality, psychopathology. Bimonthly; first issue — February. Two volumes per year, three issues per volume. The 1971 volumes are 36 and 37. Subscription: \$20.00 for 2 vols. (foreign \$20.50). Single copy \$4.00.

JOURNAL OF EDUCATIONAL PSYCHOLOGY. Studies of learning and teaching: measurement of psychological development, psychology of school subjects, methods of instruction, school adjustment. Bimonthly; first issue — February. The 1971 volume is Vol. 62. Subscription: \$10.00 (foreign \$10.50). Single copy \$2.00.

JOURNAL OF EXPERIMENTAL PSYCHOLOGY. Original experimental investigations that contribute toward development of psychology as an experimental science. Monthly. Beginning 1971 five volumes per year. The 1971 volumes are Vols. 87, 88, 89, 90, and 91. Subscription: \$50.00 for 5 vols. (foreign \$50.50). Single copy \$5.00.

JOURNAL OF PERSONALITY AND SOCIAL PSYCHOLOGY. Theoretical and research papers on personality dynamics, group process, and the psychological aspects of structure. Monthly. Beginning in 1971: four volumes per year, three issues per volume. The 1971 volumes are Vols. 17, 18, 19 and 20. Subscription: \$40.00 for 4 vols. (foreign \$40.50). Single copy \$4.00.

PSYCHOLOGICAL ABSTRACTS. Noncritical abstracts of the world's literature in psychology and related subjects. Monthly. Approximately 22,000 abstracts published annually. Beginning in 1971 two volumes per year. Separate index for each volume. The 1971 volumes are Vols. 45 and 46. Subscription: \$130.00 (\$132.00 foreign).

PSYCHOLOGICAL BULLETIN. Evaluative reviews of research literature, discussions of research methodology in psychology. Monthly. Two volumes per year, six issues per volume. The 1971 volumes are Vols. 75 and 76. Subscription: \$20.00 for 2 vols. (foreign \$20.50). Single copy \$2.00.

PSYCHOLOGICAL REVIEW. Original contributions of a theoretical nature. Bimonthly; first issue — January. The 1971 volume is Vol. 78. Subscription: \$10.00 (foreign \$10.50). Single copy \$2.00.

DEVELOPMENTAL PSYCHOLOGY. Studies on growth and development and their associated variables. Bimonthly; first issue — January. Two volumes per year, three issues per volume. The 1971 volumes are Vols. 4 and 5. Subscription: \$20.00 for 2 vols. (\$20.50 foreign). Single copy \$4.00.

PROFESSIONAL PSYCHOLOGY. Devoted to the application of principles and skills in a wide variety of settings: clinics, hospitals, schools, industry, government, and independent practice. Quarterly; one volume per year. The 1971 volume is Vol. 2. Subscriptions: \$10.00 (foreign \$10.50). Single copy \$3.00.

DISCOUNTS: AGENTS and BOOK DEALERS receive a 10% discount on all orders. There is no club arrangement. There are no quantity, cash, library, or other special discounts. Payment in U.S. funds.

Subscriptions are available on a January through December basis only

A READER'S GUIDE TO USING PSYCHOLOGICAL ABSTRACTS

Psychological Abstracts (PA) attempts to cover the world's literature in psychology and related topics. PA publishes abstracts of published primary documents such as technical reports, journals, and monographs. Books and separates are covered by bibliographic citation with an additional annotation if the title is not definitive.

PA is published in two volumes per year (effective January 1971), six issues per volume. A cumulative index is published for each six-month volume.

A monthly issue contains: Table of Contents (classification scheme); abstracts; list of abbreviations used in the abstracts; Author Index; and Brief Subject Index. The Brief Subject Index consists of index heading terms and abstract numbers.

A cumulative index issue contains: Table of Contents for the six-month volume; complete list of all journals regularly searched by PA; list of volunteer abstractors; list of abbreviations used in the abstracts; the cumulative author index for the six-month volume; list of subject index heading terms; and cumulative subject index for the six-month volume, which consists of index heading terms, descriptive phrases for each abstract, four-letter abbreviations indicating languages other than English and abstract numbers.

Within the monthly issue, abstracts are arranged in alphabetical order by author, categorized under the content headings as listed in the Table of Contents. The abstracts are numbered consecutively within a six-month volume.

PA's author index is intended to be a name index only and not a person index. Alphabetical rules are strictly applied, consequently, "J. Smith" and "John Smith" would appear in the index as two separate entries even though they may in fact be the same person. By the same token two entries of "J. Smith" would appear as J. Smith with two abstract numbers following it, even though they may be two different people.

The subject index heading terms are reviewed annually and revised as necessary as subjects of interest to the discipline shift and increase. For example, the term "Drug Usage and Abuse" was added to the list of terms when the increase of articles on the topic and interest in the discipline appeared to demand it. Previous to the addition of this term these articles were placed under terms such as "Drugs," "Drug Effects," "Drug Therapy," and "Drug Addiction." Conversely, as a topic decreases in popularity, it may become necessary to delete a term or combine several terms into one general term.

PA is computer-printed and because of necessary production procedures there is a possibility that on occasion the abstracts representing articles from a single issue of a primary journal may appear in several issues of PA, e.g., an issue of the *Journal of Psychology* may include 20 relevant articles; abstracts for 17 of these articles may appear in the May issue of PA, the other 3, in the June issue.

The following are examples of entries and explanations of their elements.

JOURNAL ARTICLE ENTRY

(1a) Brown, Mildred; (1b) Jones, John J., (1c) Wilson, J. T., & (1d) Carson, E. Norman. (2) (*Boston U.*) (3) Single cell activity in the hypothalamus in intact and adrenalectomized rats. (4) *Psychological Journal*, (5a) 1970(Jan), (5b) Vol. 13(6), (5c) 173-190.—(6) In this replication of a study by A. R. Arnold (7) (see (7a) PA, (7b) Vol. 42: (7c) 1791 and 45: (7d) Issue 1), 123 intact and adrenalectomized male Wistar rats were tested under urethane anesthesia. Adrenalectomy increased the mean spontaneous discharge and changed the pattern of firing of anterior hypothalamic neurons. The possible relation of these electrophysiological findings to the effects of adrenalectomy on the CNS is discussed. (8) (German & French summaries) (9) (97 ref.).—(10) *Journal abstract.*

1a-1d—Authors: Only four are listed; if there are more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address: A mailable address is included for the first-named author only.

3—Title: Article title including subtitles. If the original article is in a foreign language, that title is given, followed by the English translation in brackets, e.g., [Parapsychology].

4—Primary journal title in full.

5a—Year and month of the primary publication issue.

5b—Volume number followed by issue number in parentheses.

5c—Inclusive pagination of the article.

6—Text of the abstract.

7—Reference to a previous entry in *Psychological Abstracts*.

7a—PA—*Psychological Abstracts*.

7b—PA volume number.

7c—PA abstract number.

7d—PA issue number where abstract number is unavailable at time of publication. When only the issue number is given, one must consult the Author Index of the PA issue noted in order to determine the abstract number for the author and article cited.

8—Summaries included in the primary source are listed when in language(s) other than that of the article.

9—Number of references is included when 15 or more. May also appear as pages, e.g., (3 p. ref.).

10—Abstract source.

BOOK ENTRY

(1) Jones, John J. (2) (Ed.) (3) (*U. Chicago, Medical School*) (4) *Sleep and dreams*. (5) New York, N.Y.: (6) Appleton-Century-Crofts, (6a) 1970. (6b) ix, (6c) 396 p. (6d) \$6.50(cloth), (6e) \$2.50(paper).

1—Name of author(s) or editor(s). If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Designation of editor.

3—Address of first-named author/editor only.

4—Book title.

5—Place of publication.

6—Publisher's name.

6a—Year of publication.

6b—Prepagination.

6c—Total pagination.

6d—Hardcover price.

6e—Paperback price.

BOOK CHAPTER ENTRY

(1) Wilson, J. T. (2) (*U. California, Santa Cruz*) (3) *The stages of sleep*. (4) In (4a) J. J. Jones (4b) (Ed.), (4c) "Sleep and dreams." (5) (See (5a) PA, (5b) Vol. 45: (5c) Issue 1) (6) 17-47.

1—Author(s) of chapter cited. If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address of first-named author only.

3—Chapter title.

4—Reference to entry in PA which includes bibliographic information for the whole book. When only the issue number is given (see 5c), one must consult the Author Index of the PA issue noted in order to determine the abstract number for the Editor of the book.

4a—Editor's name.

4b—Editor designation.

4c—Book title.

5—Referral information.

5a—PA—*Psychological Abstracts*.

5b—Volume number.

5c—Issue number.

6—Inclusive pagination for cited chapter.

ABBREVIATIONS

Abbreviations appearing in this issue include along with units of measurement (e.g., in. = inch, wk. = week, hr. = hour, etc.):

AA = Alcoholics Anonymous
AC = alternating current
ACTH = adrenocorticotrophic hormone
AM = ante meridiem
amp. = ampere

bpm = beats per minute

C = centigrade
¢ = cents
CA = chronological age
cc = cubic centimeter
CFR = conditioned emotional response
CFP = critical flicker frequency
CNS = central nervous system
cps = cycles per second
CR = conditioned response (or reflex)
CRF = continuous reinforcement
CRT = cathode ray tube
CS = conditioned stimulus
CVC = consonant-vowel-consonant

db. = decibel
DC = direct current
DL = differential limen
DNA = deoxyribonucleic acid
DRL = differential reinforcement of low rates

E = experimenter
ECS = electroconvulsive shock
EEG = electroencephalogram (or -graphy)
EKG = electrocardiogram
EMG = electromyogram
ESP = extrasensory perception
Exp. = experiment

F = Fahrenheit
ft-c = foot-candle
ft-l. = foot-lambert

g = gravity
gm. = gram(s)
GPA = grade-point average
GSR = galvanic skin response

Hz. = Hertz

ICS = intracranial stimulation
im = intramuscularly
ip = intraperitoneally
IQ(s) = intelligence quotient(s)
ITI = intertrial interval
iv = intravenously

kc. = kilocycle
kg. = kilogram
kg/m = kilogram per meter
kHz. = kilo-Hertz

LD = lethal dose
LSD = lysergic acid diethylamide

m. = meter
M = mean
M = mole or molar
ma. = milliamperes
MA = mental age
MAO = monoaminooxidase
mL. = milliliter
mm. = millimeter
mph = miles per hour
msec. = millisecond(s)

N = number
NREM = nonrapid eye movement

O = observer

p = probability
% = percent

PM = post meridiem
pps = pulses per second
PRE = partial reinforcement effect
PSE = point of subjective equality
psi = pounds per sq. in.

r = product-moment correlation
r = roentgen
REM = rapid eye movement
rms = root mean square
RNA = ribonucleic acid
rpm = revolutions per minute
RT = reaction time

S = subject
SEU = subjectively expected utility
SPL = sound pressure level

TV = television

UCR = unconditioned response
UCS = unconditioned stimulus
UHF = ultrahigh frequency

V = volt
VHF = very high frequency
vs. = versus

YMCA = Young Men's Christian Association
YWCA = Young Women's Christian Association

Test abbreviations include:

California E Scale (Ethnocentrism)
California F Scale (Fascism)
CMA scale = Children's Manifest Anxiety scale
CPI = California Psychological Inventory
CTMM = California Test of Mental Maturity
EPPS = Edwards Personal Preference Schedule
MA scale = (Taylor) Manifest Anxiety scale
MMPI = Minnesota Multiphasic Personality Inventory
MPI = Maudsley Personality Inventory
16 PF = Cattell's 16 Personality Factor Questionnaire
SVIB = Strong Vocational Interest Blank
TAT = Thematic Apperception Test
WAIS = Wechsler Adult Intelligence Scale
WISC = Wechsler Intelligence Scale for Children

Abbreviations used in authors' addresses are:

Assn. = association
Assoc. = associates
Co. = company
Coll. = college
Corp. = corporation
Dept. = department
Div. = division
Inst. = institute
Hosp. = hospital
Lab. = laboratory
Inc. = incorporated
U. = university

Ave. = avenue
Bldg. = building
Blvd. = boulevard
Ct. = court
Dr. = drive
Ft. = fort
Mt. = mount
Pkwy. = parkway
Pl. = place
PO = post office
Rd. = road
St. = street
N, S, E, W = North, South, East, West
U.S. = United States
USSR = Union of Soviet Socialist Republic

Psychological Abstracts

VOLUME 45

MAY 1971

NUMBER 5

ERRATA

With the January 1971 issue of *Psychological Abstracts*, a new production procedure was instituted. As with any new system, it was not possible to anticipate all problems. The following corrects errors which occurred in the January-April issues.

In PA, Vol. 45:713, the author should have been listed as: **Braun, John R.**

In PA, Vol. 45:2555, the journal information should have been listed as: *Nervenarzt*, 1968(Oct), Vol. 39(10), 468-473.

In PA, Vol. 45:2723, the correct journal title is: *Ricerca Scientifica*.

In PA, Vol. 45:3191, the journal information should have been listed as: *Ergonomics*, 1969(Nov), Vol. 12(6), 903-911.

In PA, Vol. 45:3894, the correct journal title is: *Monographs for the Society for Research in Child Development*.

In PA, Vol. 45:4426, the author is: **Arce, Luis.**

In PA, Vol. 45:4584, the journal title should have been listed as: *Comprehensive Psychiatry*.

In PA, Vol. 45:5092, the author is: **Lindell, E.**

In PA, Vol. 45:5137, the author is: **Haggard, Donald F.**

In PA, Vol. 45:5979, the correct journal title is: *American Journal of Psychology*.

In PA, Vol. 45:6400, 6640, 6649, and 6739, the journal information should have been listed as: Vol. 73(3, Pt. 1).

GENERAL

7158. **Kirshenblat, Ya. D.** *Praktikum po endokrinologii*. [Practicum on endocrinology.] Moscow, USSR: Vysshaya Shkola, 1969. 256 p.—Presents a manual, which contains guides to surgical and experimental procedures involving the nervous system and neurohormones of insects.—*I. D. London.*

7159. **Craik, Kenneth H., et al.** (U. California, Berkeley) *New directions in psychology: IV*. New York, N.Y.: Holt, Rinehart, & Winston, 1970. viii, 382 p. \$3.95(paper).

OBITUARIES

7160. **Arlo, Jacob A. Heinz Hartmann 1894-1970.** *Psychoanalytic Quarterly*, 1970(Oct), Vol. 39(4), 620-621.—Obituary.—*J. Z. Elias.*

HISTORY

7161. **Carini, Louis.** (Bennington Coll., Div. of Social Sciences) *A reassessment of Max Wertheimer's contribution to psychological theory.* *Acta Psychologica*, Amsterdam, 1970(Aug), Vol. 32(4), 377-385.—*M.* Wertheimer founded Gestalt psychology on a physiological principle later to be called isomorphism, and in doing so he reformulated the nature of explanation of perceptual phenomena. That this explanation applies to

all perceptual phenomena is shown by an examination of D. W. Hamlyn's mistaken notions that veridical perception is a valid concept and that veridical perception cannot be given a psychological explanation of a scientific kind. The view of W. M. O'Neil and A. A. Landauer that Wertheimer's contribution is more a polemical rallying point than a theoretical turning point is examined and criticized as misunderstanding the axiomatic nature of Wertheimer's explanation for all percepts, and for inadvertently interposing their own elementaristic theory in its stead. The elementaristic theory cannot, however, explain phi-phenomena, while the axiom of isomorphism, by deduction, can explain them. It is held, finally, that by explaining all perceptual phenomena axiomatically, Wertheimer has given a Copernican twist to the understanding of perception.—*Journal abstract.*

7162. **Košćo, Jozef.** (Comenius U., Bratislava, Czechoslovakia) *Zdroje vývinu európskeho psychologického myslenia a rané kresťanstvo*. [Sources of the development of European psychological thought and early Christianity.] *Psychologica: Sborník Filozofickej Fakulty, U. Komenského, Bratislava*, 1967, Vol. 18(7), 137-159.—Presents an analysis of the development, character, and function of Christianity with regard to its influence on theoretical problems of European psychology. It is believed that the revival of the early Christian ideal of man supports the formation of the interests and sensibility to man's problems, his individuality, and social and metaphysical determination. (Russian & German summaries) (25 ref.)—*English summary.*

7163. **Mischel, Theodore.** (U. Illinois) *Wundt and the conceptual foundations of psychology.* *Philosophy & Phenomenological Research*, 1970(Sep), Vol. 31(1), 1-26. Examines Wundt's conception of psychology in its historical context in an effort to understand psychology's previous attempt at a "science of mind." The fact that psychologists are now very much interested in "awareness," "conscious, volitional control," "expectancy and value theory," etc., suggests that psychology may be in the process of again becoming the study of "mind." (58 ref.)—*L. J. Cantoni.*

7164. **Morrison, James C.** (U. Toronto, Ontario, Canada) *Husserl and Brentano on intentionality.* *Philosophy & Phenomenological Research*, 1970(Sep), Vol. 31(1), 27-46. Endeavors to show that Husserl's phenomenological views are very different from and far more developed than Brentano's. Discussed are (a) Brentano's attempt to distinguish mental and physical phenomena in which he introduces the notion of "intentional inexistence," and (b) Husserl's views both on the general problem of mental vs. physical phenomena and on the more specific one of intentionality. (82 ref.)—*L. J. Cantoni.*

7165. **Munipov, V. M. V. M. Bekhterev.** Moscow, USSR: Meditsina, 1969. 56 p.—Recounts the life and work of Vladimir Mikhailovich Bekhterev (1857-1927),

noted for his contributions to Russian neuropathology, psychiatry, physiology, psychology, and related fields.—*I. D. London.*

7166. **Rumbaut, Ruben D.** (Veterans Administration Hosp., Topeka, Kan.) **A case of the two "Huartes": A historical confusion.** *Bulletin of the Menninger Clinic*, 1970(Sep), Vol. 34(5), 284-291.—Confusion in 2 names exists in the beginnings of psychiatry in Spain in the 16th century: Juan de Dios Huarte de San Juan (with variations) 1530-1591, Spanish, a physician and author of a treatise on modern psychology; and the other, Juan Ciudad Duarte (with variations) 1495-1550, Portuguese and founder of 2 hospitals, who was later made a saint by the Catholic church.—*J. Z. Elias.*

7167. **Rychlak, Joseph F.** (Purdue U.) **The human person in modern psychological science.** *British Journal of Medical Psychology*, 1970(Sep), Vol. 43(3), 233-241.—Reviews the history of science concerning 2 significant issues, both of which take root in Aristotle: (a) the distinction between dialectical and demonstrative reasoning; and (b) the theory of 4 causes in theoretical description. It is shown how the theories of modern natural science have come to restrict the description of human behavior to demonstrative conceptualizations, and to the use of material and efficient causation. Dialectical strategies and the formal-final causes are not considered appropriate theoretical devices in 20th century science. A call is made for the return to the latter constructs in distinguishing modern social from natural science.—*Journal summary.*

7168. **Zutt, J., et al. (Eds.) Karl Bonhoeffer: Zum hundertsten Geburtstag.** [Karl Bonhoeffer: On the occasion of his 100th birthday.] Berlin, W. Germany: Springer-Verlag, 1967. 148 p.—Presents the hitherto unpublished autobiography of the German psychiatrist, K. Bonhoeffer (1868-1949), containing much on the history of German psychiatry in the period 1892-1933. Also included are a necrology and a previously unpublished evaluation of the personality of Hitler.—*I. D. London.*

PHILOSOPHY

7169. **Ag, Atilla.** **Filosofskaya antropologiya Teiyara de Sharden.** [The philosophical anthropology of Teilhard de Chardin.] *Voprosy Filosofii*, 1970, Vol. 24(5), 175-179.—Presents a critical analysis of the philosophical views of T. de Chardin on the nature of man.—*I. D. London.*

7170. **Groeben, Norbert.** (Westfälischen Wilhelms-Universität Münster, W. Germany) **Wissenschaftstheorie zwischen Ideologie und Synthese: Eine kritische Stellungnahme zum Werk von K. Holzkamp: Wissenschaft als Handlung.** [Philosophy of science between ideology and synthesis: A critical view of the work of K. Holzkamp: Science as action.] *Psychologische Beiträge*, 1970, Vol. 12(2), 311-317.—Reviews Holzkamp's works and demonstrates inadequacies in the position of logical empiricism. Numerous examples of the use of inductive logic in scientific theory formation are cited, and criticized. A synthesis of a philosophy of science and a pragmatic relation between this philosophy of science and scientific methodology is suggested. (English & French summaries)—*B. A. Stanton.*

7171. **Prado, C. G.** (Queen's U., Kingston, Ontario, Canada) **A note on Armstrong and the cybernetic model.** *Philosophy & Phenomenological Research*,

1970(Jun), Vol. 30(4), 600-602.—Suggests that the cybernetic model is neither a useful way of thinking about minds nor a device for the hasty reduction of minds to brains. Asserts that D. M. Armstrong in his 1968 book, *A Materialist Theory of the Mind*, has delineated the real issue: Given causal relationships in behavior, how are we to understand such concepts as that of initiating action, of responsibility, of choice?—*L. J. Cantoni.*

7172. **Rauhala, Lauri.** (U. Turku, Finland) **Intentionality and the problem of the unconscious.** *Annales Universitatis Turkuensis, Series B*, 1969, Vol. 110, 222 p.—Investigates "fundamental problems of the unconscious through metascientific analysis... to discover a general philosophical foundation to coordinate the existing divergent approaches." An examination of the philosophical conceptions of man, a survey of the field prior to Freud and Jung, an analysis of depth-psychology, a discussion of the relationship of the analysis of meaning to the problem of the unconscious, and a presentation of the current views are included. The main emphasis is on the views of C. Jung. (10 p. ref.)—*G. Steele.*

7173. **Rauhala, Lauri.** (Merikatu 7. A. II, Helsinki, Finland) **Man: The philosophical conception and empirical study.** *Journal of Analytical Psychology*, 1970(Jul), Vol. 15(2), 148-154.—The philosophical concept of man, in the empirical sciences, has him existing on 4 levels: material, organic, mental, and spiritual. Only the physical analysis of man can clarify the kinds of empirical research necessary for studying the human being.—*P. Federman.*

7174. **Shawver, Lois & Docecki, Paul R.** (U. Houston) **A Wittgensteinian analysis of the role of self-reports in psychology.** *Psychological Record*, 1970(Sum), Vol. 20(3), 289-296.—Presents an argument to prove the usefulness of Wittgensteinian analysis in psychology. The self-report of anger was investigated, and it was determined that anger is a public condition rather than a private experience. It is suggested that Wittgensteinian analysis may uncover "undetected misconstruals of conventional language which lead to unprofitable (or untenable) conclusions....[and] diminish the disagreement and confusion which currently seems to hamper our efforts in solving these [clinical and experimental] problems."—*S. Knapp.*

7175. **Shotter, John.** (U. Nottingham, England) **The philosophy of psychology: The psychological foundations of psychology.** *Bulletin of the British Psychological Society*, 1970(Jul), Vol. 23(80), 207-212.—Philosophical activity is described as actually necessary in psychology and its exorcism, thoughtless. Questions are raised concerning the whole scientific approach currently adopted by psychologists and it is recommended that there must once again be a merger of philosophical and empirical activity. It is also recommended that a philosophy of psychology course be introduced into the academic curriculum.—*V. S. Sexton.*

7176. **Simon, Michael A.** (U. Connecticut) **Materialism, mental language, and mind-body identity.** *Philosophy & Phenomenological Research*, 1970(Jun), Vol. 30(4), 514-532.—Seeks to demonstrate a viable alternative to dualism's bifurcation of being. Believes that the dualist is correct in refusing to accept the thesis that mental events are the same things as brain processes. But a workable monism is preferable to any form of psychophysical dualism. Affirms that mental language is

an effective means of talking about the entities embraced by modern physical and biological science.—L. J. Cantoni.

7177. Van de Vate, Dwight. (Ed.) (U. Tennessee) **Persons, privacy, and feeling: Essays in the philosophy of mind.** Memphis, Tenn.: Memphis State U. Press, 1970. vii, 142 p.

PARAPSYCHOLOGY

THEORY & SYSTEMS

7178. Baird, John C. (Dartmouth Coll.) **A cognitive theory of psychophysics: II. Fechner's law and Stevens' law.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(2), 89-102.—Describes the means by which a cognitive theory can encompass the main facts associated with Fechner's logarithmic law and Stevens' power law. It is proposed that Ss code information in such a way that a variety of psychophysical functions can be obtained with the same stimulus attributes. 4 terms must be defined in order to understand psychophysical equations. These terms are: (a) S's perceptual channel capacity, (b) S's cognitive channel capacity, (c) the E's measure of stimulus information, and (d) the context variables associated with the psychophysical procedure. (29 ref.)—*Journal abstract*.

7179. Bannister, D. (Bexley Hosp., Bexley, England) **Psychological theories as ways of relating to people.** *British Journal of Medical Psychology*, 1970(Sep), Vol. 43(3), 241-244.—Argues that psychological theories are not merely intellectual postulates about people but are stances toward them. On this basis the interpersonal implications of comparative psychology, physiological psychology, eclecticism, learning theory, and psychoanalytical theory are examined. The relationship between values and scientific assumptions in psychology is set out as it presents itself in "personal construct" theory.—*Journal summary*.

7180. Baran, Sybil & Severin, Frank. (National Inst. of Personnel Research, Johannesburg, South Africa) **Science and the study of man.** *Psychological Scene*, 1968(Sep1), Vol. 2, 17-27.

7181. Brandt, Lewis W. (U. Saskatchewan, Regina, Canada) **American psychology.** *American Psychologist*, 1970(Dec), Vol. 25(12), 1091-1093.—Contents that American psychology is the result of American history and ideology. As a consequence it represents doing, trial and error, prediction, and control rather than reflection, reasoning, and understanding or, in Piagetian terms, concrete rather than formal operations. It aims at laws and order and cannot tolerate uncertainty and relativity. The contradictions of the American way of life are reflected in the insistence of psychology on consistency and parsimony and its lack of both. This lack appears most clearly in the failure of American psychology to be applicable to psychologists and in its consequent dichotomy between principles applicable to the functioning of Es and of their Ss. The American feeling of superiority is mirrored in psychology's disregard of non-English language research publications. By being to such an extent an American product American psychology fails, in Piagetian terms, to be relative and thereby objective.—*Author abstract*.

7182. Burton, Arthur. (Sacramento State Coll.) **The authentic person in existential psychology.** *Pastoral*

Psychology, 1969(Mar), Vol. 20(192), 17-26.—Summarizes 7 tenets of existential psychology and relates these to a concept of authenticity which is seen essentially as a condition of being. "To be is to be authentic."—O. Strunk.

7183. Cohen, John; Nuttin, Joseph, & Maslow, Abraham. (U. Manchester, England) **The psychology of man: Today.** *Psychological Scene*, 1968(Sep), Vol. 2, 5-16.

7184. Dreikurs, Rudolf. **The influence of individual psychology on the international scene.** *Individual Psychologist*, 1970(Nov), Vol. 7(2), 29-37.—Describes the current status of individual psychology in various countries throughout the world.—A. R. Howard.

7185. Ellner, Jack R. (New York U.) **A systems analysis approach to the comprehension of human behavior based on an analog-synolog informational theory: An exploratory study.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1382-1383.

7186. Kanizsa, Gaetano. (U. Trieste, Inst. of Psychology, Italy) **Amodale Ergänzung und "Erwartungsfehler" des Gestaltpsychologen.** [Amodal totalization and the "Gestalt-error."] *Psychologische Forschung*, 1970(Sep), Vol. 33(4), 325-344.—"The Gestalt-expectation-error consists in the surprise felt by a Gestalt oriented student of perception when a perceptual phenomenon does not correspond to the expectations raised by a schematic application of Gestalt laws. Some examples of such expectation-errors are presented and discussed. A few remarks on the conditions and the effects of 'amodal' completion phenomena are added."—R. Gunter.

7187. Keeney, Barnaby C. (National Endowment for the Humanities, Washington, D.C.) **The bridge of values.** *Science*, 1970(Jul), Vol. 169(3940), 26-28.—Discusses the relationship between the humanities and the sciences, suggesting that values are a part of the work of both and can provide a bridge between the 2 groups. The present troubled conditions in society and in the environment call for cooperation in strengthening the use of knowledge provided by both scientists and humanists.—P. McMillan.

7188. Kuz'mina, A. I. (Ed.) **Voprosy filosofii i sotsiologii.** [Problems of philosophy and sociology.] Leningrad, USSR: Leningrad U., 1969. 160 p.—Presents a collection of 32 articles, which constitute Issue 1 in this projected series.—I. D. London.

7189. Mair, J. M. (Middlesex Hosp., Medical School, London, England) **The person in psychology and psychotherapy: An introduction.** *British Journal of Medical Psychology*, 1970(Sep), Vol. 43(3), 197-205.—Outlines some differences and similarities between the processes of psychological experimentation and psychotherapy, and suggests how the experimentalist can complement the therapist. (15 ref.)—M. West.

7190. Masserman, Jules H. (Northwestern U., Medical School, Chicago, Ill.) **A planarian behaviorist's view of science and human behavior.** *Journal of Biological Psychology*, 1969(Dec), Vol. 11(2), 10-14.—Develops the thesis that "every man cherishes the same fundamental (Ur) values" which are defined as: (a) basic needs for health, skill, and longevity, or physical, "Ur-defense"; (b) desire for friendships and alliances to ameliorate loneliness and cement communal welfare, or social, "Ur-adaptation"; and (c) search for significance of existence in relation to some cosmic or religious system, or "Ur-seeking for transcendence." These 3

themes are developed contrapuntally by showing that: "the 'physical sciences' too have evolved from naive 'materialism' toward an acceptance of these humanistic values," and "the 'humanities'... can shave their own polyglot and protean concepts down toward more simple and generalized formulae, on the model of the now familiar $E=mc^2$." Based on this Ur-trilogy, some tentative predictions for the future are made.—*M. Maney.*

7191. Pribram, Karl H., Hebb, Donald, & Macdonald, Graham. (Stanford U., Neuropsychology Lab.) **The ghost in the machine.** *Psychological Scene*, 1968(Sep), Vol. 2, 28-43.

7192. Radonjić, Slavoljub. **Operacionalizam i bljeviorizam u psihologiji.** [Operationalism and behaviorism in psychology.] *Psihologija*, 1969(Sep), Vol. 2(2), 383-399.—Hypothesized that operationalism and behaviorism are not inseparably connected. To confirm this hypothesis, 2 analyses were performed. (a) It is shown how operationalist conceptions have changed with time so that they no longer support the traditional behavioristic and neobehavioristic methodological principles, or behaviorism in general. 2 important changes concern changed conceptions in: the place, significance, and function of operational definitions in science; and the introduction of mental and verbal operations. And (b) the manner of operational defining in the practice of behavioristic science is contradicted, e.g., "operations" in behavioristic operational definitions are not all physical, nor metrical. The consequences of the eventual rejection of behavioristic criterium for scientific objective observation on the manner of operational defining, and operational definitions given on the basis of confirmed introspective and phenomenological data are discussed. (26 ref.)—*English summary.*

7193. Rozhin, V. P. (Ed.) **Filosofskie i sotsiologicheskie issledovaniya.** [Philosophical and sociological studies.] Leningrad, USSR: Leningrad U., 1969. 233 p.—Presents a collection of 21 articles which constitute Issue 10 of *Uchenye Zapiski Kafedr Obshchestvennykh Nauk Vuzov Leningrada: Filosofiya* [Scientific Notes of the Social Science Departments of the Leningrad Institutions of Higher Learning: Philosophy].—*I. D. London.*

7194. Wike, Edward L. (U. Kansas) **Secondary reinforcement: Some research and theoretical issues.** *Nebraska Symposium on Motivation*, 1969, Vol. 17, 39-82.—Considers the connections between secondary reinforcement, fractional antedating goal reaction, and frustration from the theoretical viewpoints of Hull, Spence-Amsel, Sheffield, Mowrer, and Skinner. Also considered are the developments in secondary reinforcement research and theory. Several potential research directions are also suggested. The assumption that "stimuli paired with primary reinforcement can become functionally autonomous sources of reward" is believed false by the author. Comments by D. Bindra follow. (105 ref.)—*J. M. Roberts.*

EDUCATION & TRAINING

PROFESSIONAL DEVELOPMENTS

7196. Abramovitz, Arnold & Abramovitz, Carole M. (U. Cape Town, Rondebosch, South Africa) **Psychopathologies: Syndromes of an ailing profession.** *Bulletin of the British Psychological Society*, 1970(Jul), Vol. 23(80), 197-203.—Psychologists as a professional and academic group are seen as engaging in much more self-analysis and self-criticism than their colleagues in other disciplines. Their social perception, sources of anxiety, conflict, and disorganization are examined together with their current methods of dealing with anxiety and conflict. The consequences of these problems are discussed, and recommendations and prognosis are offered.

7197. American Psychological Association, Education Affairs Office. **APA Visiting Scientist Program: 1969-1970.** *American Psychologist*, 1970(Dec), Vol. 25(12), 1105-1108.

7198. American Psychological Association, Educational Affairs Office. **APA Visiting Psychologist Program: 1969-1970.** *American Psychologist*, 1970(Dec), Vol. 25(12), 1109-1112.

7199. Blau, Theodore H. **APA Commission on Accelerating Black Participation in Psychology.** *American Psychologist*, 1970(Dec), Vol. 25(12), 1103-1104.

7200. Buzzard, R. B. & Werr, Patricia A. **Report on replies to the questionnaire on forming a division of occupational psychology and on professional registration.** *Bulletin of the British Psychological Society*, 1970(Jul), Vol. 23(80), 215-217.—Presents a summary of the main results of a questionnaire sent to members of the Occupational Psychology Section of the British Psychological Society concerning professional registration, divisional status and the publication of a professional directory.—*V. S. Sexton.*

7201. Fidell, L. S. (San Fernando Valley State Coll.) **Empirical verification of sex discrimination in hiring practices in psychology.** *American Psychologist*, 1970(Dec), Vol. 25(12), 1094-1098.—1 of 2 survey forms was sent to 228 chairmen of graduate degree-granting university psychology departments in the United States. Each form consisted of 10 paragraphs describing the professional behavior of young psychologists. Respondents rated the desirability of each candidate and indicated at what level the candidate should be offered a position. The forms differed only in that feminine 1st names and pronouns were attached to 4 paragraphs on Form A and a different 4 paragraphs on Form B. 68% of the forms were returned. Women were offered lower levels of appointment than men for 7 of 8 paragraphs and were rated less desirable for 6 of 8 paragraphs.—*Author abstract.*

7202. Walker, Edward L. (U. Michigan, Psychological Lab.) **Relevant psychology is a snark.** *American Psychologist*, 1970(Dec), Vol. 25(12), 1081-1086.—Psychologists may respond to pressing social problems by becoming: (a) an activist, likely to behave in an emotional, antiintellectual and counter-productive manner; (b) a social engineer; and (c) a basic research psychologist who may direct his efforts toward "relevant" social problems and thus avoid trivial research, without becoming too closely tied to immediate applied problems. Basic, and possibly fatal, flaws in our present governmental procedures and practices are pointed out,

and suggestions are made of directions of improvement.
—Author abstract.

INTERNATIONAL PSYCHOLOGY

7203. ———. **Proyecto de recomendaciones sobre la creación, la distribución y el empleo de tests psicológicos.** [Project to make recommendations on the creation, distribution and use of psychological tests.] *Revista de Psicología General y Aplicada*, 1970(Jan), Vol. 25(102), 109-111.—The International Association of Applied Psychology (AIPA) wants to protect the general public from the use of invalid tests, their interpretation by incompetent people, and their abusive use psychodagnostically. Accordingly, the AIPA recommends that national associations in each country set up a test commission charged with improving the quality of psychological tests presenting their abuse and coordinating research studies on tests with those from other countries. This project will be presented to the General Assembly of the AIPA in Liege, 1971.—D. H. Schuster.

7204. Dunn, S. S. (Monash U., Clayton, Victoria, Australia) **Qualifications of test users.** *Australian Psychologist*, 1968(Nov), Vol. 3(2), 76-80.—Discusses qualifications of test users in Australia, including educators, other professionals, and personnel officers in regard to the principles of professional conduct set out in the Code of Ethics of the Australian Psychological Society. The 1st 2 are seen as highly relevant: (a) the welfare of clients, students, research Ss, and the public must take precedence over the demands of one's employer, professional colleagues, or self interest; and (b) the welfare of the profession must be protected, and members, when acting in their professional capacity, are expected to ensure this. Because of test differences with respect to conditions for administration, and complexity and context of interpretation, judgment of user qualifications should not be based on the occupation of the applicant, but on his training and the test situation. Problems are discussed related to user qualifications within the framework of the 3 levels of Educational and Psychological Tests and Manuals used by the American Psychological Association, American Educational Research Association, and the National Council of Measurement in Education, serving as the basis of Australian Council for Educational Research policy.—T. N. Webster.

7205. Fox, Richard G. (U. Melbourne, Victoria, Australia) **Legal aspects of confidentiality.** *Australian Psychologist*, 1968(Nov), Vol. 3(2), 53-75.—Examines questions involving Australian psychologists and their clients concerning when a psychologist can legally be obliged to, or restrained from, divulging confidential information. The impact of professional ethics (as outlined in the April 1968 Code of Professional Conduct of the Australian Psychological Society), and other extralegal pressures on the principle of confidentiality are also explored. Australian law is seen as uncertain and poorly defined regarding disclosure of confidential information out of court and in court, i.e., professional privilege. In deciding "whether to divulge confidential information, the psychologist must not only consider the ethical standards of his profession and the demands of civil and criminal law," but also the standards of good citizenship which may "appear to clash with his strict ethical and legal obligations." It is suggested that each psychologist must balance these conflicting interests and

determine for himself which is to be given priority. Future possibilities of the law, acknowledging the psychologist's ethical principle of confidentiality by recognizing a claim for psychologist-client privilege, are discussed. (15 ref.)—T. N. Webster.

7206. Owens, A. G. **Salaried psychologists in full time employment undertaking part-time practice for a fee.** *Australian Psychologist*, 1968(Nov), Vol. 3(2), 81-88.—Presents views of the Committee on Ethical and Professional Standards of the Australian Psychological Society, including the committee's primary considerations that (a) the public must be protected from improper or substandard practice, and (b) the welfare and integrity of the profession must be ensured. Discusses arguments relating to public interest and the profession as a whole in terms of (a) professional competence; (b) rights of the client (including full-time employers) as affected by availability of qualified private practitioners; (c) the effect of part-time practitioners on the earnings of full-time practitioners; (d) differences in benefit to the profession of part-time work during the developmental, intermediate, and established stages of the profession; (e) unfair practices, i.e., fee undercutting and soliciting the clients of competitors; and (f) existing regulations of larger employing organizations concerning part-time work by their employees.—T. N. Webster.

GENERAL BOOKS & REFERENCE WORKS

7207. ———. **Nomina de instituciones con las que se mantiene intercambio.** [A list of institutions with which an exchange exists.] Montevideo, Uruguay: U. del Trabajo del Uruguay, 1969. v, 92 p.

7208. Itel'son, L. B. **Lektsii po obshchei psikhologii.** [Lectures on general psychology.] Vladimir, USSR: State Pedagogical Inst., 1970. 268 p.—Presents 12 lectures on the subject matter and methods of psychology, behavior, activity, the genesis of consciousness, and the functional and anatomophysiological mechanisms of the psyche. These lectures constitute the 1st part of the course.—I. D. London.

METHODOLOGY & RESEARCH TECHNOLOGY

7209. Blauberg, I. V., et al. (Eds.) **Problemy metodologii sistemnogo issledovaniya.** [Problems in the methodology of systems research.] Moscow, USSR: Mysl', 1970. 456 p.—Presents a collection of 17 articles on the systems approach in contemporary science, particularly in biology and cybernetics. Articles on the theory of complex systems and on the systems approach to the modeling of thought processes are included.—I. D. London.

7210. Mair, J. M. (Middlesex Hosp. Medical School, London, England) **Experimenting with individuals.** *British Journal of Medical Psychology*, 1970(Sep), Vol. 43(3), 245-256.—Argues that psychologists might profitably focus more attention on the study of individuals. A number of features of individuals which fit uneasily into the present physical science model of psychological investigation are outlined, and their implications considered. In addition to changes in methods made necessary by a more central concern with

individual experience and action, changes in aims in psychology may also be needed. An alternative framework for general psychological inquiry is outlined. This alternative, termed a conversational model, accommodates these changed aims and overcomes various problems noted in traditional modes of experimentation. Within this approach it is clearly necessary to experiment with rather than on individuals.—*Journal summary.*

7211. Marks, Edmond. (Pennsylvania State U.) **Some results relating to the choice of an experimental unit in multivariate research.** *Multivariate Behavioral Research*, 1970(Oct), Vol. 5(4), 507-520.—Discusses several analytic expressions in terms of differences which are to be expected between results obtained from applying the same multivariate analysis to data based on different experimental units. The 2 units considered are the individual observation and the group as a unit, i.e., some function, typically the mean, of the individual observations within a group. It is demonstrated that certain statistical properties of the class of design matrices where this choice of units arises lead to substantial differences in the results and interpretations of multivariate analyses. This development provides a partial mathematical account for such observed differences as are frequently encountered in practice.—*Journal abstract.*

7212. Schroeder, Stephen R. (U. North Carolina) **Usage of stereotypy as a descriptive term.** *Psychological Record*, 1970(Sum), Vol. 20(3), 337-342.—Indicates in a brief review of the literature in psychology that the term "stereotypy" has many usages and contexts. A scheme is suggested to reduce confusion between stereotypy and related terms. (26 ref.)—*Journal abstract.*

7213. Sodeur, Wolfgang. (U. Cologne, Inst. of Sociology, W. Germany) **Specialized data archives as instruments of theory testing: With examples drawn from small-group leadership studies.** *Social Science Information*, 1969(Oct), Vol. 8(5), 119-125.—Discusses problems of the use of accumulated research data, using the area of "leadership" as an example, in order to (a) make comparable the results of different studies, (b) integrate knowledge and construct complex theories, and (c) provide a means for testing such theories. Studies of leadership are cited as illustrations and constitute "a multidimensional model, where numerous conditioners and several leadership components either additively or interactionally influence the satisfaction of followers." To provide a more accurate analysis of such a model, it is suggested that specialized data archives be developed which would anticipate future requirements by including a wider set of potentially relevant variables. It is also suggested that future retrieval systems should be equipped to permit secondary analysis on sets of variables rather than on single variables. (16 ref.)—*P. McMillan.*

MODELS & MATHEMATICAL MODELS

7214. Brudnyi, A. A. (Ed.) **Problema model v filosofii i estestvoznani.** [The problem of the model in philosophy and natural science.] Frunze, USSR: Ilim, 1969 91 p.—Presents a collection of 5 articles, concerning the methodological problems in bionics and information theory, and the modeling of the interconnection between language and thought. 1 article deals with the "reliability of psycholinguistic modeling of semantics."—*I. D. London.*

7215. Wagschal, Peter H. (U. Massachusetts, School of Education) **Psychology and model-building: The orienting response.** *Journal of Biological Psychology*, 1969(Sep), Vol. 11(1), 25-31.—Reviews research on the orienting response as an illustrative example of the "unimaginative model building that cripples psychology," and "of the possibilities inherent in imaginative model building." Brief indications of the kinds of research that have been and are being done to investigate the usefulness of the computer-cognitive-man model and suggestions for further extending the model are included as examples of possible lines for research. It is concluded that without "some model of cognitive processes that dares to suggest underlying mechanisms and is abstract enough to be applicable to a wide range of psychological processes, research is doomed to be stultifyingly unproductive and non-cumulative."—*M. Maney.*

MATHEMATICS & STATISTICS

7216. Artem'eva, E. Yu. **Sbornik zadach po teorii veroyatnostei i matematicheskoi statistike dlya psikhologov.** [Collection of problems in probability theory and mathematical statistics.] Moscow, USSR: Moscow U., 1969. 92 p.—Contains 163 problems for use in the course on the "application of mathematical methods in psychology," given at the Moscow State University.—*I. D. London.*

7217. Delvaux, Jean P. (U. Lovanium, Lab. of Psychometry, Kinshasa, Congo) **Calcul simplifié de la corrélation entre deux variables: Estimation rapide du coefficient de corrélation de Bravais-Pearson à partir d'un test de contingence entre deux séries de données paires.** [Simplified calculation of the correlation between two variables: Rapid estimation of Bravais-Pearson correlation coefficients in reference to a test of contingency between two series of given pairs.] *Revue de Psychologie et de Sciences de l'Education*, 1970, Vol. 5(3), 302-308.—Presents a method particularly easy to handle in determining the degree of statistical dependence of 2 variables. This procedure is suitable to any kind of distribution the investigator may be confronted with, and especially to item analysis performed on a restricted number of data ($N < 400$). Spitz' logarithmic test is applied to data distributed over a contingency table. The χ^2 test is then transformed into coefficient of contingency which after correction for grouping error, is equivalent to Bravais-Pearson r . (Dutch summary)—*English summary.*

7218. Games, Paul A. (Pennsylvania State U.) **Inverse relation between the risks of Type I and Type II errors and suggestions for the unequal n case in multiple comparisons.** *Psychological Bulletin*, 1971(Feb), Vol. 75(2), 97-102.—Criticizes L. Petrinovitch and C. D. Hardyck's (see PA, Vol. 43:7531) recommendations. It is shown that for 2 mean contrasts, the techniques they studied are applications of the same statistic; only different critical values for significance and/or the use of sequential procedures distinguish the tests. Their results mainly reflect the usual relationship that a conservative criterion that protects against a Type I error has a larger risk of Type II error than a less conservative criterion. Petrinovitch and Hardyck's recommendation of the usage of only the Scheffé test and Tukey Wholly Significant Difference test is only an arbitrary preference for conservative tests. Their conclusions on the effects of unequal variances and unequal

ns are disputed; an alternative technique for the unequal n case is proposed. (21 ref.)—*Journal abstract.*

7219. Lunney, Gerald H. (Long Island U., C. W. Post Center) **Using analysis of variance with a dichotomous dependent variable: An empirical study.** *Journal of Educational Measurement*, 1970(Win), Vol. 7(4), 263-269.—Determined if analysis of variance techniques are appropriate when the dependent variable has a dichotomous 0-1 distribution. Several 1-, 2-, and 3-way analysis of variance configurations were investigated with regard to both the size of the Type I error and the power. Findings show the analysis of variance to be an appropriate statistical technique for analyzing dichotomous data in fixed effects models where cell frequencies are equal under the following conditions: (a) the proportion of responses in the smaller response category is equal to or greater than .2 and there are at least 20° of freedom for error, or (b) the proportion of responses in the smaller response category is less than .2 and there are at least 40° of freedom for error.—*Journal abstract.*

7220. Parker, S. R. (Government Social Survey Dept., London, England) **Correlational analysis of data obtained from a survey of shop stewards.** *Human Relations*, 1970(Aug), Vol. 23(4), 345-359.—Compared the relative advantages of the McQuitty elementary linkage analysis with factor analysis and principal component analysis. The 3 forms of correlational analysis were applied to data from 994 shop stewards. 3 variables were established: militancy, activism, and satisfaction. Factor analysis gave the most satisfactory explanation of the relationships between variables, but the McQuitty technique was useful in imposing a preliminary structure to reduce the number of variables in the analysis. Principal component analysis confirmed the existence of the attitude dimension revealed by factor analysis. Usefulness of combining these techniques is discussed.—*W. W. Meissner.*

7221. Schönemann, Peter H. (Purdue U.) **A note on Gulliksen's least squares solution for incomplete data.** *British Journal of Mathematical & Statistical Psychology*, 1970(May), Vol. 23(1), 69-71.—Gives a sufficient condition that scale values obtained with H. Gulliksen's (see PA, Vol. 31:4030) incomplete data solution is unique up to an additive constant.—*Journal abstract.*

7222. Yang, Kuo-shu. **Suppressor variables revisited.** *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 68-79.—Proposes a scheme for classifying suppressor variables, within which mathematical models are described and statistical conditions derived for distinguishing among several kinds of suppressors. General criticisms are made with respect to the inadequacies of the previous use of the suppression technique. (23 ref.)—*Journal abstract.*

Factor Analysis

7223. Horst, Paul. (U. Washington) **Generalized factor analysis: I. Rationale.** Seattle, Wash.: U. Washington, 1969. 88 p.

7224. Schneewind, Klaus A. & Cattell, Raymond B. (Psychological Inst. of the University, Erlangen, W. Germany) **Zum Problem der Faktoridentifikation: Verteilungen und Vertrauensintervalle von Kongruenzkoeffizienten für Persönlichkeitsfaktoren im Bereich objektiv-analytischer Tests.** [A contribution

to the problem of factor identification: Distribution and confidence intervals of congruence coefficients for personality factors as far as objective-analytical tests are concerned.] *Psychologische Beiträge*, 1970, Vol. 12(2), 214-226.—On the basis of 10 factor-analytical investigations (objective-analytical tests) distributions and confidence limits of factor congruence coefficients were determined. The confidence intervals were calculated for 5 overlapping levels and for 5 different significance levels. Obviously there is a difference between empirical congruence coefficients and the corresponding theoretical correlation distributions. In factor analytical replication investigations the confidence intervals of congruence coefficients represent a good basis for factor identification. (32 ref.)—*English abstract.*

COMPUTERS & PROGRAMING

7225. Amosov, N. M. **Iakusstvennyi razum.** [Artificial intelligence.] Kiev, USSR: Naukova Dumka, 1969. 156 p.—Discusses the hypothetical principles in support of the concept of an artificial brain, and the cybernetic creation of artificial intelligence.—*I. D. London.*

7226. Apter, Michael. (University Coll. of South Wales, Cardiff, England) **The computer simulation of behaviour.** London, England: Hutchison U. Library, 1970. 180 p. £1.75(cloth), £.75(paper).

biological systems.] Moscow, USSR: Nauka, 1969. 316 p. Moscow, USSR: Nauka, 1969. 316 p.—Republishes the major works of Mikhail L'vovich Tsetlin (1924-1966), known for his contributions to the field of cybernetics.—I. D. London.

TESTING

7231. Abidin, Richard R. (U. Virginia) **KTSA interscorer reliability for children's protocols.** *International Journal of Symbolology*, 1970(Apr), Vol. 1(3), 37-39.—Compared the Kahn Test of Symbol Arrangement interjudge agreement between scores at 4 different levels of training. Using the 9 scoring categories, correlations and % agreement were obtained for the overall number element, and for the scoring on the symbolization, like and dislike, and reason for arrangement portions of the test. Correlations ranged from a high of .96 for the N E scores to a low of .45 between 1 pair of raters. Percentage agreement figures ranged from 87-67%.—*Journal abstract.*

7232. Doll, Richard E. (U.S. Naval Aerospace Medical Inst., Pensacola, Fla.) **Item susceptibility to attempted faking as related to item characteristic and adopted fake set.** *Journal of Psychology*, 1971(Jan), Vol. 77(1), 9-16.—Certain research indicates that faking in real life consists more of a subtle slanting of responses than 1 of uninhibited dissimulation which is the fake set more commonly used in research addressed to the problem of faking. Item susceptibility to attempted faking is investigated as related to 2 item characteristics: objective vs. subjective and continuous vs. noncontinuous. 300 Aviation Officer Candidates served as Ss. 2 subtle fake sets and 1 unsubtle fake set were used. Findings demonstrate certain differences in the kinds of items that are susceptible to attempted faking as a function of differences in adopted fake sets. (17 ref.)—*Journal summary.*

7233. Gardner, P. L. (Monash U., Clayton, Victoria, Australia) **Test length and the standard error of measurement.** *Journal of Educational Measurement*, 1970(Win), Vol. 7(4), 271-273.—Shows how relationships may be derived from the defining formulas of reliability and standard error of measurement, if certain simple assumptions about values of test statistics are made. F. M. Lord has shown empirically that the standard error of a test was equal to $.43\sqrt{n}$ if the reliability of the test was computed by the Kuder-Richardson (KR) 20 formula. If the KR-21 formula was used, the standard error was equal to $.48\sqrt{n}$.—*Journal abstract.*

7234. Hogan, Thomas P. (Harcourt Brace Jovanovich Inc., New York, N.Y.) **Using old socioeconomic data for defining norm groups.** *Journal of Educational Measurement*, 1970(Win), Vol. 7(4), 229-232.—Obtained correlations between 1950 and 1960 census data for 3 socioeconomic variables for a sample of 200 communities. The socioeconomic data for 1950 and 1960 correlated approximately .90, indicating a high degree of relative stability. It is concluded that old socioeconomic data are useful for defining norm samples.—*Journal abstract.*

7235. Kelly, William L. (Georgetown U.) **Normative data on the Group-KTSA.** *International Journal of Symbolology*, 1970(Apr), Vol. 1(3), 41-50.—Presents means, standard deviations, t statistics, and the symbol pattern for 4 groups of undergraduates and 2 groups of black high school students participating in a college

orientation program. Consistency of symbol patterns over groups, consistency of retest behavior with 1 group, and sex differences warrant further research with the Group Kahn Test of Symbol Arrangement as a quantitative assessment instrument of symbolic behavior.—*Journal abstract.*

7236. Ramey, Madelaine M. (U. California, Berkeley) **Two probability models for multiple choice ability tests.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 901.

7237. Ramsey, H. Rudy. **The semiautomated test system: A tool for standardized performance testing.** *USN AMI Army-Navy Joint Report*, 1969(Nov), No. 1092, 14 p.—Developed a Semiautomated Test System (SATS), incorporating programable digital logic modules for control, to allow an experimental psychologist, unassisted and with a minimum of special training, to set up and modify tests or experiments. The structure of the SATS is described and an example is presented to clarify the operations involved in its use.—*Journal abstract.*

7238. Shoemaker, David M. (Southwest Regional Lab. for Educational Research & Development, Inglewood, Calif.) **Item-examinee sampling procedures and associated standard errors in estimating test parameters.** *Journal of Educational Measurement*, 1970(Win), Vol. 7(4), 255-262.—Estimated selected parameters for a negatively skewed and a normally distributed normative distribution in a post mortem item-examinee sampling investigation. Manipulated systematically were number of subtests, number of items/subtest, and number of examinees responding to each subtest. Each item-examinee sampling procedure was replicated 5 times. Defining 1 observation as the score received by 1 examinee on 1 item, the results of this investigation support the conclusion that, in estimating parameters by item-examinee sampling, the variable of importance is not the item-examinee sampling procedure, but is instead the number of observations obtained by that procedure. Degree of skewness in the normative distribution and failure to distribute all items among subtests were found to be relatively unimportant variables.—*Journal abstract.*

7239. Terry, Roger L. & Isaacson, Randall. (Hanover Coll.) **Item failure and performance on subsequent items of an achievement test.** *Journal of Psychology*, 1971(Jan), Vol. 77(1), 29-32.—Tested the hypotheses (a) that failure of a test item increases test anxiety which in turn leads to error perseveration, and (b) that the detrimental effects of failure are greater for highly anxious students generated confirming results. 31 undergraduates served as Ss. 16 Ss received at random Form A of an 80-item multiple choice exam, and 15 Ss received Form B. Ss, especially more anxious ones, were more likely to miss a test item when it immediately followed an inevitably failed question than when it preceded that question.—*Author abstract.*

Construction & Validation

7240. Allegro, J. T., Bagchus, P. M., & Hofstee, W. K. **Konstruktie van een gedwongen keuze-leiderschapsschaal (LOS).** [Construction of a forced-choice leadership attitude scale (LOS).] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Jul), Vol. 25(7), 451-463.—A forced-choice leadership scale was developed to avoid the ceiling effect found in the customary Likert-type scales. Earlier American and

Dutch studies of leadership identified the factors of original consideration (SE), initiating structure (I), and individual prominence (IP). 18 pairs of items were constructed for each of the paired factors, a total of 108 test items. Ss were 171 noncommissioned officers. The paired items were factor analyzed by the principal axes and varimax rotation methods. The factor analysis did not yield any results that could be interpreted. Criteria rotation yielded 2 factors capable of interpretation. Factor I was characterized by items identified by SE paired with T or IP, interpreted as "soft" or "hard" leadership. Factor II consisted of T items paired with IP items. The scale incorporating Factor I has a retest r of .75. The scale incorporating Factor II was rejected because of the low r . It is concluded that the use of the forced-choice technique does not reveal the factor pattern as clearly as would have been found by the use of the Likert-type scales. (English abstract) (16 ref.)—A. J. Ter Keurst.

7241. Hanna, Gerald S. & Roscoe, John T. (Kansas State U.) **Comparing validity of chance level and higher test scores.** *California Journal of Educational Research*, 1970(May), Vol. 21(3), 127-131.—Presents a technique for quantifying and comparing the validity of scores of different levels and employs it to investigate the relationship between multiple-choice and completion geometry test scores. An 18-item, 22-min geometry completion test was given in 11 high schools. A parallel 4-option, multiple-choice test was given. All tests were scored for the number right. The regression equation based on the total group was used to estimate each S's completion score from his multiple-choice score. Chance level multiple-choice scores appeared to be at least as valid as higher level scores in estimating completion scores by means of the total group regression equations. Findings are consistent with earlier evidence that chance level scores possess validity.—H. J. McWhinnie.

7242. Jones, Marshall B. (Pennsylvania State U., Hershey) **Heritability as a criterion in the construction of psychological tests.** *Psychological Bulletin*, 1971(Feb), Vol. 75(2), 92-96.—Many psychologists now and in the past have argued for the heritability of intelligence and many other test variations. However, no psychological test has been constructed using heritability as a criterion and twins as Ss. A twin method for maximizing heritability in the construction of a psychological test is described and illustrated. The heritability criterion in relation to other criteria, and the range of test situations in which the twin method may be used appropriately are discussed.—*Journal abstract*.

7244. Wofford, J. C. & Willoughby, T. L. (U. Texas, Arlington) **The effects of test construction variables upon test reliability and validity.** *California Journal of Educational Research*, 1969(May), Vol. 20(3), 96-106.—Investigated factors critical in test construction and evaluation such as: item difficulty, test length, size of upper and lower criterion groups, item selection, and confidence levels. 200 undergraduates completed a 150-item questionnaire regarding their study habits. This provided the data for a variety of item analyses. Results indicate that: (a) the difficulty levels obtained by the use of the 27% extreme group size correlates with those obtained by the use of the total group; (b) difficulty

levels and test lengths did not significantly influence the concurrent validity; and (c) item-total score analysis provided tests of higher internal consistency than did item-discrimination analysis.—H. J. McWhinnie.

EXPERIMENTATION & OBSERVATION

7245. Evans, Glen T. (Ontario Inst. for Studies in Education, Toronto, Canada) **Application of a model of categorizing behavior.** *Multivariate Behavioral Research*, 1970(Oct), Vol. 5(4), 489-505.—Proposes a model for latent partition analysis and describes 2 applications to data arising from sorting tasks. The model is based on a possible strategy which Ss might use in sorting a large number of stimuli. The 1st application is concerned with a judgmental classification of semantic differential scales in contrast to the usual type of analysis based on responding with the scales to a particular concepts. A study with 800 6th-10th graders is described. The 2nd application is concerned with the classification by 71 undergraduates of a selection of student behaviors.—*Journal abstract*.

7246. King, David J. (State University Coll. New York, Oswego) **The subject pool.** *American Psychologist*, 1970(Dec), Vol. 25(12), 1179-1181.—Examines the participation of college students as Ss in experiments, and discusses the value of a voluntary system. Under this specific set of procedures, few students requested not to serve as Ss. Those serving had a positive attitude which was strongly related to whether or not an explanation of the study had been presented.—*Author abstract*.

7247. Lumpkin, Martin. (Texas Tech U.) **Walden I and II: A plea for renewed balance in the psychological pursuit of science.** *American Psychologist*, 1970(Dec), Vol. 25(12), 1087-1090.—Using the symbols Walden I (Thoreau) and Walden II (Skinner), the 2 poles of the scientific process—uncontrolled observation and controlled evaluation of events—are discussed. These separate-and-united poles are both necessary to the pursuit of psychological science, despite the danger of imbalance in current insistence on methodological priority. This neglect of the place of uncontrolled naturalistic observation has several dangers: the transformation of psychological science into a frozen technology and the neglect of the practitioners' unique scientific position for free and unrestrained observation. A plea is made to renew the balance of this science by recognizing the value of uncontrolled observation in relation to controlled experimental evaluation.—*Author abstract*.

7248. Rabbot, B. S. **Éksperimental'nye metody v sotsial'nom poznanii.** [Experimental methods in social knowledge.] *Voprosy Filosofii*, 1970, Vol. 24(3), 40-49.—Discusses the implications of experimentation in the social sciences which make it so different from that in the natural sciences. Man is deeply involved in this experimentation and for this reason becomes deeply engaged in its application and responsible for its consequences. Objectivity, hence, takes on a meaning for the social sciences different from that accepted in the physical sciences.—I. D. London.

7249. Rubin, Zick & Moore, James C. (Harvard U.) **Assessment of subjects' suspicions.** *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 163-170.—Assessed 142 male undergraduates, suspicions about a deceptive experiment by means of both an open-ended questionnaire and an intensive individual

interview, which lasted about 2 hr. $\frac{1}{2}$ of the Ss reported their recollections of the experimental procedures, and $\frac{1}{2}$ reported their impressions. The latter instructions provided a somewhat better approximation to the criterion measure of suspicion derived from detailed coding of the tape-recorded interviews. The extent of a S's suspicion was directly related to his self-esteem, the extent of his training in psychology, and his resistance to influence in the experiment. Also, the behavior of highly suspicious Ss was found to be related to their level of authoritarianism. Suspicious Ss with high scores on the California F scale tended to yield to the demand characteristics of the experiment, while suspicious Ss with low scores on the F scale were more likely to react against the perceived demands, (28 ref.)—*Journal abstract*.

7250. Vandament, William E., Burright, Richard G., Fessenden, Rollin R., & Barker, William H. (State U. New York, Binghamton) **Tables of event sequences for sequential analyses of data in psychological experiments containing two-class events.** *Behavior Research Methods & Instrumentation*, 1970(Nov), Vol. 2(6), 290-296.—Presents tables of sequences of 2-class events for use in programming psychological experiments in which behavior on trial n may be a function of the events of trials $n-1$, $n-2$, and/or $n-3$. Various factors related to schedule generation are discussed, e.g., restrictions on trial-block length which accompany sequential balance, interrelationships of trial blocks in the multiblock experiment, relationships between run length and r -tuple occurrences, and alternation behavior. Following a consideration of various methods of schedule generation for the 2-class experiment, it is concluded that no method can result in schedules that possess all properties considered desirable in psychological experiments. However, the present sequences allow for sequential balance and analysis, and thus should prove useful in producing schedules in some contexts that are standard regarding sequential influences.—*Journal abstract*.

APPARATUS

7251. Brůšek, Jan. **Automatický blikáč.** [An automatic flasher.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(2), 171-177.

7252. Delbarre, B., Dumas, G., & Guionniere, M. (Pfizer-Clin Lab., Amboise, France) **An automated open field method.** *Psychopharmacologia*, 1970, Vol. 18(2), 227-230.—A new automated apparatus for recording movement and rearing of rats in the open-field method was produced using electronic techniques. The equipment permits the evaluation of depressant and excitatory actions of drugs on the CNS.—*Journal abstract*.

D. London.

EXPERIMENTAL PSYCHOLOGY

7260. Ayoub, M. A., Ayoub, M. M., & Ramsey, J. D. (Texas Tech U.) **A stereometric system for measuring human motion.** *Human Factors*, 1970(Dec), Vol. 12(6), 523-535.

7261. Teghtsoonian, Robert. (Smith Coll.) **On the exponents in Stevens' law and the constant in Ekman's law.** *Psychological Review*, 1971(Jan), Vol. 78(1), 71-80.—It follows from S. S. Stevens' psychophysical power law, $\psi = \alpha\phi^n$, that the exponent $n = \log$

$R_s/\log R_s$ where R_s is the ratio of the greatest to the least stimulus intensity and R_r is the ratio of corresponding sensory magnitudes. Data from 21 experiments by Stevens show a correlation (Pearson r) of $-.935$ between $\log R_s$ and $1/n$, implying that $\log R_s$ is nearly constant. On this basis it is proposed that a single scale of sensory magnitude serves a wide variety of perceptual continua, and that variation in power law exponents is primarily due to variation in dynamic ranges. The hypothesis that there is just 1 scale of sensory magnitude suggests that there may be just 1 value for subjective resolving power. When Weber fractions are transformed to their subjective counterparts by the psychophysical power law, the result for 9 different continua is nearly constant at about .03. (38 ref.)—*Journal abstract*.

7262. Wittersheim, Gérard. (Bioclimatic Study Center, Strasbourg, France) **Le concept d'incertitude en psychologie.** [The concept of uncertainty in psychology.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(1-3), 44-49.—Reviews studies in experimental psychology on the relation between degree of uncertainty and certain variables of behavior. Only in recent years has progress been made in the problem of complex decision making, involving a multitude of variables in analysis of a situation: C. E. Shannon and W. Keable's development of their information theory as applied to telecommunications; and K. E. Hick's completion of J. Merkel's studies by new experiments leading to establishment of the Hick ratio. The basic concepts of the information theory are presented, along with a discussion of the Hick ratio, Shannon ratio, uncertainty in detection (search), begun with radar operators during World War II and continuing in research with the Tanner-Swets model. The information theory and the statistical theory of detection are now developing into a unit theory; the decision theory, based on more dynamic models with still more abstract structures, may be irksome for nonmathematician psychologists, but can be an important aid in reducing their own uncertainty as to how man thinks, reasons, decides, and acts. (19 ref.)—*T. N. Webster*.

PERCEPTION

7263. Baumstiler, Y. **Peut-on parler de décision dans la perception?** [How one regards decision in perception.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(1-3), 56-62.—Examines the threshold concept (as understood in psychology and psychophysics), discussing several models of the threshold theory, among them the Tanner-Swets statistical decision-making theory of visual detection, which enables the resolution of certain criticisms of, and the integration of certain phenomena lacking in the threshold theory itself, notably the idea that the S actively intervenes in perception by establishing a criterion which is a function of the utility attached to different issues. 2 major objections to the Tanner-Swets theory are the impossibility of considering a response as independent of the response preceding it, and the difficulty in determining whether or not it is possible to attach a utility to each issue.—*T. N. Webster*.

7264. Huang, Shu-Jen. (National Taiwan U., Taipei) **A historical review of perceptual defense.** *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 53-61.—Traces the history of perceptual defense back to perception and sensation. More than 300 articles have appeared in the literature since the formulation of the concept of perceptual defense. The change of interest in

the investigation has shifted from the dynamic aspect to perceptual behavior and emphasizes the role of individual differences in personality. Other trends of verbal behavioristic interest have concentrated on the problem of word frequency and response bias. In view of the amount of experimentation conducted, the advance of perceptual defense is impressive and the concept remains an intellectual challenge to the field of verbal learning. (29 ref.)—*Journal abstract*.

7265. Järvinen, J. (Ed.) **Contemporary research in psychology of perception.** Porvoo, Finland: WSOY, 1969. 212 p. 45 MK.

7266. Teghtsoonian, Robert & Teghtsoonian, Martha. (Smith Coll.) **Two varieties of perceived length.** *Perception & Psychophysics*, 1970(Dec), Vol. 8(6), 389-392.—Describes 3 experiments with 46 female undergraduates investigating the effect of the mode of stimulation on the perception of length. Results indicate that when Ss judged the apparent lengths of blocks presented either visually or proprioceptively (between thumb and finger of 1 hand), visual length was proportional to block length, whereas proprioceptive length was an accelerating function of block length. When both visual and proprioceptive stimulation occurred simultaneously (Ss both saw and felt a block), the visual input was preemptive. (23 ref.)—*Journal abstract*.

7267. von Wright, J. M. (U. Turku, Finland) **A cross-modal effect in the retention of velocity.** In J. Järvinen (Ed.), "Contemporary research in psychology of perception." (See PA, Vol. 45:Issue 5) 203-207.—Reports results showing that the reproduction from memory of the velocity of visually and of kinesthetically perceived movement is significantly influenced by interpolated movement-stimulation in either modality as well as by interpolated tactually perceived movement. For visual velocity the intramodal effects were greater than the cross-modal ones.—*Author abstract*.

Illusion

7268. Bergman, Lasse. (U. Stockholm, Psychological Lab., Sweden) **On Usnadze's volume illusion.** *Psychologische Forschung*, 1970(Sep), Vol. 33(4), 310-324.—"Contrary to what was expected, Ss overestimated the volume in heavier objects, when making estimations with no visual cues available (a 'positive volume illusion'). This finding contradicts the result of Usnadze. He found that the heavier of 2 spheres equal in volume was perceived as the smaller by most Ss with their eyes closed. The stimuli used were spheres and cylinders of different weights and volumes. In 4 experiments the Ss reported their volume ratings with the help of 2 direct scaling methods, magnitude estimation or ratio estimation. Lifting stimuli with 1 sphere in each hand gave, as a result, a difference between hands. This difference was interpreted to imply that the Ss did not just follow a strategy to give higher volume estimates to heavier objects. The positive volume illusion phenomenon that appeared in all 4 experiments was affected by such sources of variation as time (trial number), and size-weight interaction, defined as a stimulus context variable. Neither a strategy which assumes that the Ss judge density instead of volume, nor any other size-weight interaction model is effective in explaining the volume illusion. The search for such a model was suggested as a line for future research."—*R. Gunter*.

7269. de Vicente, María L. **El efecto de la auto-**

corrección en la ilusión de Müller-Lyer. [The effect of self-correction in the Müller-Lyer illusion.] *Revista Interamericana de Psicología*, 1970(Mar), Vol. 4(1), 1-11.—Examined the effects of error reporting on practice effects. Each of 28 male and female psychology undergraduates was exposed to the following conditions: (a) blindfolded and asked to draw a 3-in line 25 times, without error feedback on line estimation; (b) 7 days later blindfolded and asked to draw a 3-in line 25 times with line error estimation reported verbally after each trial. Results indicate all Ss did better when errors were reported after each trial than when errors were not reported at all. Data were analyzed with the *t* test and found to be statistically significant at the .01 level of confidence with 7 degrees of freedom. Results also support Thorndike's laws of use and effect. (English & Portuguese summaries)—*H. Lohn*.

7270. Fisher, Gerald H. (U. Newcastle upon Tyne, England) **An experimental and theoretical appraisal of the perspective and size-constancy theories of illusions.** *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 631-652.—Asserts that the perspective and size-constancy theories of illusions imply that illusory distortions arise as a consequence of mistaken perceptual impressions of depth. Predictions from these theories are tested in 6 experiments and several ancillary studies. They show that although differences in apparent distance may be sufficient for the appearance of illusions their presence is not a necessary condition. Detailed theoretical implications of results are discussed. (36 ref.)—*Journal abstract*.

7271. Fulgosi, Ante. **Stereoskopsko inspitivanje geometrijskih optičkih iluzija u tački superpozicije stereograma.** [Stereoscopic investigation of geometrical optical illusions by superimposed stereograms.] *Psihologija*, 1969(Sep), Vol. 2(2), 432-435.—Classified all geometrical optical illusions on the basis of phenomenological appearance as illusions of size or as illusions of line deformities or displacement. It was hypothesized that each group of illusions was based on a different bodily mechanism: illusions of size being provoked by central factors, illusions of line deformities or displacement being produced by dynamic interactions in the retina. 5 illusions of size and 5 illusions of deformities or displacement were presented to 21 Ss in ordinary and stereoscopic viewing. Results confirm the hypothesis. All illusions of size were present in stereoscopic viewing, but all illusions of deformities or displacement disappeared. Factors of retinal rivalry and suppression were controlled.—*English summary*.

7272. Kolehmainen, Kyösti & Cronhjort, Ritva. (U. Turku, Inst. of Psychology, Finland) **Apparent properties of inspection figures as determiners of figural after-effects.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(2), 103-108.—Studied figural aftereffects (FAE) using the Hering, the Ehrenstein, and the Orbisson illusion patterns in 2 ways. 106 undergraduates served as Ss. In 1 condition, the total pattern was used as inspection figure (IF), and that part of the pattern in which the illusion normally appears, as test figure (TF). The resulting FAE was in a direction opposite to that of the illusion. In the 2nd condition, the illusion producing part of the total pattern served as IF, and the illusion suffering part as TF. This produced an aftereffect, the direction of which was the same as that of the illusion. (28 ref.)—*Journal abstract*.

7273. Pressey, A. W. (U. Manitoba, Winnipeg,

Canada) **The assimilation theory applied to a modification of the Müller-Lyer illusion.** *Perception & Psychophysics*, 1970(Dec), Vol. 8(6), 411-412.—Applied the assimilation theory of illusions, which utilizes the principle that large magnitudes in a series are underestimated and small magnitudes are overestimated, to a modification of the Müller-Lyer illusion. A close link was shown to exist between the Müller-Lyer illusion, a modification of the Müller-Lyer illusion, and the Sander parallelogram. A new illusory target is predicted.—*Journal abstract*.

Time

7274. Govinda, Anagarika. **The mystery of time.** *Main Currents in Modern Thought*, 1970(Sep), Vol. 27(1), 18-23.—"The experience of time is due to movement plus memory." The less we move, either "inwardly or outwardly," the more we are aware of time. Time awareness, which is associated with the "movement of the mind," develops later than space awareness, which is associated with the movement of the body. A speculative treatment of the subject, with roots in Buddhism, is given.—*H. Ruja*.

7275. Svenson, Ola. (U. Stockholm, Psychological Lab., Sweden) **Scaling velocity and space from time estimates.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(2), 115-123.—A model described by the relation, relative estimated time = (subjective space)/(subjective velocity), is applied on time estimates collected in 3 experiments with moving spots indicating the time intervals which were estimated. The model is found to account satisfactorily for the data, thus permitting derivations of subjective scales of velocity and space.—*Journal abstract*.

7276. Vroom, P. A. (State U., Utrecht, Netherlands) **Division and retention of psychological time.** *Acta Psychologica, Amsterdam*, 1970(Aug), Vol. 32(4), 366-376.—Examines the experience of duration as a sensory-physiological process. A time base producing internal time signals that serve to code external time has previously been proposed. Coding takes place by dividing time into elements with a duration of about 100 msec. each. Evidence for this basic unit is reviewed with regard to the applied statistical techniques. An experiment indicates that some demonstrations of the time quantum rest upon less suitable mathematical operations. Another experiment contributes to discussions around the storage mechanism for single intervals.—*Journal abstract*.

VISION

7277. Baker, C. H. (Defense Research Establishment, Toronto, Ontario, Canada) **A study of the Sherrington effect.** *Perception & Psychophysics*, 1970(Dec), Vol. 8(6), 406-410.—In studies of binocular fusion of flicker, C. S. Sherrington found a very small difference between CFFs when the eyes were synchronously or alternately stimulated by 2 binocularly fused test patches. It was concluded that the phenomena of alliance and antagonism which had been demonstrated in the motor system did not obtain in the sensory (visual) system. Later studies found the Sherrington effect to be slightly larger than Sherrington reported, which has been held as evidence of a definite, though small, degree of binocular interaction. In the present study, with 24 trained Os, the

Sherrington effect was found to be about 5 times greater than previously reported.—*Journal abstract.*

7278. Lewis, Mark F. & Mertens, Henry W. (FAA, Civil Aeromedical Inst., Oklahoma City, Okla.) **Two-flash thresholds as a function of comparison stimulus duration.** *FAA Office of Aviation Medicine Report*, 1970(Sep), No. 70-15, 4 p.—2-flash thresholds were an increasing function of comparison stimulus duration (3–22 msec.), with increased luminance (1–3 log mL.) heightening the effect.—*W. E. Collins.*

7279. Rvachëv, V. P. **Vvedenie v biofizicheskuyu fotometriyu.** [Introduction to biophysical photometry.] Lvov, USSR: Lvov U., 1966. 379 p.—Presents a systematic exposition, including the elements of the biophysics of vision.—*I. D. London.*

7280. Zacks, James L. (U. Pennsylvania) **Temporal summation phenomena at threshold: Their relation to visual mechanisms.** *Science*, 1970(Oct), Vol. 170(3954), 197–199.—Determined threshold energies for brief flashes as a function of their duration to ascertain the maximum duration for which the flash intensity and duration could be varied reciprocally without affecting detectability (the Bunsen-Roscoe effect). A pair of threshold-level flashes, for which reciprocity obtained in the determination of threshold, were shown to be discriminable from each other at several imperfectly detectable energy levels. Thus equal detectability of flashes of equal energy does not imply identical neural responses to such stimuli. It is suggested that the summation reflects primarily the operation of the detection mechanism rather than of the peripheral visual mechanism.—*Journal abstract.*

Perception

7281. Collyer, Stanley C. & Bevan, William. (Johns Hopkins U.) **Objective measurement of dominance control in binocular rivalry.** *Perception & Psychophysics*, 1970(Dec), Vol. 8(6), 437–439.—6 male undergraduates attempted to identify stimuli superimposed on either of 2 dichoptically viewed rivalry patterns. Ability to influence dominance switches was confirmed with this objective procedure, by reason of a decreased error rate (a) with 3-sec advance knowledge as to which pattern would receive a test stimulus, and (b) with knowledge that an 83% majority of all stimuli would be presented in a given field. However, even when test stimuli were self-initiated, dominant-field and suppressed-field scores were not close to the error rates predicted on the basis of monocular levels and of random guessing, respectively, indicating either misjudgments of pattern dominance or, more likely, a failure of the dominant field to totally suppress its opponent.—*Journal abstract.*

7282. Colquhoun, W. Peter & Edwards, Robert S. (Medical Research Council, Applied Psychology Unit, Cambridge, England) **Practice effects on a visual vigilance task with and without search.** *Human Factors*, 1970(Dec), Vol. 12(6), 537–545.—Studied changes in performance at a visual vigilance task over 8 40-min sessions in 3 groups of 8 male adults. The task was to inspect a series of displays of small disks for the occasional presence of a disk of slightly greater area than the others. For 1 group (search), each display consisted of a row of 6 disks. For 1 of the 2 no-search groups, the display contained 2 adjacent disks, 1 of which served as a reference standard; for the other group this reference disk was absent. Substantial improvement in overall

detection rate occurred in all 3 groups. Analysis indicates that in each case this improvement was due to a genuine increase in discriminatory efficiency and not to any change in response criterion. Neither search nor the presence or absence of a reference standard appeared to affect the degree of improvement observed to any marked extent. Within-session decrement was observed only in the search group; this decrement was found to result from a change in response criterion, and not from any alteration either in discriminatory efficiency or search strategy. 7283. Dick, A. O. & Dick, S. O. (Lake Forest Coll.) **An analysis of hierarchical processing in visual perception.** *Canadian Journal of Psychology*, 1969(Jun), Vol. 23(3), 203–211.—Perception is viewed as a process in which attributes of a stimulus are analyzed in step-wise fashion. 2 experiments with 19 undergraduates, were carried out in which the attributes of spatial location and identity were examined for 2 types of materials. Results indicate that identification of letters requires more stimulus energy than identification of lines. There were no differences between identification of lines, localization of lines, or localization of letters. In general, results support a hierarchical processing hypothesis. (French summary)—*Journal abstract.*

7284. Foley, Joan E. (U. Toronto, Ontario, Canada) **Prism adaptation with simultaneous receipt of normal input.** *Perception & Psychophysics*, 1970(Dec), Vol. 8(6), 393–395.—In an experiment with 160 17–40 yr. old university and high school students, a 20-diopter vertically-displacing prism was worn on 1 eye in conjunction with plane glass on the other. 5 groups of Ss differed in the density of a neutral filter worn over 1 eye. No aftereffect could be measured in either eye in any condition where the luminance of the normal field was equal to or greater than that of the prism field. It is concluded that as the luminance of the normal field is decreased below that of the prism field, the magnitude of aftereffect increases and is measurable in each eye.—*Journal abstract.*

7285. Gibson, James J. (Cornell U., Graduate Research Lab.) **On theories for visual space perception: A reply to Johansson.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(2), 75–79.—Responds to G. Johansson's (see PA, Vol. 45:Issue 4) criticism that J. J. Gibson's "theory of stimulus information goes to an extreme and does not recognize the contribution of the organism to perception." It is argued that it is impossible to weigh the subjectivity of perception, and that Gibson's theory of available stimulus information outside the eyes of an O and explored by him avoids both nativism and empiricism. It is further suggested that Johansson, in calling Gibson's theory a "locomotor theory of space perception," fails to understand that Gibson's theory "goes hand in hand with a theory of proprioception" and that "a perceiver picks up information about the layout of the environment directly, and does so the more readily when the object moves or when he himself moves."—*M. Maney.*

7286. Johansson, Gunnar. (U. Uppsala, Sweden) **On theories for visual space perception: A letter to Gibson.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(2), 67–74.—As part of a discussion on J. J. Gibson's book, *The Senses Considered as Perceptual Systems*, his construct "ecological optics" is analyzed in 2 ways: from a systematical viewpoint, and from the viewpoint of the validity of the application of the basic rules in his theory

for space perception. The main point of controversy concerns the role of the organism. Gibson's theory is characterized as belonging to the empiristic type, and a deviating theory is outlined and characterized as a pure nativistic 1, concerned with the primary biological programming of the visual system. It is argued that research based on the latter theory avoids both an "appeal to subjectivity in the basic functions of the visual apparatus" and "an unstructured belief in stimulus information."—*M. Maney.*

7287. **Kinchla, R. A. & Allan, Lorraine G.** (Princeton U.) **Visual movement perception: A comparison of sensitivity to vertical and horizontal movement.** *Perception & Psychophysics*, 1970(Dec), Vol. 8(6), 399-405.—Utilized a psychophysical model providing separate measures of judgmental standards and sensitivity to compare 5 Os' visual sensitivity for vertical and horizontal movement. Analysis indicates no consistent difference in sensitivity; those asymmetries that did exist appeared to be due to idiosyncratic judgmental standards.—*Journal abstract.*

7288. **Krueger, Lester E.** (City Coll., City U. New York) **Visual comparison in a redundant display.** *Cognitive Psychology*, 1970(Oct), Vol. 1(4), 341-357.—Ss saw a target letter centered immediately above a 6-letter word or nonword (scrambled collection of letters), and indicated whether the word or nonword contained the target. Ss responded faster for words than nonwords. The time savings for words persisted when a replica of the target letter was placed adjacent to each letter in the 6-letter item—but only when the item was arrayed horizontally, and not when it was arrayed vertically. Similar time savings for words were obtained when, instead of presenting the target letter and 6-letter item simultaneously (visual comparison), the target letter was shown immediately before (visual search) or immediately after (memory search) the 6-letter item.—*Journal abstract.*

7289. **Leibovich, Nora B. & Paolera, Mercédès B.** (U. Buenos Aires, School of Philosophy & Literature, Argentina) **Recherche sur la perception de la couleur et de la post-image en relation avec des images significatives.** [Research on the perception of color and post-image in relation to significant images.] *Annales Médico-Psychologiques*, 1970(May), Vol. 1(5), 735-741.—Recent theory states that the less ambiguous visual perceptual material is, the less will be the influence of past experience on its interpretation. Since most experiments testing this hypothesis have used direct vision, the present series employs the interpretation of colored afterimages as dependent variable. Stimuli were selected to include color as a significant identifying element for the afterimage, e.g., yellow for canary, or to be arbitrary and without meaning. In no instance was any reliable difference found. The physiological levels needed for identification of the afterimages were not modified by the meaningfulness of their color.—*H. E. King.*

7290. **Lin, Pi-Fong.** (National Taiwan U., Taipei) **S-R contingency and visual-detection threshold.** *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 112-120.—Compared the SR contingent method and the SR noncontingent method in measuring the detection threshold of visual sense modality. It was hypothesized that (a) the detection threshold obtained by the SR contingency method would be more stable than that obtained by the SR noncontingent method, and (b) that stimulus with short duration is superior to stimulus with

long duration in determining detection threshold. Results, with 45 undergraduates, do not support either hypothesis and indicate no significant differences between methods in either case.—*Journal abstract.*

7291. **MacKinnon, G. E., Forde, J., & Piggins, D. J.** (U. Waterloo, Ontario, Canada) **Stabilized images, steadily fixated figures, and prolonged after-images.** *Canadian Journal of Psychology*, 1969(Jun), Vol. 23(3), 184-195.—3 Ss, with normal visual fields, viewed an outline figure of a square as a stabilized image, a steadily fixated figure, and a prolonged afterimage. Ss recorded quantitatively the fading and regeneration of the sides of the figure. The fragmentation of perception that occurred under the 3 viewing conditions was highly similar. Results support the idea that a single mechanism in the CNS underlies fragmentation. (French summary)—*Journal abstract.*

This relation was studied with 4 types of alignment marks and 2 extreme levels of ambient illumination. Ss were 10 male undergraduates with 20/20 vision. The vertical separations ranged from .05-3.2 in. A significant interaction was found between vertical separation distance and alignment mark design: designs which provided vernier cues were the most effective at greater vertical separation distances. The relation between alignment error and vertical separation can be described by a 3rd-order polynomial.—*Journal abstract.*

7295. **Uttal, William R., Bunnell, Lynne M., & Corwin, Stuart.** (U. Michigan) **On the detectability of straight lines in visual noise: An extension of French's paradigm into the millisecond domain.** *Perception & Psychophysics*, 1970(Dec), Vol. 8(6), 385-388.—Investigated the effects of 4 experimental parameters on the tachistoscopic detectability of dotted lines in a noisy background consisting of dynamic patterns of identical dots. Ss were 4 experimentally naive undergraduates. Line characteristics explored included dot spacing, dot numerosity, and line orientation. Dot spacing was the most powerful parameter in determining the masking effect: the closer the dots, the more easily the line was detected. Increasing the number of dots was also effective, but only up to 5 dots. The orientation of the line, however, did not alter its detectability. Increasing the density of the visual masking noise monotonically

reduced the detectability of the line. These studies are an extension of R. S. French's (see PA, Vol. 28:3772, and 8399) work, differing mainly in the fact that stimulus material was presented tachistoscopically rather than in a mode that allowed prolonged (up to 5 sec.) examination of the figures. A comparison of results indicates similar cognitive mechanisms operating in the msec. domain and in the longer exposures. This suggests that simple neurological models, utilizing the concept of feature filters or detectors, may be being prematurely applied to relatively complex perceptual processes. (18 ref.)—*Journal abstract.*

7297. Welch, Robert B. & Rhoades, Robert W. (U. Kansas) **The manipulation of informational feedback and its effects upon prism adaptation.** *Canadian Journal of Psychology*, 1969(Dec), Vol. 23(6), 415-428.—Supplied 88 volunteers, primarily college students, in 4 groups, with varying amounts and types of information regarding the nature of their visual fields, which in 3 cases were laterally displaced by means of a 20-diopter wedge prism. Ss who experienced (a) target-pointing error, (b) proprioception-vision discrepancy, and (c) reafference-reafference discrepancy during the prism-exposure period (target group) adapted more than Ss exposed to only the latter 2 sources of information (no-target group). This difference in adaptation was seen in both negative aftereffect (NA) and proprioceptive shift (PS). In a 3rd condition (no-error group) Ss were induced to experience their target pointing as accurate, while at the same time being exposed to discrepancies between proprioception and vision and between "old" and "new" reafference. This experimental condition resulted in 0 NA but a significant PS. In a 4th condition (no-prism group), in which target-pointing errors were experienced but the 2 sensory discrepancies did not exist, a significant NA resulted, but no PS. Because NA and PS were not highly correlated with each other and were differentially affected by the experimental manipulations, it is suggested that they represent qualitatively different forms of adaptation. (French summary) (44 ref.)—*Journal abstract.*

Size & Distance & Depth Perception

7298. Carlson, V. R. & Tassone, E. P. (National Inst. of Mental Health, Lab. of Psychology, Bethesda, Md.) **Familiar versus unfamiliar size: A theoretical derivation and test.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 109-115.—Questions on theoretical grounds the result recently reported by H. W. Leibowitz and L. O. Harvey (see PA, Vol. 43:12118), that at appreciable distances an unfamiliar object is judged larger than a familiar object in both apparent and objective size. The prediction was derived on the basis of the perspective attitude that an object of familiar size might be seen as more distant, equal, or smaller in apparent size, and equal or larger in objective size. 88 undergraduates made size and distance judgments comparing a girl wearing a white lab coat and standing 183 m. from S, with a fluorescent-red or flat-white board of the same height and at the same distance. Results indicate that the girl was seen to be more distant, shorter

in apparent height, and equal or taller in objective height, in agreement with the perspective attitude but not with size-distance invariance. It is argued that both processes may have been operating simultaneously.—*Journal abstract.*

7299. Gärling, Tommy. (U. Stockholm, Psychological Lab., Sweden) **Studies in visual perception of architectural spaces and rooms: III. A relation between judged depth and size of space.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(2), 124-131.—Tested the hypothesis that perceived size of space depends on perceived depth, by deriving a relation between judged depth and size of space. External spaces were judged by 24 undergraduates from color photographs by the magnitude estimation method. It was found that judged depth is a power function of physical depth and judged size of space a power function of physical size (rectangular area) or of judged depth times perceived width. Results indicate deviations from the derived relation and some explanations for these are discussed. Further research is needed to verify the proposed hypothesis.—*Journal abstract.*

7300. Kimura, Doreen. (U. Western Ontario, London, Canada) **Spatial localization in left and right visual fields.** *Canadian Journal of Psychology*, 1969(Dec), Vol. 23(6), 445-458.—Presented a series of single dots tachistoscopically in either the left or the right visual field, Ss task being to locate the dot on a spatial map depicting all of the lot locations presented. 7 experiments were carried out with 232 right-handed male and female undergraduates. For men, localization of the dot was more accurate in the left than in the right visual field, under all testing conditions. Women showed the left-field superiority under some testing conditions; under others they showed no difference between fields. There was no sex difference in over-all accuracy of performance, and simple detection of a dot was not more accurate in 1 field than another for either sex. Results are discussed in terms of a probable "spatial coordinate" system in the right hemisphere of the brain. (French summary) (15 ref.)—*Journal abstract.*

Color Vision

7301. Allen, Eugene. (Lehigh U.) **Metamerism: A study in dimension.** *Color Engineering*, 1968(Nov), Vol. 6(6), 38-43.—Metamerism, a basic principle of color vision theory, is allegorically explained by the "Spectros," an enlightened people who have spectroradiometers instead of cones in the retinas of their eyes.—*Journal abstract.*

7302. Boynton, Robert M. (U. Rochester) **Mechanisms of color vision.** *Color Engineering*, 1968(Sep), Vol. 6(5), 43-48.—Describes some of the recent advances in the understanding of color vision that have occurred through the application of new techniques which allow a more direct examination of the S than was previously possible. References are given to allow exploration of the S in more depth. (18 ref.)—*Journal abstract.*

7304. Jacobson, J. Zachary & MacKinnon, G. E. (U. Waterloo, Ontario, Canada) **Coloured Mach bands.** *Canadian Journal of Psychology*, 1969(Feb), Vol. 23(1), 56-65.—Opponent-process theory of color vision pre-

dicts that a saturation gradient in the distal stimulus should produce a subjective enhancement of saturation at the edge of the gradient (colored Mach band). 2 experiments with 4 graduate students investigated this prediction. Results demonstrate a colored Mach band where there were 2 inducing step-wise saturation gradients bordering a region of the distal stimulus. Data support the opponent-process theory. (French summary) (27 ref.)—*Journal abstract*.

7305. May, James G. (U. Houston) **Electrophysiological and psychological measures of spectral sensitivity obtained with an alternating barred pattern.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1567.

7306. Stone, Leroy A. & Coles, Gary J. (U. North Dakota) **Dimensions of color vision revisited.** *Journal of Psychology*, 1971(Jan), Vol. 77(1), 79-87.—Used a new and improved similarity-analysis multidimensional scaling method to reanalyze judgmental data from 2 investigations which involved stimuli (colored lights) that had color hue differences. The multidimensional scaling results resemble the fundamental curves specified by an opponent-process theory of color vision. (16 ref.)—*Author abstract*.

Form & Pattern Discrimination

7307. Frederickson, Edward W. (Baylor U.) **Shape perception judgments as a function of stimulus orientation, stimulus background and perceptual style.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1578-1579.

7308. Grove, Michael S. & Eisenman, Russell. (Temple U.) **Complexity-simplicity, symmetry-asymmetry, and sociometric choice.** *Perception & Psychophysics*, 1970(Dec), Vol. 8(6), 427-429.—Studied the interrelationships associated with shape preference. 30 undergraduates made complexity-simplicity and symmetry-asymmetry choices, and also made and predicted sociometric choices of others. Ss who preferred complexity tended to choose Ss who preferred symmetry, which was interpreted as complementary choice. Other findings suggest that complexity and asymmetry are not identical, although there is some relationship between the 2. (15 ref.)—*Journal abstract*.

Eye Movement

Brightness & Contrast Discrimination

7309. Allport, D. A. (U. Reading, England) **Temporal summation and phenomenal simultaneity: Experiments with the radius display.** *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 686-701.—Explores the phenomenon of subjective simultaneity between multiple successive positions of a target, which consisted here of an illuminated radial line in both stepwise and continuous rotation around a fixation point. In 4 experiments with 12, 11, 15, and 11 undergraduate and graduate students, respectively, the span of phenomenal simultaneity (M) was measured under varying intensities of target and surround, and with 2 different estimation procedures. M was found to change as a power function of target intensity, with an exponent of $-.13$ or $-.16$, for both stroboscopic and continuous illumination of the target. Variation of

surround intensity affected M only for 9 Ss in Exp. III. For these Ss M varied inversely with $\log I$ of the surround; for the remaining 6 Ss, M remained approximately constant over a range of 5 log units of I. Auditory noise tended slightly to decrease M in the former group and to increase it in the latter. Under simultaneous continuous and stroboscopic illumination of the target a paradoxical, single-valued M was obtained (Exp. IV). Higher values of M were found when Ss attempted to estimate the number of apparently simultaneous radii (Exp. I). The function relating M to target intensity closely parallels that for the critical duration of temporal brightness summation. The possibility that both measures reflect the same underlying process is discussed. (22 ref.)—*Journal abstract*.

AUDITION

Perception

7310. Brown, John & Routh, David A. (U. Bristol, England) **Recognition assessed by d' and by a non-parametric alternative (the A-index) as a function of the number of choices.** *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 707-719.—Freedom from restrictive assumptions and ease of psychological interpretation are 2 basic criteria for a satisfactory measure of recognition performance. The A-index comes close to fulfilling these criteria. It is based on the proportion of wrong choices rejected in a multichoice test as revealed by the number of choices required to select the correct choice. It can be transformed into the d' measure of signal detection theory (SDT) if the standard assumptions of this theory hold, but not in general. 2 experiments on the recognition of words-in-noise are described. In Exp. I with 7 20-30 yr. old Ss, there were 3, 5, 8, or 16 choices. They were typed on a card which was displayed to the listener during the presentation of a word. On both measures 5-, 8-, and 16-choice recognition did not differ significantly, while 3-choice recognition was slightly, but significantly, superior. Exp. II with 8 undergraduates concerned the effect of delaying the display of the card until 2 sec. after presentation. No evidence for an effect was obtained. In both experiments, there is suggestive but not conclusive evidence that the d' measure tended to overestimate recognition efficiency. (20 ref.)—*Journal abstract*.

7311. Bryden, M. P. (U. Waterloo, Ontario, Canada) **Binaural competition and division of attention as determinants of the laterality effect in dichotic listening.** *Canadian Journal of Psychology*, 1969(Apr), Vol. 23(2), 101-113.—In the normal dichotic listening procedure, there is competition between 2 inputs arriving simultaneously. Also, S must attend to both ears at the same time. In a series of 4 experiments, with over 80 undergraduates, these 2 factors were manipulated independently to assess their relative contributions to the laterality effect. In the 1st 3 experiments, conditions were employed in which the input was always monaurally presented, but the S did not know in advance where the material would arrive. In Exp. IV, the preinstruction condition provided a situation in which the S could direct his attention to a single channel. Results indicate that competition is both necessary and sufficient for a right-ear superiority to be observed. The necessity of attending to 2 channels at the same time does not seem

to influence the laterality effect in any way. (French summary)—*Journal abstract*.

7312. Canah, Julius A. (Veterans Administration Hosp., Atlanta, Ga.) **Binaural masking of a tone by a tone plus noise.** *Journal of the Acoustical Society of America*, 1970(Feb), Vol. 47(2, Pt. 2), 476-479.—Hypothesized that the release from masking observed when noise is masking a tone signal would be affected by the addition of a tone masker. If the level of the tone masker is increased to a high enough value, there should be no release from masking. Results of the study with 3 normal hearing Ss show that a pure-tone masker does reduce the size of the magnitude of the release from masking as a function of the level of the masking tone, but not to 0 as was predicted. The effect was found to be differential with respect to the phase of the tone masker and is explained in terms of the interaural correlation of the total masker waveform. Some evidence is presented that indicates release from masking occurs when a tone is used to mask another tone.—*Journal abstract*.

7313. Corcoran, D. W., Dennett, J. L., & Carpenter, A. (Cambridge U., Medical Research Council, England) **Cooperation of listener and computer in a recognition task: Effects of listener reliability.** *Journal of the Acoustical Society of America*, 1970(Feb), Vol. 47(2, Pt. 2), 480-488.—Investigated (a) the influence of a computer display on the ability of listeners to recognize complex sounds, (b) what effect variations in audio signal-to-noise (S/N) ratio would have on combined performance, and (c) the strategy used by the listener to combine the computer with audio evidence. 33 Naval Ratings were tested over 12 1½-hr sessions. Listening performance, computer performance, and listener-plus-computer performance (C and Li) were assessed. It was found: (a) that the computer display was effective in producing better recognition; (b) that the higher the S/N ratio, the greater C and Li performance; (c) that the lower the S/N ratio, the greater the utilization of the computer information; (d) that the utilization of the computer evidence did not improve with training; and (e) that a relatively simple additive model described the method by which Ss combined the 2 sources of evidence.—*Journal abstract*.

7314. Gol'dburt, S. N. & Loginova, M. P. (Leningrad State U., USSR) **Zavisimost' absolyutnoi otsenki vysoty tona ot ego dlitel'nosti i mikrointervala mezhdu nim i vtorym tonom.** [Absolute judgment of pitch of tone as a function of its duration and the microinterval between it and a second tone.] *Nervnaya Sistema*, 1968, No. 9, 133-140.—Ss were 2 women with a "fine musical ear." 3 series of experiments investigated absolute judgment of pitch of tone (over ranges from 200-600 cps and from 200-3000 cps) as a function of: (a) its duration when presented in isolation; (b) the microinterval (20, 50, and 260 msec.) between it and a 2nd tone (of same duration, but 100 cps higher), given 7 gradations of pitch over the range; and (c) similarly, but given 6 gradations of pitch. In judging the 7 categories of pitch over a range of frequencies for the first of a pair of tones, separated by a 20- or 50-sec interval, the number correctly identified was distinctly less than in the case of a single tone. In the case of a range including 6 categories of pitch, the same decline of correct identification was observed, but to a lesser extent. In both instances the effect was greater for the middle tones of the utilized range.—I. D. London.

7315. Massaro, Dominic W. (U. Wisconsin) **Effect of**

masking tone duration on preperceptual auditory images. *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 146-148.—3 paid undergraduates identified the pitch of a 20-msec test tone as high or low. The test tone was followed by a masking tone after a variable silent intertone interval. Pitch identification performance improved with increases in the silent intertone interval indicating that an auditory image remains for processing after a short tone is presented. Presentation of the masking tone precludes perceptual processing of the auditory image of the test tone. Results also indicate that the interference produced by the masking tone was independent of its duration. This supports the hypothesis that the onset of the masking tone interferes with or overwrites the auditory image of the test tone directly.—*Journal abstract*.

7316. Moore, Thomas J. & Welsh, John R. (Aerospace Medical Research Lab., Wright-Patterson Air Force Base, O.) **Forward and backward enhancement of sensitivity in the auditory system.** *Journal of the Acoustical Society of America*, 1970(Feb), Vol. 47(2, Pt. 2), 534-539.—Investigated enhanced sensitivity of the auditory system dependent upon exposure to short (1-msec) acoustic stimuli, using 5 male undergraduates. When the dichotic condition was investigated, little or no enhancement was found. When the monotic condition was employed, there was evidence for both forward and backward enhancement. Backward enhancement occurred only when the stimulating click was just above threshold—3-db sensation level (SL). Forward enhancement was present to some extent for all intensities of stimulation (3-, 10-, 20-, 40-db SL) employed.—*Journal abstract*.

7317. Nielsen, Donald W., Fraser, Winifred D., & Elliott, Donald N. (U. Florida) **Frequency discrimination in the adapted ear.** *Journal of the Acoustical Society of America*, 1970(Feb), Vol. 47(2, Pt. 2), 540-545.—Investigated the effects of adaptation on monotic and dichotic frequency-DL and on pitch shift. 5 female and 1 male experimentally naive undergraduates were tested under normal and adapted conditions at 2 frequencies—250 and 1000 Hz., 2 intensities—40-db sensation level (SL), and with 2 modes of presentation—monotic and dichotic. Frequency-DL and constant-error (CE) measures were calculated. Frequency-DL analysis showed significant results for the main effects of frequency, adaptation, and mode of presentation. Results of the CE analysis showed no statistical significance. (24 ref.)—*Journal abstract*.

7318. Tominaga, Yoshio. (Inst. for Science of Labour, Lab. of Hygiene, Tokyo, Japan) [The choice reaction time in response to the direction of tonal signals under noise: The effect of the use of earplugs.] *Journal of Science of Labour*, 1969(Oct), Vol. 45(10), 594-604.—As an indicator of detectability or discriminability of the tonal signal, the choice reaction time (CRT) in response to the direction of the warble tone emitted from one of the speakers located in the directions 45° right and left in front of the S was examined under broad band noise emphasized at low frequencies. Results indicate that the CRT depends approximately on the sensation level of the signal or signal to noise ratio. The CRT was also affected by the stimulus series. In an experimental block in which both the signal level and the noise level were constant, the CRT was relatively short. When both levels were randomly varied, longer CRT was obtained and the CRT for signals of the same sensation level tended to

vary depending on the received level of the signal. CRT for 40-db signal and 20-db noise (critical band level) was longer than that for 60-db signal and 40-db noise. If the experimental results are considered in relation to workers listening to tonal signals in plant with constant noise, it is suggested that frequent wearing and removing of ear plugs may give unfavorable effect upon detection of auditory signals although constant use of ear plugs does not. (16 ref.)—*English abstract.*

Speech Discrimination

7319. Bertelson, Paul & Tisseyre, Françoise. (Free U., Brussels, Belgium) **Perceiving the sequence of speech and non-speech stimuli.** *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 653-662.—28, 16, and 16 undergraduates in 3 experiments estimated on which syllable of a spoken sentence a click was superimposed. Exp. I confirms P. Ladefoged and D. E. Broadbent's (see PA, Vol. 35:1628) finding of a systematic tendency to prepose the click (negative displacement), but shows also that the tendency is decreased when prior knowledge of the sentence is provided. Exp. II shows that acoustic prior knowledge is not necessary to produce the decrease and that it occurs also with textual prior knowledge. Exp. III shows that the negative displacement is not eliminated by short-term practice on the task, as J. Fodor and T. G. Bever (see PA, Vol. 40:1532) contended. The effect of prior knowledge is inconsistent with the explanation of negative displacement in terms of attention demands suggested by Ladefoged and Broadbent. It is argued that this explanation was unnecessary, and that negative displacement can be expected in a system which analyzes speech by discrete units. (15 ref.)—*Journal abstract.*

Audiometry

text and body-concept. *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1533.

7323. Gescheider, George A., Herman, Daniel D., & Phillips, Jeffrey N. (Hamilton Coll.) **Criterion shifts in the measurement of tactile masking.** *Perception & Psychophysics*, 1970(Dec), Vol. 8(6), 433-436.—Determined the effects of method of threshold measurement on the amount of threshold shift produced by a masking stimulus. 4 experiments were made with 13 undergraduates and faculty members. The amount of contralateral tactile masking of the fingertip was found to be much greater when thresholds were measured by the Békésy tracking method than when measured by a forced-choice method. When the Békésy tracking procedure was modified, so that each observation interval containing a brief stimulus was followed almost immediately by a 2nd observation interval not containing a stimulus, the amount of masking was substantially reduced for both contralateral tactile masking and auditory-tactile masking and corresponded almost exactly with the amount of masking measured by the forced-choice method. No such reduction in the amount of masking was obtained by using this procedure to measure ipsilateral tactile or auditory masking.—*Journal abstract.*

ENVIRONMENTAL EFFECTS

SLEEP & FATIGUE & DREAMS

7324. Baekeland, Frederick. (State U. New York, Downstate Medical Center, Brooklyn) **Correlates of home dream recall: I. REM sleep in the laboratory as a predictor of home dream recall.** *Journal of Nervous & Mental Disease*, 1970(Mar), Vol. 150(3), 209-214.—Studied REM frequency (density) and time during the 1st 6 hr. of uninterrupted sleep in relation to various measures of home dream recall in 41 normal young adult male Ss. The incidence of detailed dream reports was significantly positively related to REM density. Vague and no-content dream reports, however, were negligibly related to REM density. Similar relationships were found between dream reporting and REM time. It is suggested that detailed dream reports tend to come from end-of-the-night awakenings from REM periods with much eye movement activity, while vague and no-content reports are derived either from NREM awakenings or from REM period awakenings occurring earlier in the night and from which the S returns to sleep. A questionnaire estimate of dream recall, completed by Ss before the experiment, proved to be a fair predictor of later detailed dream recall as measured by a sleep log kept for 14 consecutive days and was thought to sample the delayed recall of vivid dreams from end-of-the-night REM periods with high REM densities. 7327. Evans, Frederick J., et al. (Inst. of the

Pennsylvania Hosp., Unit for Experimental Psychiatry, Philadelphia) **Verbally induced behavioral responses during sleep.** *Journal of Nervous & Mental Disease*, 1970(Mar), Vol. 150(3), 171-187.—Elicited motor responses from 19 Ss, sleeping in a laboratory for 2 nights. Some Ss responded behaviorally, while remaining asleep, to verbal suggestions administered previously during Stage-1 sleep. Many responses were obtained without eliciting alpha activity during the suggestion, after the cue word was administered, or before and after the response. When a successful response occurred, alpha frequency was not significantly different from the slowed frequency occurring spontaneously during Stage-1 sleep. The average response latency was 32 sec., and this increased as the temporal dissociation between the administration of the suggestion and the cue word increased. After awakening, S did not remember the verbally presented material, or responding to it, and did not respond to the cue word. When S returned to sleep the next night, or even 5 mo. later, the mere repetition of the relevant cue word (without repetition of the suggestion itself) was sufficient to elicit the appropriate response. It is concluded that a S is capable of some interaction with his environment while he is asleep. (29 ref.)—*Journal abstract*.

7328. Grosser, George S. & Siegal, Andrew W. (American International Coll.) **Emergence of a tonic-phasic model for sleep and dreaming: Behavioral and physiological observations.** *Psychological Bulletin*, 1971(Jan), Vol. 75(1), 60-72.—Presents the early evidence for, and later evidence against, theories which consider waking, sleep, and dreaming as discrete states. The newer tonic-phasic model proposed by G. Moruzzi is reviewed. Support for it is drawn from research on the behavior of the CNS, autonomic nervous system, musculature, and mentation as observed during the various stages of sleep. The neurophysiological basis of tonic-phasic events is summarized. The advantages of the tonic-phasic model over a 3-state model are that only the former can accommodate both (a) the heterogeneity of Stage-REM events, and (b) the continuity of certain phenomena throughout all sleep stages. It is concluded that, while the older model was valuable in generating research and methodological innovations, these very developments have made it obsolete. The tonic-phasic model is better suited to the present state of knowledge, and promises to be a valuable guide for further research. (88 ref.)—*Journal abstract*.

Menninger Dream Lab., Brooklyn, N.Y.) **Hypnosis and psychedelia.** *Journal of the American Society of Psychosomatic Dentistry & Medicine*, 1970, Vol. 17(2), 58-68.—Psychedelic states and hypnotic states are not discrete entities. Psychedelic experiences can be reproduced by hypnotic induction.—M. V. Kline.

7334. O'Connell, Donald N., Shor, Ronald E., & Orne, Martin T. (Massachusetts Mental Health Center, Boston) **Hypnotic age regression: An empirical and methodological analysis.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 2), 32 p.—Made a repetition, with additional control groups, of R. Reiff and M. Scheerer's (see PA, Vol. 35:931) study of hypermnnesia through reinstatement of prior cognitive modes of functioning during hypnotic age regression to ages 10, 7, and 4. Only partial replication of the original findings was obtained. Tests amenable to the influence of E expectation and demand characteristics showed the least replication. Tests resistant to such influences replicated well. No evidence of hypermnnesia was found. Comparisons with other control (or quasicontrol) groups show: (a) equal performance of cryptosimulating Ss in the absence of hypnosis, (b) evidence for confounding in the original study of treatment and design effects, (c) moderate effect of presence or absence of role support in a quasiparticipant group, and (d) fairly good behavioral validity in direct comparisons with children. Evidence for transcendence during hypnosis of waking role-playing behavior was lacking, although striking subjective alterations were present in hypnosis. Methodological implications of these findings are stressed. (52 ref.)—*Journal abstract*.

7342. Quarter, Jack & Marcus, Allan. (Ontario Inst. for Studies in Education, Toronto, Canada) Drive level and audience effect: A test of Zajonc's theory. *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 99-105.—Tested R. B. Zajonc's theory that the presence of an audience during a digit span test causes an increment in drive level and a concomitant impairment of performance. 68 8th graders were employed in a 2 × 2 design, with drive level as inferred from test anxiety scores and presence of an audience as independent variables. Although audience effect was significant, the interaction between drive level and audience present-absence did not materialize as predicted. It was posited that affiliative anxiety rather than test anxiety was contributing to a drive increment in the audience present condition. Data were reanalyzed after substituting birth order, a correlate of affiliative anxiety, for test anxiety as an independent variable. The interaction was then obtained and reached significance. ATTENTION & EXPECTANCY & SET

7345. Davenport, W. G. (U. Newcastle, New South Wales, Australia) Vigilance for simultaneous auditory and cutaneous signals. *Canadian Journal of Psychology*, 1969(Apr), Vol. 23(2), 93-100.—Required 16 un-

dergraduates in a vigilance situation, to perform 3 separate 40-min watches: auditory (A), vibratory-cutaneous (C), and simultaneous auditory-cutaneous (AC), to ascertain whether an improved correct detection rate might be obtained by increasing the number of display channels to a single O. Results show that the AC channel had a significantly higher correct detection rate than either the A or C channels alone, and the A channel was significantly superior to the C channel. Also there was a significant decrement in the frequency of correct detections over time for the A and C channels alone, and, in each case, a significant increase in Ss' thresholds taken before and after the 40-min watch period. There was an insignificant increase for the AC channel. Paralleling these changes were large increases over time in Ss' criterion (β) for the A and C channels, and a small increase for the AC channel. The auditory and vibratory-cutaneous senses appear to be interdependent; perhaps there is an important relationship between change of Ss' threshold and criterion (β). (French summary)—*Journal abstract.*

7346. Eisler, Hannes & Knöppel, Jan. (U. Stockholm, Psychological Lab., Sweden) Relative attention in judgments of heterogeneous similarity. *Perception & Psychophysics*, 1970(Dec), Vol. 8(6), 520-526.—Repeated R. N. Shepard's (see PA, Vol. 39:3334) study on similarity of stimuli with clearly discernible dimensions. Some modifications were made, the most important being that the 42 Os made numerical similarity estimates of the stimulus pairs. The overall outcome did not deviate much from Shepard's findings. By using quantitative estimates and choosing stimulus series so that the 2 dimensions were negatively correlated, data for each O could be analyzed separately with a partial correlation technique. It was found that the more an O attended to 1 dimension, the less he attended to the other. The shifts in attention seemed to be random rather than regular. Consequently, the meaningfulness of a contention like Shepard's as to the nonexistence of a metric is questioned.—*Journal abstract.*

MOTOR PERFORMANCE

7352. Caldwell, Lee S. (U.S. Army Medical Research

Lab., Experimental Psychology Div., Ft. Knox, Ky.) **Decrement and recovery with repetitive maximal muscular exertions.** *Human Factors*, 1970(Dec), Vol. 12(6), 547-552.—60 adult males exerted 10 successive maximum pulls of 12½-sec duration on an isometric dynamometer handle. All trials in a series were separated by a constant duration ITI of 12½, 25, 50, 100, or 200 sec. For all ITIs there was a rapid initial reduction in output followed by an essentially linear decline. The effect of the ITIs on the within-trial decrements were quite small with a difference of less than 2% of maximum between the means for the shortest and longest intervals. For the longer rest conditions there was a reduction in the within-trial decrement over trials. For shorter ITIs, recovery tended to increase with successive rests, but for longer intervals there was a tendency for recovery to decrease with repeated rests. The amount of strength recovery with rest was influenced not only by the length of rest but also by the degree to which the response was degraded by prior performance.—*Journal abstract.*

REACTION TIME

7353. **Bandžejová, Mária.** (Comenius U., Bratislava, Czechoslovakia) **Reakčný čas (= RC) v závislosti od polohy a vzdialenosti podnetov v zrakovom poli.** [Effect of the position and distance of stimuli in the visual field on reaction time.] *Psychologica: Sborník Filozofickej Fakulty, U. Komenského, Bratislava*, 1967, Vol. 18(7), 89-109.—Presented stimuli on a hemisphere in horizontal direction, to the right of the fixation point, and in 4 distances, 10, 30, 50, and 70°, to study its effect on RT. Conclusions show: (1) RT lengthened as the stimulus moved outward from the center of the visual field; and (2) RT depended on the position of the negative stimulus. In the center, stimulus exerted a retarding influence on RT length in peripheral areas of the visual field, and in the periphery, it exerted a positive influence. (Russian & German summaries)—*English summary.*

Germany) **Eine Verallgemeinerung des Messmodells von Rasch mit einer Anwendung auf die Psychophysik der Reaktionen.** [A generalization of the metric model of Rasch and its application to the psychophysics of reactions.] *Psychologische Beiträge*, 1970, Vol. 12(1), 4-22.—Enlarged the logistic metric model of G. Rasch to N parameters that may be related to situations, persons or reactions. A model of 3 parameters is applied to the measurement of RT. (15 ref.)—*English summary.*

7356. **Osipova, O. V.** (Leningrad State U., USSR) **O znachenii veroyatnosti razdrzhitel' formirovani dvigatel'nogo stereotipa.** [On the significance of stimulus-probability in formation of a motor stereotype.] *Nervnaya Sistema*, 1968, No. 9, 114-119.—4 adults were Ss in a study of some aspects of motor RT as a function of probability of presentation of conditioned signals (finger pressing for red light, but not for green light). Random series of 100 signals were utilized with the ratio of positive to inhibitory stimuli as follows: 9:1, 8:2, and 6:4. The formation and transformation of the dynamic stereotype reflect the statistical features of the distribution of the positive and inhibitory signals applied.

Motor RT was a function not only of the absolute magnitudes, but also of the relative differences in the probability of the applied signals as compared with the preceding conditions of the experiment.—*I. D. London.*

7357. **Remington, Robert J.** (IBM Corp., Research Triangle Park, N.C.) **Analysis of sequential effects for a four-choice reaction time experiment.** *Journal of Psychology*, 1971(Jan), Vol. 77(1), 17-27.—Presents an experiment consisting of 3 experimental conditions: a 4-choice condition in which the stimulus events were equiprobable, a 4-choice condition in which 1 of the stimulus events appeared with a probability .40 while each of the other stimulus events appeared with a probability of .20. 3 female and 2 male 15-28 yr. olds served as Ss. Results reveal new information regarding the nature of the "repetition effect," i.e., the observed faster RT to repeated signals than for changed signals. Findings indicate that an adequate model of choice RT must account for sequential effects of a higher order than the popular 2nd-order repetition effect. A detailed analysis of the data clearly demonstrates the inappropriateness of a number of simplifying assumptions which have been made in previous studies of sequential effects in choice RT data.—*Author abstract.*

LEARNING

7358. **Abrams, Alvin J.** (U.S. Naval Personnel Research Activity, San Diego, Calif.) **An evaluation of self-pacing in an auditory identification learning task.** *Canadian Journal of Psychology*, 1969(Oct), Vol. 23(5), 366-383.—Investigated a method of pacing in auditory identification learning in an experiment with 127 naval service school students. Traditionally, an instructor paces the learner by controlling the stimulus presentation during learning. The W. N. Dember and R. W. Earl theory and other research suggest that a learner might effectively pace himself, provided he has access to stimuli of appropriate complexity levels. An attempt was made to contrast these 2 positions and a condition in which there was no pacing and all training was on the criterion task. Major results were: (a) self-pacing was less efficient, but not less effective, than proficiency-pacing (traditional); (b) both pacing techniques were more effective than unpaced training on the criterion task; and (c) despite attempts to meet the restrictions of the Dember and Earl theory in designing the self-paced condition, the stimulus selection behavior of Ss in that condition was not mediated by stimulus complexity alone. The applicability of the Dember and Earl theory to complex learning situations is questioned. (French summary) (19 ref.)—*Journal abstract.*

7359. **Anderson, Richard C.** (U. Illinois) **Control of student mediating processes during verbal learning and instruction.** *Review of Educational Research*, 1970(Jun), Vol. 40(3), 349-369.—Examines the thesis that the activities the student engages in when confronted with instructional tasks are of crucial importance in determining what he will learn. This thesis is discussed under several headings: attention, the attentional analysis of instructional procedures, cue encoding and associative linkage, and implications for instruction of the research on mediating process. It is concluded that several lines of evidence indicate that learning is facilitated when the task requires meaningful processing. (4 p. ref.)—*P. D. Leedy.*

7360. **Bahrack, Harry P.** (Ohio Wesleyan U.) **Dis-**

criminative and associative aspects of retroactive inhibition. *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 565-573.—Followed original learning of paired drawings of meaningful objects or of modified Chinese characters by interpolated learning in which details of drawings were changed in 1 of 2 degrees with or without rearrangement of the original pairings. 5 groups of 10 undergraduates each were tested for accuracy of identification of the original drawings and for associative matching of the original pairs. Identification errors were attributed jointly to confusion between original and interpolated drawings, and to unlearning of those features of original drawings which were in conflict with comparable features of interpolated drawings. Rearrangement of pairs during interpolated learning produced associative interference on the matching test, and additional discriminatory interference on the identification test. Effects of associative and discriminative interference on individual drawings were uncorrelated for meaningful material and only slightly correlated for meaningless material.—*Journal abstract.*

7361. Brehmer, Berndt & Lindberg, Lars-Ake. (U. Umeå, Sweden) **The relation between cue dependency and cue validity in single-cue probability learning with scaled cue and criterion variables.** *Organizational Behavior & Human Performance*, 1970(Nov), Vol. 5(6), 542-554.—Found that the relative consistency of the inference behavior of 54 undergraduates was the same for the 3 levels of cue validity .45, .70, and .90, but that Ss made more extreme inferences at lower levels of validity than at higher levels. This result indicates that the inverse relation between departure from matching and cue validity, usually found in single-cue probability learning experiments, can be explained in terms of extremeness of inferences. Since similar relations between extremeness and validity of information have been found in Bayesian studies of inference behavior, results also suggest that the correlational and Bayesian approaches may be more closely related than has, so far, been assumed.—*Journal abstract.*

7362. Burns, Richard W. & Brooks, Gary D. (U. Texas, El Paso) **What are educational processes?** *Science Teacher*, 1970(Feb), Vol. 37(2), 27-28.—Defines processes as learned, transformational entities used in learning and problem solving regardless of the methods used and subject matter being considered. Using 1 or more processes in any order to solve a problem results in a strategy. Whether strategies are or are not direct educational goals depends on their variety and uniqueness to the individual learner who applies them. The need for more research to validate processes and to define their total role in learning is stressed.—*Journal summary.*

7363. Diespecker, D. D. (Wollongong University Coll., New South Wales, Australia) **Vibrotactile learning and the locus dimension.** *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 574-582. 40 18-32 yr. old males, each of whom was randomly allocated to 1 of 4 experimental groups, learned a 26-element vibrotactile code. Each group used either 3, 4, 5, or 6 vibrators. As predicted, the performance of each group improved in the order 3-, 4-, 5-, and 6-vibrators. Although there were no significant differences between the groups there was a highly significant learning effect over 10 trials. Error analyses show that duration errors were the most frequent type of error and that intensity errors were the least frequent. It

is suggested that both the types of errors and the optimum number of loci which can be separately stimulated in this type of experiment will depend upon the spacing and arrangement of signal elements.—*Journal abstract.*

7367. Lepine, Dominique, et al. (Centre National de la Recherche Scientifique, Experimental & Comparative Psychology Lab., Paris, France) **Information positive et information négative dans l'apprentissage de concepts unidimensionnels simples.** [Positive information and negative information in simple unidimensional concept learning.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(1-3), 50-55.—Examined the hypothesis that Ss utilize negative information less well than positive information. 24 Ss were tested in a situation in which all instances, positive or negative, transmitted the same quantity of information, with the task consisting of a series of 24 problems involving identification of a concept chosen by the E. The 4 types of problems, in blocks of 2, were ++, +-, -+, and --, with red and black as modalities, the information transmitted by the positive and negative instances defined by reference to a specific ensemble of hypotheses the Ss could make concerning the object to be identified. The 1st instance made possible a reduction of hypotheses from 8-4, the 2nd from 4-1. Analysis of variance of results show that the -- condition resulted in the poorest performance, while ++ resulted in the best. Ss identified the pertinent attribute in block 1 when it was the only 1 that changed (confirming Huttenlocher's hypothesis), and tended to memorize the 1st instance. Ss learned to better utilize information relative to the 2nd instance (Block 2) when it was positive; the -- condition, being the only 1 in which the correct modality was never presented, explains the fact that the 3 other conditions gave rise to approximately equal levels of success.—*T. N. Webster.*

7368. Maley, Roger F. (U. West Virginia) **The effect of certain imitative cues upon the learning of response patterns.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 33-44.—Investigated the extent to

which an S's performance on problem-solving tasks is a function of the accuracy of a model's performance on the same tasks, by using models whose responses were programed and whose level of correctness was varied. Ss were 105 undergraduates. Results indicate that (a) at certain levels of correctness there were distinct performance decrements, (b) interference was maximal when the association was only slightly above chance, and (c) interference was related to tendencies to engage in blind imitation of the model. It was also found that the influence which the success of a model has on an S is generalizable to new situations, even if the S did poorly on the 1st task because the model's behavior was confusing.—*Journal summary.*

7369. Pollio, Howard R. & Reinhart, Daniel. (U. Tennessee) **Rules and counting behavior.** *Cognitive Psychology*, 1970(Oct), Vol. 1(4), 388-402.—2 different experiments were run to determine how college students learn to count in nonbase₁₀ number systems. Results indicate the Ss can and do acquire this ability inductively with the characteristics of this acquisition strongly determined by the formal properties of the system. In addition to knowing how to count, Ss who learned these systems subsequently were able to do novel tasks requiring manipulation of the new system. These results were interpreted to mean that successful nonbase₁₀ counting requires the adult S first to discover the pool of acceptable numerical elements and then to formulate a rule enabling him to produce the uniquely acceptable sequence of numbers required by the base system presently under consideration.—*Journal abstract.*

7370. Roberts, Dennis M., King, F. J., & Kropp, Russell P. (Ontario Inst. for Studies in Education, Toronto, Canada) **An empirical investigation of Ferguson's theory of human abilities.** *Canadian Journal of Psychology*, 1969(Aug), Vol. 23(2), 254-267.—Investigated 4 derivations of G. Ferguson's (see PA, Vol. 29:2097, and 32:1283) theory of human abilities: (a) abilities exert themselves differentially in different learning situations; (b) abilities are differentially related to performance at different stages of practice; (c) sufficient practice on a given task may develop into an ability to perform that type of task; (d) an aptitude developed from practice on 1 type of task may transfer to different tasks. 137 10th grade students, in 2 groups, from 2 advanced, 2 average, and 2 low-ability classes, were given 2 different types of vocabulary learning materials. Each group received 1 set of the same type of material/day for 15 days. A battery of ability tests was given at the beginning of the study, results of which were correlated with 2 criterion measures obtained on each of the 15 days. The 2 instructional methods showed different patterns of correlations with abilities over stages of practice and differential transfer. Evidence also shows differential learning-how-to-learn effects and an increasing trend of task-specific variance over practice trials. (French summary) (18 ref.)—*Journal abstract.*

7371. Rothkopf, Ernst Z. (Bell Telephone Lab., Murray Hill, N.J.) **The concept of mathemagenic activities.** *Review of Educational Research*, 1970(Jun), Vol. 40(3), 325-336.—Mathemagenic behaviors are those which give birth to learning. Mathemagenic activities take the form of 1 of 3 classes of activity: orientation, object acquisition, and translation and processing. Classes I and II are of a gross, molar character and are directly observable. Class III generally refers to reading.

The reading process is generally divided into translation, segmentation, and processing. Man's understanding of the human learning process is extremely embryonic. The mathemagenic emphasis should be on the student so that he may be encouraged to achieve instructional goals with his present resources.—P. D. Leedy.

7372. Samuels, S. Jay. (U. Minnesota) **Effects of pictures on learning to read, comprehension, and attitudes.** *Review of Educational Research*, 1970(Jun), Vol. 40(3), 397-407.—The bulk of the research findings on the effect of pictures on acquisition of a sight vocabulary was that pictures interfere with learning to read. There was an almost unanimous agreement that pictures, when used as adjuncts to the printed text, do not facilitate comprehension. But in the few studies done on attitudes, the consensus was that pictures can influence attitudes. Much research still needs to be done in the area of the effects of pictures on learning to read. (2 p. ref.)—P. D. Leedy.

Conditioning

7374. Dunham, Philip J. (Dalhousie U., Halifax, Nova Scotia, Canada) **Punishment: Method and theory.** *Psychological Review*, 1971(Jan), Vol. 78(1), 58-70.—Outlines a methodological framework for the analysis of punishment. The methodology, a multiple-response base-line procedure, serves 2 purposes. It raises a number of new questions about the properties of punishment, and permits the examination of some untested assumptions found in traditional punishment theory. Initial evidence obtained with the multiple-response methodology questions the validity of traditional theoretical assumptions and suggests 2 simple rules for predicting the properties of various punishment operations. (23 ref.)—*Journal abstract.*

7375. Gantt, W. Horsley. (Pavlovian Lab., Perry Point, Md.) **Mechanisms of behavior.** *Conditional Reflex*, 1970(Jul), Vol. 5(3), 171-179.—Reviews the major principles that have emerged from years of research at the Pavlovian Laboratory, 1st located at the Johns Hopkins Medical School and later at Perry Point. The principles identified were (a) the role of peripheral and central sites of action in the formation of CRs, (b) the conditionability of different physiologic systems leading to the concepts of schizokinesis, (c) developing interactions of stored foci of excitation leading to the concept of autokinesis, and (d) organ responsibility as a factor underlying the formation of CR. It is noted that this scientific approach remains inadequate to explain important aspects of information from the internal sense organs, i.e., a person's subjective life. (15 ref.)—P. McMillan.

7376. Hearst, Elliot; Besley, Serena, & Farthing, G. William. (U. Missouri) **Inhibition and the stimulus control of operant behavior.** *Journal of the Experimental Analysis of Behavior*, 1970(Nov), Vol. 14(3, Pt. 2), 373-409.—Reviews and evaluates a variety of methods, definitions, and theoretical notions that have been used in the study of inhibitory stimulus control. Preliminary data from several new operant methods are also described. It is proposed that future workers distinguish clearly between 2 forms of inhibitory control: (a) the learned power of a specific stimulus to reduce

behavior, and (b) a dimensional effect, in which responding increases as values progressively more distant from the value of that specific stimulus along some dimension are presented (generalization gradient). Conclusions from several important recent studies are shown to be strongly dependent on the individual Es criterion for deciding when a stimulus is inhibitory. (135 ref.)—*Journal abstract*.

7378. O'Gorman, J. G. (U. Queensland, St. Lucia, Brisbane, Australia) **Overextinction of the orienting reaction.** *Conditional Reflex*, 1970(Jan), Vol. 5(1), 27-35.—Examined E. N. Sokolov's report of return of the orienting reaction (OR) to repeated stimulus presentations following habituation in 18 male undergraduates using the GSR component of the OR and an auditory stimulus of 60-db intensity and 1000 cps. Both group and individual S data analysis indicate a return of the OR which habituated quickly. The number of stimulus presentations to the OR return point showed an inverse relationship to rate of initial OR habituation for individual Ss. (25 ref.)—*Journal abstract*.

7379. Staddon, J. E. & Simmelhag, Virginia L. (Duke U.) **The "supersitiation" experiment: A reexamination of its implications for the principles of adaptive behavior.** *Psychological Review*, 1970(Jan), Vol. 78(1), 3-43.—Replication and extension of Skinner's "supersitiation" experiment showed the development of 2 kinds of behavior at asymptote: (a) interim activities, related to adjunctive behavior, which occurred just after food delivery; and (b) the terminal response, a discriminated operant, which occurred toward the end of the interval and continued until food delivery. These data suggest a view of operant conditioning (the terminal response) in terms of 2 sets of principles: principles of behavioral variation that describe the origins of behavior appropriate to a situation, in advance of reinforcement; and principles of reinforcement that describe the selective elimination of behavior so produced. This approach was supported by (a) an account of the parallels between the law of effect and evolution by means of natural selection; (b) its ability to elucidate persistent problems in learning, e.g., continuity vs. noncontinuity, variability associated with extinction, the relationship between classical and instrumental conditioning, the controversy between behaviorist and cognitive approaches to learning; and (c) its ability to deal with a number of recent anomalies in the learning literature (instinctive drift, auto-shaping, and auto-maintenance). The interim activities are interpreted in terms of interactions among motivational systems, and this view is supported by a review of the literature on adjunctive behavior and by comparison with similar phenomena in ethology (displacement, redirection, and vacuum activities). The proposed theoretical scheme represents a shift away from hypothetical laws of learning toward an interpretation of behavioral change in terms of interaction and competition among tendencies to action according to principles evolved in phylogeny. 7380. Suboski, Milton D. & Khosla, Sudarshan. (Queen's U., Kingston, Ontario, Canada) **UCS intensity and instructional set in classical eyelid conditioning: Discrimination conditioning and signal-**

detection analysis. *Canadian Journal of Psychology*, 1969(Dec), Vol. 23(6), 389-401.—Conducted discrimination eyelid conditioning at 2 UCS intensities under inhibitory, neutral, and facilitatory instructional sets, in a experiment involving 144 undergraduates in 6 groups. Instructional set yielded receiver operating characteristic curves that were reasonably straight lines on a normal deviate plot. The tentative conclusion from signal-detection theory of an equal discriminability function across instructional sets was contrasted with 4 indices of discrimination, indicating significant but mutually contradictory changes in discrimination as a function of instructional set. Discrimination differences were produced by UCS intensity, particularly under the neutral instructions. (French summary) (16 ref.)—*Journal abstract*.

Verbal Learning

7383. Delprato, Dennis J. & Garskof, Bertram E. (Eastern Michigan U.) **Specific associative unlearning in the AB-CD paradigm.** *Canadian Journal of Psychology*, 1969(Dec), Vol. 23(6), 402-409.—Since previous experiments have yielded conflicting results as to whether or not specific associative unlearning occurs in the different stimuli-different responses (AB-CD) paradigm, 2 experiments were directed at this problem. In Exp. I, with 96 undergraduates who were naive to verbal learning experiments, the response-form class of AB-CD lists was varied; no evidence of associative unlearning was found in any condition. In Exp. II, with 100 Ss, significant unlearning was found with similar and identical stimuli in both lists, but not when nonsense syllables and numbers were used as stimuli in successive lists, or when minimally related nonsense syllables were used as stimulus terms in the 2 lists. J. B. McGovern's (see PA, Vol. 39:6813) analysis of unlearning was supported. (French summary)—*Journal abstract*.

7384. Keppel, Geoffrey & Zavortink, Bonnie. (U. California, Berkeley) **Retroactive inhibition for lists learned under interference conditions.** *Canadian Journal of Psychology*, 1969(Aug), Vol. 23(4), 245-253.—Determined whether a list of pairs acquired under conditions of interference is more susceptible to retroactive inhibition (RI) produced by additional interpolated interference than a list learned under noninterference conditions. The RI produced by groups differing in the type of prior learning administered, i.e., lists forming either an A-B, C-D, or an A-B, A-D relationship with the list being recalled, was compared. Results of modified-modified free recall test strongly support the susceptibility hypothesis. Data suggest (a) some evidence for proactive inhibition, but the demonstration was not reliable; and (b) that Ss who received nonspecific practice prior to their learning of 2 lists corresponding to an A-B, A-D paradigm showed less RI than Ss who had had no practice. (French summary)—*Journal abstract*.

7385. Lovelace, Eugene A. (U. Virginia) **Verbal-discrimination learning: Varied familiarization on correct and incorrect items.** *Canadian Journal of*

Psychology, 1969(Jun), Vol. 23(3), 227-232.—80 Ss in 4 groups were given 12 trials on a 30-pair verbal-discrimination (VD) list of very low-frequency words. The groups received different familiarization training prior to the VD task. Differential familiarization, given on correct and incorrect items, was initially beneficial, but more so when the correct item received the greater familiarization. More familiarization of incorrect than correct items resulted in a slower rate of improvement across trials than occurred when equal familiarization was given on correct and incorrect items, or when Ss received irrelevant familiarization. Equal familiarization of correct and incorrect items led to faster VD acquisition than irrelevant familiarization. (French summary)—*Journal abstract*.

Verbal Paired Associate Learning

7386. Butollo, W. H. (Graz U., Psychology Inst., Austria) *Untersuchung zur Invarianz der faktoriellem Determination von Lernverläufen*. [Investigation concerning the invariance of factor determination of learning processes.] *Psychologische Beiträge*, 1970, Vol. 12(1), 52-64.—Examines the problem of whether or not a change of factorial determination of responses takes place in the course of learning by means of the logistic test model. The comparison of parameters of repetitions in a paired associative learning experiment—estimated on the basis of the results of 1 group of fast and another of slow learning persons—resulted in extremely good conformity. This result could not be found by comparing individual parameters estimated on the basis of performances at different stages of a learning task. The position of interpolated list and test trials with respect to the original list is also discussed.—*English summary*.

7387. Chuang, Chong-jen. [Effects of associative strength and grade level in verbal paired-associate learning.] *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 121-124.

7388. Jacobus, Kenneth A. & Love, Craig T. (U. Kentucky) A further test of Johnson's "chunk-code" notion. *Journal of Psychology*, 1971(Jan), Vol. 77(1), 33-37.—Tested a response coding model by N. F. Johnson using a retroactive inhibition technique. 20 undergraduates learned 2 paired-associate (PA) lists. In each list the stimuli were single digits and each response contained 3 consonants. Each PA in original learning list was nearly identical to a PA in the interpolated learning list. As predicted, Ss produced more complete errors and errors on the middle response letters than did 20 controls.—*Author abstract*.

7389. McCormack, P. D., Clemence, G. D., & Moore, T. E. (Carleton U., Ottawa, Ontario, Canada) Monitoring eye movements under conditions of associative matching, response production, and stimulus and response production. *Canadian Journal of Psychology*, 1969(Apr), Vol. 23(2), 147-155.—Monitored eye movements in each of 3 studies with 20, 19, and 18 undergraduates, respectively, while Ss were given 8 study trials on a 7-item paired-associate list. Ss were then subjected to a single test trial of associative matching (Exp. I), response production (Exp. III) or stimulus and response production (Exp. IV). A 4th study with 42 Ss, (Exp. II), without eye movement monitoring, involved 3 groups of Ss given either 2, 4, or 6 study trials followed by a single test trial of associative matching. Results, with the exception of Exp. I, were generally

consistent with a 2-stage notion of verbal paired-associate learning. (French summary)—*Journal abstract*.

7390. Park, Tschang-Zin & Metzger, Wolfgang. (U. Münster, Psychology Inst., W. Germany) *Die Rolle des Zusammenpassens im assoziativen Lernen bei semantischer Sättigung*. [The role of fitting in associative learning and the significance of semantic satiation.] *Psychologische Beiträge*, 1970, Vol. 12(1), 115-126.—Investigated the effect of satiation upon fitting in paired associative learning. 8 pairs of a Korean adjective were used as the stimulus term, and a German word (a translation of the adjective) as the response term. In 4 of them the meaning of the German word fitted well with the sound of the Korean adjective, but less well in the other 4 pairs. Prior to anticipation learning of the pairs, an experimental group repeated the pairs rapidly, each stimulus term together with its response term. A control group was satiated with 8 other pairs of nouns not used in learning. It was found that (a) in the overall effect satiation procedure reduced the rate of learning; (b) fitting was a significant factor, the well fitting pairs being learned and recovering from satiation more rapidly than the less fitting ones. Results are interpreted in terms of organization theory. (16 ref.)—*English summary*.

7396. Yuille, John C., Paivio, Allan, & Lambert, Wallace E. (U. British Columbia, Vancouver, Canada) *Noun and adjective imagery and order in paired-associate learning by French and English subjects*. *Canadian Journal of Psychology*, 1969(Dec), Vol. 23(6), 459-466.—Varied rated noun imagery (I), rated adjective I, and noun-adjective order in a paired-associate (PA) learning task. 98 10th graders learned 2 PA lists, 1 with noun-adjective (N-A) pairs and 1 with adjective-noun (A-N) pairs. Within each list rated I of both nouns and adjectives was varied factorially. Both English- and French-speaking Ss learned the lists in their own languages. Results support the predictions from an hypothesis based on mediating imagery. N-A recall was superior to A-N recall for all combinations of word I, except when nouns were low and adjectives high in I. In

the latter case, A-N recall was higher. This pattern was the same for both English- and French-speaking Ss. Results are interpreted as further evidence of the important role played by imagery in verbal learning. (French summary)—*Journal abstract*.

Reinforcement

7401. Baddeley, A. D., Hatter, J. E., Scott, Denise, & Snashall, Aileen. (U. Sussex, Brighton, England) **Memory and time of day.** *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 605-609.—38 Ss performed a memory task on 2 occasions, 1 in the morning and the other in the afternoon. The task comprised 2 components, 1 involved immediate recall of sequences of 9 digits, the other involved the repeated item technique devised by D. O. Hebb, in which 1 9-digit sequence is surreptitiously repeated, each repetition being separated by 2 nonrepeated sequences. Performance on the immediate memory task was better in the morning than the afternoon. The repeated item was recalled more accurately than nonrepeated items, but this effect was not influenced by time of day. An explanation in terms of the relationship between arousal and memory reported by L. J. Kleinsmith and S. Kaplan is suggested. (17 ref.)—*Journal abstract*.

7402. Chase, William G. (U. Wisconsin) **Parameters of visual and memory search.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 926.

7403. Coltheart, Max & Geffen, Gina. (U. Waterloo, Ontario, Canada) **Grammar and memory: I. Phonological similarity and proactive interference.** *Cognitive Psychology*, 1970(Aug), Vol. 1(3), 215-224.—3 2-phoneme nonsense syllables were presented on each of 5 trials of a memory experiment. The items presented on Trial 5 possessed a phonological feature absent from all items presented on earlier trials. Accuracy of recall declined monotonically through the 1st 4 trials and

improved considerably on the 5th trial, i.e., there was a buildup and release of proactive interference. These effects are discussed in terms of the view that the memory trace for a verbal item consists of an array of syntactic, semantic, and phonological features, the particular classes of features present in the trace depending upon the particular nature of the verbal material presented. (26 ref.)—*Journal abstract*.

7404. Eiles, Richard R. (Arizona State U.) **Effects of mediational and motivational instructions on forward and backward recall of concrete paired-associate nouns.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1534-1535.

7405. Fisher, Dennis F. (U.S. Army, Aberdeen Proving Ground, Md.) **Effects of delay interval on word recall and clustering.** *Journal of Psychology*, 1971(Jan), Vol. 77(1), 67-77.—Examined the effects of delay interval (1 hr., 2 hr., 5 hr., 24 hr., and 1 wk.) upon word recall and clustering. Results indicate that the amount recalled and number of clusters used decreased with increases in the delay interval. However, word frequency, degree of clustering and cluster size were unaffected. The effects of list type (random or categorized) and sorting technique (free or constrained) were also examined. Results indicate that learning the categorized list and using the free-sort technique leads to increases in amount recalled and clustering.—*Author abstract*.

7406. Gruneberg, Michael M., Colwill, S. J., Winrow, P., & Woods, R. W. (University Coll. of Swansea, Wales) **Acoustic confusion in long term memory: An extension of previous findings.** *Acta Psychologica, Amsterdam*, 1970(Aug), Vol. 32(4), 394-398.—Considers further evidence for the existence of acoustic confusion in long-term memory. 20 nonsense CVC trigrams were presented at a rate of 1 every 4 sec. to 25 undergraduates. After 2 successive presentations of this list there was a 10-12 hr. gap. Ss were then given a test list, which consisted of items acoustically related, acoustically unrelated, and identical to items on the presentation list and were asked to indicate which items appeared on the original presentation list. False positive inclusion errors occurred to a significantly greater degree among items acoustically related to items on the presentation list, indicating acoustic confusion in long-term memory.—*Journal abstract*.

7407. Howe, Michael J. (U. Alberta, Edmonton, Canada) **The psychology of human memory: Recent progress.** *Science Teacher*, 1970(Feb), Vol. 37(2), 15-18.—Investigates the concept of memory, identifying memory as: (a) a useful label denoting the function of certain cerebral mechanisms for encoding, retaining, and retrieving information; (b) a way of using "several characteristics of perceived materials... as a basis for coding and storage"; and (c) a process of categorical organization. Memory is affected by the complexity and meaningfulness of the information and by the person's frame of reference. Mnemonics is discussed as a useful means of organizing meaningless material. New material is meaningful when it can be integrated into or connected to the existing structure. A case of a man whose memory "operated on principles similar to those encountered in mnemonic devices" is presented.—G. Steele.

7408. Johnson, John T. & Sowles, Cathie N. (Memphis State U.) **Proactive and retroactive inhibition as a function of intelligence.** *American Journal*

of *Mental Deficiency*, 1970(Sep), Vol. 75(2), 130-134. —Examined proactive and retroactive interference as a function of intelligence. 20 Ss of similar CA were drawn from each of 3 levels of intelligence (60-80, 90-110, and 120-140). Each S learned an original list of 8 pairs of familiar nouns, an interpolated list, and then relearned the original list. In original learning, the low-IQ group took significantly longer to reach criterion than the average- and high-IQ groups, which did not differ. There were no differences between the groups in proactive interference, but some evidence was found to suggest relatively greater retroactive interference in the average-IQ group. It is concluded that little evidence was provided to support the theory of an inhibition deficit in retarded individuals. (15 ref.)—*Journal abstract*.

7411. Meyer, David E. (Bell Telephone Lab., Murray Hill, N.J.) **On the representation and retrieval of stored semantic information.** *Cognitive Psychology*, 1970(Aug), Vol. 1(3), 242-299.—RT was measured for true-false decisions about 2 kinds of logical assertions, "all S are P" and "some S are P." Set relations and sizes of the semantic categories S and P were varied. Decisions about "all S are P" were faster when S and P were disjoint than when S and P intersected. For S and P disjoint decision time increased if P-size increased. For S is a P-subset decision time increased if P-size increased and S-size decreased. These data permit rejection of 5 1-stage retrieval models (e.g., compare S-exemplar to P-exemplar, compare S-attributes to P-attributes, etc.). A 2-stage model is suggested: decide if S and P are related, then decide if S is a subset of P. Decisions about "some S are P" support the 2-stage model. For S and P disjoint decisions were as fast as for "all S are P," but if S intersected P then decisions about "some S are P" were faster. Data suggest Stage 1 involves self-terminating comparisons of name of "S" to name of categories intersecting "P." Subtracting decision time for "some S are P" from "all S are P" suggests that Stage 2 involves self-terminating comparisons of P-attributes to S-attributes. The models suggests that at least 2 types of information about semantic categories are stored in memory, name of the categories they intersect and representations of their attributes. It is suggested that stored category names are organized in an intersections file based on amount of category overlap (e.g., "substance" is more distant from "stone" than is "solid"). Accessing attributes of intersecting categories seems to require a prerequisite search of category names. (17 ref.)—H. W. Hamilton.

7413. Sardello, Robert J. & O'Shea, Michael. (Duquesne U.) **A descriptive study of the emphasis-congruence hypothesis in recall.** *Acta Psychologica, Amsterdam*, 1970(Aug), Vol. 32(4), 386-393.—G. D. Yonge and J. M. Sassenrath's (see PA, Vol. 44:9685) description of the experience of Ss who were required to

recall a list of verbal items as a test of the emphasis-congruence hypothesis in recall. An examination of such an explication furthers the position of Yonge and Sassenrath that in this task, Ss structure their experience relating their own personal histories to the structure of the task and materials. In addition, results indicate that when an E attempts to describe the meaning of an experimental experience he does so in light of his knowledge of all the experimental conditions. Deriving the descriptions from the Ss allows the experience to unfold in a manner more closely congruent with what an S experiences, which can then be dialogued with the E's theoretical stance.—*Journal abstract*.

Short Term & Immediate Memory

7417. Merikle, P. M. (U. Waterloo, Ontario, Canada) **Presentation rate and order of approximation to English as determinants of short-term memory.** *Canadian Journal of Psychology*, 1969(Jun), Vol. 23(3), 196-202.—Presented sequentially, to 30 undergraduates, 28 sequences of 10 letters representing 0- and 2nd-order approximations to English at presentation rates of 3 letters/sec, 2 letters/sec, and 1 letter/sec. Groups of 10 Ss received each rate of presentation. In agreement with previous studies, the increased time for input processing available at the slower presentation rates produced greater differentiation in the immediate recall of 0- and 2nd-order approximations. Additional analyses suggest that the increased differentiation was attributable to both a greater increase in the efficiency of processing order information and more rapid processing of individual letters in the 2nd-order approximations. (French summary)—*Journal abstract*.

7418. Miller, Laurence; Adams, William; Deffenbacher, Jerry, & Hall, Larry. (Western Washington State Coll.) **The effect of instructional set and intertrial activity on retention in a short-term memory task.** *Psychological Record*, 1970(Sum), Vol. 20(3), 373-384.—Investigated the effects of ITI activity and instructional set on recall of consonant trigram stimuli in a short-term memory task. 48 undergraduates either: (a) sat silently during the ITI, (b) overtly rehearsed the prior item during the ITI, (c) overtly rehearsed the prior item under a set that they were to recall all items, (d) were given the set and engaged in a neutral counting activity during the ITI, (e) counted during the ITI with no set. Overt rehearsal and set, singly and together, depressed recall over a 3- and 18-sec retention interval and largely eliminated differences in recall between the two intervals. Counting during the ITI depressed recall of the initial and middle items. It is suggested that Ss in a short-term memory experiment engage in task-related activity during the ITI.—*Journal abstract*.

7419. Waugh, Nancy C. (Harvard Medical School, Boston, Mass.) **Repetition as a possible source of "isolation" in free recall.** *Canadian Journal of Psy-*

chology, 1969(Aug), Vol. 23(4), 285-291.—Ss listened to lists in which 1 or more items were repeated in immediate succession to determine whether an item is better retained when it is embedded in a series of unique items, or of items repeated at longer lags, than when it occurs within a series of items that are also presented twice in a row. Data indicate that it is not. It is concluded that repetition does not normally function as a significant source of "isolation" in tests of free recall. (French summary)—*Journal abstract*.

THINKING

7420. Bratko, A. A., Volkov, P. P., Kochergin, A. N., & Tsaregorodtsev, G. I. *Modelirovanie psikhicheskoi deyatel'nosti*. [The modeling of psychic activity.] Moscow, USSR: Mysl', 1969. 384 p.—Considers (a) theoretical problems in modeling psychic activity; (b) modeling of the basic forms of psychic activity—cognitive processes, goal directed activity, personality parameters (emotions, motivation); and (c) modeling of various disorders of psychic activity (pathological processes, psychopathological syndromes).—I. D. London.

7422. Garner, W. R. & Felfoldy, Gary L. (Yale U.) **Integrity of stimulus dimensions in various types of information processing**. *Cognitive Psychology*, 1970(Aug), Vol. 1(3), 225-241.—7 experiments were run in which speed of sorting decks of stimulus cards was measured. Stimuli were constructed from 2 dichotomous dimensions, used either alone, correlated, or orthogonally. Sorting was always into 2 categories defined by the levels of 1 dimension. The experiments differed in the nature of the stimulus dimensions. Value and chroma of single Munsell chips and the horizontal and vertical positions of a dot gave results which show facilitation with correlated stimulus dimensions and interference with orthogonal dimensions. Such dimensions, which also produce a Euclidean metric in direct stimulus scaling, are termed integral. Value and chroma of separate Munsell chips, as well as size of circle and angle of diameter, gave results which show little or no facilitation or interference. Such dimensions, which also produce a city-block metric in direct stimulus scaling, are termed nonintegral. (22 ref.)—*Journal abstract*.

7426. Shor, Ronald E. (U. New Hampshire) **The processing of conceptual information on spatial directions from pictorial and linguistic symbols**. *Acta Psychologica*, Amsterdam, 1970(Aug), Vol. 32(4), 346-365.—Analyzed the processing of spatial information by

30 undergraduates when expressed in pictorial and linguistic (verbal) symbolic representations. Outline drawings of arrows pointing in the directions of up, down, right, and left were compounded with the word names for these directions printed within the arrows. A set of predictions were confirmed including: (a) that it takes more time to name the arrow directions than to read the words, and (b) that an interference phenomenon can be produced using mismatched spatial symbols similar to the color-word interference phenomenon of the Stroop test. A number of lines of further investigation are presented. (30 ref.)—*Journal abstract*.

7427. Wetherick, N. E. (U. Bradford, England) **On the representativeness of some experiments in cognition**. *Bulletin of the British Psychological Society*, 1970(Jul), Vol. 23(80), 213-214.—Critically examines the nature of tasks in some experiments in cognition. Differences in Ss' performance on "brain-twister" tasks vs. performance on tasks more representative of thinking or problem-solving required in everyday life are discussed.—V. S. Sexton.

Problem Solving

7428. Dewing, Kathleen & Battye, Gregory. (U. Western Australia, Nedlands) **Attention deployment and nonverbal fluency**. *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 214-218.—Examined the utilization of incidental cues in problem solving as a function of both nonverbal and verbal fluency, following the experimental procedure described by G. A. Mendelsohn and B. B. Griswold (see PA, Vol. 39:740 and Vol. 40:12919). 30 anagram problems were given to 91 undergraduates drawn from the upper and lower 25% on verbal and nonverbal fluency tests. Immediately before the anagram task, Ss learned a 25-word list, while another list was played on a tape recorder. 10 of the anagram solutions appeared in the memorized list (focal incidental cues) and 10 in the interference list (peripheral incidental cues). High scorers on the nonverbal fluency tests made significantly more use of the focal cues than low scorers. High scorers on the verbal tests also utilized more focal incidental cues than low scorers, but the difference between groups was not significant. Neither high nor low scorers utilized the peripheral cues. There was no difference between high and low groups in rote recall of the memorized list. Results provide at least partial support for a relationship between attention deployment and 1 important aspect of creativity, and indicate that the Mendelsohn findings of greater use of incidental verbal cues by high Remote Associates Test scorers was not a result of their higher vocabulary level. (25 ref.)—*Journal abstract*.

7429. Jones, Sheila. (University Coll., London, England) **Visual and verbal processes in problem-solving**. *Cognitive Psychology*, 1970(Aug), Vol. 1(3), 201-214.—Investigated the relationship between the spatial assignments used by Ss in solving linear syllogisms and the lexical marking of the comparative adjectives used in the premises. This relationship was used to test predictions from 2 different theories about the relative difficulty of various types of linear syllogism. One theory is based on "spatial paralogic," and the other concerns the deep structure analysis of language processing. The comparisons favored the latter theory. However, it is suggested that certain experimental conditions may have favored the use of verbal rather

than visual processes in problem solution.—*Journal abstract.*

Special means to direct this process is elaborated in the form of a set of cards with border perforations.—*I. D. London.*

Concepts

7431. Davis, J. Kent & Klausmeier, Herbert J. (Purdue U.) **Cognitive style and concept identification as a function of complexity and training procedures.** *Journal of Educational Psychology*, 1970(Dec), Vol. 61(6, Pt. 1), 423-430.—In 2 factorially designed experiments, 170 12th grade males learned a concept-identification task. Exp. I varied cognitive style (high, medium, and low analytic) and complexity (1, 3, or 5 bits of irrelevant information). As hypothesized, an S's cognitive style was found to influence his concept-identification performance. Ss identified as analytic on the Hidden Figures Test experienced little difficulty in identifying concepts, while low-analytic Ss experienced considerable difficulty. Ss falling in the middle of the Hidden Figures Test distribution performed at an intermediate level of performance. Also the hypothesized Cognitive Style \times Complexity interaction was not supported. Exp. II varied cognitive style (high and low analytic) and training conditions (verbalization and prompting). As in Exp. I, Ss identified as high analytic solved the concept-identification problem with greater ease than did the low-analytic Ss. Furthermore it was found that the prompt-only and the verbal-only training conditions resulted in significantly better concept identification than the no training control condition. (22 ref.)—*Journal abstract.*

7432. Kornreich, L. Berell. (U. Wisconsin, Milwaukee) **Training and transfer of a strategy for solving concept identification problems.** *Psychonomic Monograph Supplements*, 1970, Vol. 3(12), 129-135.—Assessed the effect of various training procedures on transfer performance in 5 experiments with 270 undergraduates. 111 Ss did not acquire a focusing strategy during practice phases, and were eliminated from the experiments at that point. It was found that, in terms of the number of problems solved, neither stimulus nor structural changes in the problems from training to transfer produced a decrement in performance. When a response change was required, however, an asymmetrical effect was found. This is explained in terms of an asymmetry in the response strategies acquired by the different groups. A structural analysis of the changes that did not produce decrements in performance reveal that the rules of operation for S were not changed, whereas when the rules were changed, a decrement did occur. Similarity in methodology and findings between this research and the classic work on learning sets is noted.—*Journal abstract.*

DECISION & CHOICE BEHAVIOR

7433. Audley, R. J. (University Coll., London, England) **Choosing.** *Bulletin of the British Psychological Society*, 1970(Jul), Vol. 23(80), 177-191.—Presents the

broad outlines of the psychology of choosing. Attention is also directed to important problems still requiring solution. It is stated that unless a thorough understanding of man's choice processes is developed, it will be impossible to develop a technology of decision-making adequate to cope with the growing complexity of modern environment.—*V. S. Sexton.*

7434. Getty, David J. (U. Pennsylvania) **The choice partial reinforcement effect: Experiments and a stochastic learning model.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1563-1564.

7435. Rodrigues, Aroldo. (Pontifical Catholic U., Rio de Janeiro, Brazil) **Motivational forces of cognitive dissonance and psychological reactance.** *International Journal of Psychology*, 1970, Vol. 5(2), 89-98.—40 high school Ss, voluntarily participating in a purported essay-writing contest, experienced choice with partial restriction of freedom, no choice with partial restriction of freedom, or no choice and no restriction of freedom with respect to essay topics. Results support what dissonance theory would predict: ratings of attraction of chosen and rejected alternatives spread apart following the decision process and show a tendency to increase the chosen or imposed rating of attraction. Under conditions of no choice and partial restriction of freedom, results yield some support for psychological reactance, conceived as a motivational state directed toward re-establishing free behaviors eliminated or threatened with elimination. (French abstract)—*S. E. Gavin.*

PHYSIOLOGICAL PSYCHOLOGY

7436. Avakyan, N. G. (House of Sanitary Education, Erevan, USSR) **K kritike fiziologicheskogo idealizma i agnostitsizma.** [A criticism of physiological idealism and agnosticism.] *Eksperimental'nyy i Klinikaniy Bzhshkovi'yan Handes*, 1970, Vol. 10(1), 100-106.—Presents a historical survey of physiological idealism and agnosticism, followed by a discussion of N. E. Vvedenski's theory of parabiosis which is held to undermine the basis of such views. As regards the idealistic formulation, "all or none," it can be said that it is not a general biological law, but represents a special case of a "general parabiosis reaction."—*I. D. London.*

7437. Bindra, Dalbir. (McGill U., Montreal, Quebec, Canada) **The interrelated mechanisms of reinforcement and motivation, and the nature of their influence on response.** *Nebraska Symposium on Motivation*, 1969, Vol. 17, 1-33.—Examined 3 groups of questions concerning reinforcement, motivation, and response determination in order to establish the hypothesis that "the principle of reinforcement is a special case of the more fundamental principle of motivation." Recent studies on intracranial stimulation suggest that the same neural systems (brain sites) underlie reinforcement and motivation. "Central motive states" are created by both reinforcing events and motivating events to selectively influence subsequent behavior. Comments by E. L. Wike follow. (47 ref.)—*J. M. Roberts.*

Lenin and the development of physiology in the USSR.] *Fiziologicheskii Zhurnal SSSR*, 1970(Apr), Vol. 56(4), 457-465.—Discusses (a) the influence of Lenin's work, *Materialism and Empiriocriticism* (1909), on later developments in Russian and Soviet physiology, and (b) the physiolog-

ically related views of the various authors cited in that work. The greatest influence has been in the physiology of higher nervous activity and that of the sensory organs.—*I. D. London.*

7439. Ferrari, Eugenio. (U. Messina, Clinic for Nervous & Mental Diseases, Italy) **Fattori biologici dell'aggressività.** [Biological factors of aggressiveness.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1968(Sep), Vol. 29(5-6), 460-485.—Reviews the relationships between aggressive behavior and endogenous endocrine glands, thyroid, sexual hormones, testosterone and progesterone, and other hormones. Exogenous factors like ecology, nutrition, and pharmacological functions are also reviewed.—*L. L'Abate.*

7440. Furedy, John J. (U. Toronto, Ontario, Canada) **Electrodermal and plethysmographic OR components: Repetition of and change from USC-CS trials with surrogate UCS.** *Canadian Journal of Psychology*, 1969(Apr), Vol. 23(2), 127-135.—For 40 undergraduates a tone and a light were repeatedly paired (P) in the same order (e.g., tone-light) for 15 trials, after which the 2nd member of the pair (e.g., light) was presented alone as the change trial. For another 40 Ss the repetition consisted of 15 single (S) tone (or light) presentations followed by the light (or tone) as the change trial. The duration of both stimuli was .3 sec., the interstimulus interval (on P trials) was .75 sec., and the mean ITI approximated 45 sec. The GSR and digital-blood-volume-pulse change (VPC) were recorded. The GSR habituated reliable and at the same rate to both repeated patterns over Trials 1-15, but the VPC did not habituate to either pattern. Change from both S and P repetition produced response increases, but the increase under the P condition was not so pronounced as to inspire confidence in explanations of UCS-CS conditioning in terms of orienting reaction reinstatement to change. (French summary)—*Journal abstract.*

7441. Garg, Mithlesh. (K.L.D.A.V. Coll., Meerut U., Roorki, India) **Combined effect of drug and drive on the consolidation process.** *Psychopharmacologia*, 1970, Vol. 18(2), 172-179.—Maudslay strain rats were trained in the Hebb-William's maze under 3 levels of food deprivation, 22, 25, and 7 h (drives) for 10 consecutive days. After each daily trial the experimental Ss of the 3 drives were injected with 1 mg/kg dose of picrotoxin, and controls were administered distilled water. Picrotoxin increased the efficiency of learning at all levels of drive, and higher drive levels resulted in greater performance. The reactive strain performed better in the maze learning than the nonreactive.—*Journal abstract.*

7442. Germana, Joseph. (Virginia Polytechnic Inst.) **Biological differentiation: Implications for models of nervous control.** *Conditional Reflex*, 1970(Apr), Vol. 5(2), 119-125.—Existing models of physiologic and behavioral function and the nervous control of these events may bear reexamination on the basis of evidence for a process of differentiation in transduction processes. Biological differentiation provides a basic and intrinsic mechanism through which single neural, receptor, and effector mechanisms can modify the nature of their responses. (22 ref.)—*Journal abstract.*

7443. Grigor'ev, N. R. (Hygiene-Medical Inst., Leningrad, USSR) **Labil'nost' propriotseptivnoi resuletsionoi dugi razlichnykh myshts v normal'nykh usloviyakh i pri izmenenii funktsional'noi nagruzki.** [Lability of the proprioceptive reflex arc of different muscles under normal conditions and during alteration of functional work load.] *Fiziologicheskii Zhurnal SSSR*,

1969(Nov), Vol. 55(11), 1348-1353.—Used prepared rabbits with intact CNS to determine the lability of the proprioceptive reflex arc of several muscles of the ankle joint in the hind legs. Each muscle was put under constant tension (150-200 g) and subjected to rhythmic mechanical distension through a vibrator (amplitude: .6-1.5 mm.; gradually increasing frequency of 20 to 100-160 cps). The lability involved in postural and phasic activity, is not uniform and is a function of the concrete conditions of muscle functioning. An isotonic regime of activity led to a decrease in the lability of the proprioceptive reflex arcs—a decrease which was expressed in muscles carrying out phasic contractions. A short-term increase in the functional work load increased the lability of the muscles' proprioceptive reflex arcs. The lability of the proprioceptive reflex arc of the phasic and tonic muscles is not strictly constant and may increase or decrease, depending on the new form of activity. The changes in lability are important for the adaptation of the neuromuscular system to new conditions of activity. (English summary) (15 ref.)—*I. D. London*

7444. Hicks, Ronald G. (Plymouth State Home & Training School, Sensory Assessment Lab., Northville, Mich.) **Experimenter effects on the physiological experiment.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 10-17.—Determines the effects of S expectancies as inadvertently influenced by the investigator in a perceptual-physiological experiment, even to the point where the principal investigator's choice of an experimentally naive assistant still reflects his expectancies. 18 adult males were randomly assigned to 1 of 3 different naive Es: (a) an automated procedure, (b) a reserved female, and (c) a sociable female. All Ss were tachistoscopically presented with 76 4-letter words which included both socially acceptable and taboo words. The Ss' physiological responses were monitored during the entire experiment. The words were grouped according to their social desirability and were analyzed by a trend analysis of variance. Results demonstrate that both the Ss' physiological responsivity and his reporting of socially acceptable and taboo words are dependent upon the E.—*Journal abstract.*

7445. Khavkina, N. N. & Zharova, L. T. (Leningrad State U., USSR) **K voprosu o vzaimodeistvii simmetrichnykh dvigatel'nykh tsentrov v usloviyakh posledovatel'nykh innervatsii v protsesse uprazhneniya.** [On the interaction of symmetrical motor centers under conditions of successive innervation in the process of exercise.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1358-1363.—9 Ss participated in an EMG and ergographic study to determine the significance of the nonequivalence of the symmetrical motor centers during their interaction under conditions of "successive innervation" in the process of establishing a simple motor act. 3 variants of the experiment were utilized with the same finding: in spite of the structural simplicity of the motor act (flexing movement of the hand to the point of fatigue), its formation is dependent on functional asymmetry—right-handedness. With artificial fixation on the dominant role of the left hand or the equality of both hands, a negative result ensued. In Variant I, with the right hand dominant, the influence of successive periods of sinistral activity (trace proprioceptive stimulation) on the course of formation of the dextral motor act was studied. In Variant II manual roles were reversed. And in Variant III equal attention was given to both hands.—*I. D. London.*

7446. Laborit, H., Baron, C., & Weber, B. (Boucicaut

Hosp., Paris, France) **Traitement du choc hémorragique expérimental dit "irréversible": Rôle des groupes SH et de la restauration des réserves intraparticulaires en catécholamines: III. Etude stéréotaxique des stimulations cérébrales.** [The treatment of experimental hemorrhagic shock called "irreversible": The role of SH groups and of the restoration of intraparticulate reserves of catecholamines: III. Stereotaxic investigation of cerebral stimulation.] *Agressologie*, 1969(May), Vol. 10(3), 205-215.—Presents a stereotaxic investigation of the effects of electrical stimulation on various regions of the brain. Estimations were gathered prior to and after hemorrhagic shock and after treatment with iv administration of tyrosine, chlorpromazine, and SH groups (dichlorhydrate of methyl-isothiouril-4-thiazole). Results show that hemorrhagic shock effects the following in the rabbit: (a) suppression of cortical desynchronization, (b) suppression of afterdischarges which follow stimulation of the dorsal hippocampus, and (c) suppression of induced hypertension. The iv administration of tyrosine, especially in combination with chlorpromazine, is seen to restore (within 30-60 min.) normal reactions to induced electrical stimulation. In conclusion, the use of tyrosine as an antidepressant (alone or in combination with tranquilizers) is discussed. (German, English, & Spanish summaries)—*P. R. Shibelski.*

C.** (Radcliffe Infirmary, Oxford, England) **A note on Kimball's paper "Models for the estimation of competing risks from grouped data."** *Biometrics*, 1970(Sep), Vol. 26(3), 579-581.—With several competing causes of death, 2 models have been used to calculate the probability of death from a given cause, in a specified time interval, when a competing cause is eliminated. The apparently anomalous results from the commonly used model are due to the continuous nature of the model, which makes it more biologically reasonable than the model proposed by Kimball.—*R. L. McCornack.*

7453. **Randolph, Mary.** (National Inst. of Mental Health, Lab. of Psychology, Bethesda, Md.) **Role of light and circadian rhythms in the nocturnal behavior of Galago crassicaudatus.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 115-122.—Designed a series of 5 experiments to examine the nocturnal behavior of 6 wild-caught male-female pairs of Galago crassicaudatus in terms of the concepts of light-related behavior from the psychological literature and concepts of circadian rhythms from the biological literature. Results suggest that an adequate characterization of nocturnal behavior in the galago must consider illumination preferences, the direct consequences of light on ongoing behavior, and circadian variations in activity level. Results show that although each of these factors has a measurable effect on behavior, the nocturnal pattern is dependent on complex interactions between all factors. The immediate effects of light intensity are influenced by prevailing activity level; this level, in turn, is dependent upon where the S is within its daily behavioral cycle; and the cycle itself is synchronized with a circadian illumination schedule. Wright, Merle L. **The hypnotic state and related physiological effects.** *Journal of the American Society of Psychosomatic Dentistry & Medicine*, 1970, Vol. 17(2), 46-55.—Some physiological effects related to hypnosis are indicated. They are approached by recording subjective phenomena as reported by the patient by enumerating observable phenomena and by including measurable phenomena.—M. V. Kline.

7461. Zimkin, N. V. (Ed.) **Fiziologicheskoe obosnovanie trenirovki.** [The physiological foundations of training.] Moscow, USSR: Fizkul'tura i Sport, 1969. 192 p.—Presents a collection of 34 articles, constituting Issue 2 of *Problemy Fiziologii Sporta* [Problems in the Physiology of Athletics]. A number of the articles report on the findings of research on the nervous system, analyzers, and the motor apparatus under conditions simulating athletic training and performance.—I. D. London.

NEUROLOGY

7462. Asratyan, E. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **K mekhanizmu obrazovaniya uslovnogo refleksa.** [On the mechanism of conditioned response formation.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 741-751.—Presents a summarized exposition of the

factual data, developed out of the research on the mechanism of CR formation, as well as theorization on the subject.—I. D. London.

7463. Belenkov, N. Yu. (Kirov Medical Inst., Gorki, USSR) **Starye i novye problemy vzaimootnosheni kory i podkorkovykh obrazovani.** [Old and new problems of the interrelationships between the cortex and subcortical formations.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 752-767.—Presents an analysis based on the data of the literature and the author's own research on the morphophysiological organization of higher nervous activity. Injury to any part of a cerebral system leads for a certain time to cessation of its function. The system as a whole is rendered inactive. Not only does exclusion of the cortex and its parts disturb the unity of the system, but exclusion also of the subcortical centers leads to various kinds of disturbance. Cessation or change of function of 1 system is reflected in the activity of other cerebral systems. However, the changes in its activity are not irreversible. The reliability of a system is attributed to the highly developed properties of the brain with respect to transformation of its morphophysiological organization, leading to considerable compensation of excluded parts.—I. D. London.

7464. Beshalova, M. A. (Leningrad State U., USSR) **Sfingozin tserebrozidov golovno mozga.** [The sphingosine of the brain cerebroside.] *Nervnaya Sistema*, 1968, No. 9, 41-46.—2 wk. to 6 mo. old rats were used to study the rate of the metabolism of the sphingosine (sphingomyelin) and cerebroside of the brain, utilizing radioactive acetate (acetate-2-¹⁴C). The concentration of cerebroside in the brain increased with age. The rate of incorporation of radioactive carbon into cerebroside and sphingosine of the brain was maximum 2 hr. after administration of the acetate. The rate of synthesis of sphingosine exceeded that of the cerebroside.—I. D. London.

7465. Bodrova, N. V. & Krayukhin, B. V. Akademik Aleksandr Vasil'evich Leontovich. [Academician Aleksandr Vasil'evich Leontovich.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1425-1426.—Recalls the life and work of A. V. Leontovich, noted for his contributions to neurophysiology and neurohistology, on the occasion of his 100th birthday.—I. D. London.

7466. Bogach, P. G. & Karevina, T. G. **O roli bludnogo tela i ego vzaimootnosheni s gipotalamicheskim tsentrom pit'ya v regulatsii potrebleniya vody u sobak.** [On the role of globus pallidus and its interrelationships with the hypothalamic drinking center in regulation of water intake in dogs.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 15-21.—Electrical stimulation of the hypothalamic drinking center and of the pallidal region was employed in Ss with stomach fistulae along with electrolytic extirpation of the pallidal structures. Electrical stimulation of globus pallidus caused almost the same increase in water intake as stimulation of the hypothalamic drinking center. However, stimulation of globus pallidus did not elicit water intake in Ss not suffering water deprivation, whereas stimulation of the hypothalamic drinking center did this. Simultaneous stimulation of globus pallidus and the midlateral hypothalamus produced a greater increase in drinking excitability than stimulation of globus pallidus alone. Bilateral extirpation of the pallidal structures led to a great decrease in drinking excitability, but complete adipsia was not observed. Stimulation of

the hypothalamic drinking center in this condition produced an increase in water intake, but this increase was significantly less than that in the case of intact pallidal structures. Injection of novocaine into the pallidal region produced a transient decrease in water intake. Stimulation of the midlateral hypothalamus after novocainization of the pallidal structures produced a great increase in drinking excitability. These data provide evidence for the importance of the pallidal region in regulating water consumption. However, the basic mechanisms for regulating water consumption are localized in the hypothalamus which, together with other cerebral structures, regulates water consumption.—*I. D. London.*

7467. Denis'evskii, A. V. & Karpezo, N. A. (Kiev U., USSR) *Vliyaniye glubokogo okhlazhdeniya na neurosekretnuyu sistemu i gipofizarno-tireoidnyi kompleks zarodysha kurltsy.* [Influence of deep cooling on the neurosecretory system and hypophyseal-thyroid complex of the chick embryo.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 106-116.—41 17-day chick embryos were used to study the neurosecretory system, adeno-hypophysis, and thyroid gland after cooling to 30° and 16° C. The cells of the hypothalamic supraoptical nucleus lost their activity after cooling, the average diameter of the cellular nucleus diminished and neurosecretory granules accumulated in the supraoptico-hypophyseal tract and partly in the neurohypophysis. The cells of the paraventricular nucleus did not undergo discernible changes, and the average diameter of the cellular nucleus remained the same. In the adeno-hypophysis, activation of the thyrotrophic cells could be observed. After lowering the temperature to 30° C, there was an accumulation of secretory granules in these cells. After lowering to 16° C, their mass removal. The functional activity of the thyroid gland increased immediately after cooling. The character of the observed changes indicated the high degree of differentiation within the hypophyseal-thyroid system in the 17-day chick embryo. The state of the paraventricular nucleus after cooling demonstrated its lower level of reactivity as compared to that of the supraoptic nucleus, eminentia mediana, and neurohypophysis.—*I. D. London.*

7468. Dimond, Stuart. (University Coll., Cardiff, Wales) *Hemispheric refractoriness and control of reaction time.* *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 610-617.—Describes 2 experiments with 10 right-handed undergraduates which assess the relative efficiency of the hemispheres and their relationship in performance on complex RT tasks. A divided visual field method was used to direct signals to the temporal or nasal retina of each eye thus passing information to separate hemispheres. A comparison of the separate RTs was used to assess the relative efficiency of each hemisphere but significant differences were not observed. This suggests that each may be the equal of the other in organizing simple responses. A method was used to examine more complex RT by presenting the S with 2 simultaneous signals for response. When pairs of signals are directed to separate hemispheres, RTs are at their lowest value. When signals are directed to separate hemispheres through the same eye, a significant increase in RT occurs. A source of mutual interference appears to exist at the level of the eye. RTs are extended to their greatest value, however, when both signals are directed to the same hemisphere. This block to function has been described as hemispheric re-

fractoriness and is different for the 2 hemispheres. While each show a distinct block to function the extent of this is greater in the right or minor hemisphere than it is in the left or major hemisphere.—*Journal abstract.*

7469. Flerov, M. A. (Leningrad State U., USSR) *Nekotorye dannye o glitseridakh golovnogo mozga.* [Some data on glycerides of the brain.] *Nervnaya Sistema*, 1968, No. 9, 53-57.—Presents a chromatographic study of the concentration and rate of metabolism of the mono-, di-, and triglycerides in the rat brain. Concentration increased in the sequence given. 15-30 min. after administration of acetate-2-C¹⁴, the metabolic rate ("specific activity") of these glycerides fell off in the direction of the sequence: di-, mono-, triglycerides.—*I. D. London.*

7470. Golikov, N. V. (Leningrad State U., USSR) *Teoriya otrazheniya i mekhanizmy nervnoi deyatel'nosti.* [Reflection theory and the mechanisms of nervous activity.] *Fiziologicheskii Zhurnal SSSR*, 1970(Apr), Vol. 56(4), 466-473.—Presents an analysis of the mechanisms of nervous activity, seen as fundamentally involved in "reflection processes" mirroring an objective world. "Only on the gnoseological plane does the opposition of matter and consciousness have an absolute significance."—*I. D. London.*

7471. Kosenko, A. F. (Kiev U., USSR) *O roli gipotalamusa v patogeneze yazvennoi bolezni zheludka i dvenadtsatipervoi kishki.* [On the role of the hypothalamus in the pathogenesis of gastric and duodenal ulcers.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 39-46.—Results from using dogs indicate that a number of factors operate to affect the pathogenesis of gastric ulcers resulting from lesion and stimulation of the hypothalamus. Lesion of tuber cinereum and stimulation of the anterior hypothalamus brought on the secretion of actively acid gastric juice with the subsequent development of gastric erosion and ulcers. It is assumed that lesion of tuber cinereum or stimulation of the anterior hypothalamus disturbs the usual balance between the sympathetic and parasympathetic centers of the hypothalamus, due to an acute decline in the function of the latter on stimulation.—*I. D. London.*

7472. Kots, Ya. M. (Central Inst. of Physical Culture, Moscow, USSR) *Issledovanie uchastiya gamma-petli v organizatsii proizvol'nogo dvizheniya.* [Study of the participation of the gamma-loop in the organization of voluntary movement.] *Zhurnal Vyssshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 862-869.—Used 8 Ss to study (a) the role of the gamma system in the voluntary movement of lifting of heel from floor, and (b) the participation of the gamma loop in the origin of the spinal priming effect in voluntary activation of the alpha motoneurons. The temporal course of change in reflex excitability of the spinal motoneurons throughout the latent period of voluntary movement under normal conditions was compared with disruption of gamma-loop function by means of ischemic ligaturing of the limb. The latent period for the appearance of motor myograms under normal conditions was also compared with ischemic "deafferentiation," in order to determine gamma loop participation in voluntary activation of the alpha motoneurons. The reflex H-response and the peripheral M-response of the gastrocnemius muscles were recorded. Ischemic ligaturing of the lower extremity led to the early block of conduction in the low threshold afferent fibers of the H reflex, with relative retention of conduction along the efferent motor fibers. The steady

growth of reflex excitability of the spinal motoneurons throughout the last 60 msec. of the latent period of voluntary movement was not disturbed by ischemic "deafferentation." The latent period for the appearance of the myogram of voluntary movement in ischemic "deafferentation" is not different from what is observed under normal conditions. Gamma-loop involvement is not necessary for initial voluntary activation of the spinal alpha motoneurons.—*I. D. London.*

7473. Kováč, Damián & Horkovič, Gabriel. (Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Laterálna preferencia: Súčasný stav a perspektívy.** [Lateral preference: Present day state and perspectives.] *Psychologica: Sborník Filozofickej Fakulty, U. Komenského, Bratislava*, 1967, Vol. 18(7), 19-59.—Studied the most important aspects of lateral phenomena from an interdisciplinary scientific viewpoint emphasizing psychology and neurophysiology. Synthesis lead to formulation of hypotheses concerning (a) competitive character of pair functions as a phylogenetic and ontogenetic agent, (b) progressive status of lateral preference in the hierarchy of functions, (c) integrating activity of the dominant functional region, and (d) functional character of the acquisition of lateral dominance. (Russian & German summaries) (65 ref.)—*English summary.*

7474. Makarov, P. O., Lonskii, A. V., & Tuchkov, B. S. (Leningrad State U., USSR) **Vliyaniye ul'trazvuka na elektronnomikroskopicheskuyu kartinu nerva lyagushki.** [Influence of ultrasound on the electron microscopic picture of frog nerve.] *Nervnaya Sistema*, 1968, No. 9, 127-132.—Frog sciatic nerves were subjected to ultrasonic action in a study showing that, even with maximal elimination of the heat factor, when ultrasonic action produces slight physiological changes, neural ultrastructure also undergoes change.—*I. D. London.*

7475. Makashvili, G. A. **O nekotorykh strukturnykh osobennostyakh neironov otdel'nykh sloev vos'mogo i chetvertogo polei kory bol'shikh polusharii golovnogo mozga cheloveka v protsesse stareniya.** [On some structural features of the neurons in the different layers of the eighth and fourth fields of the human cerebral cortex in the process of aging.] Tbilisi, USSR: Sabchota Sakartvelo, 1969. 52 p.—Presents the results of biometric, cytochemical, and cytophotometric studies of 45 cadavers of 31-105 yr. olds, 4 hr. after sudden death from severe injuries. The morphological changes to be observed in the neurons of several parts of the cerebral cortex in the process of aging are delineated.—*I. D. London.*

7476. Meyer, John R. (U. Iowa) **Modification of nerve conduction by selected environmental factors.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1605-1606.

7477. Popovichenko, N. V. & Kozitskaya, L. S. (Bogomolets Inst. of Physiology, Kiev, USSR) **Sutochnyi ritm aktivnosti neurosekretornykh elementov gipotalamo-gipofizarnoi neurosekretornoï sistemy u krysa-samtsov s audigennoi "reflektornoi" epilepsiei.** [Diurnal rhythm of the activity of the neurosecretory elements of the hypothalamo-hypophyseal neurosecretory system in male rats with audiogenic "reflex" epilepsy.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 96-105.—Studied cerebral materials derived from 28 Ss. A diurnal rhythm was discerned in the activity of the hypothalamo-hypo-

physeal neurosecretory system. However, differences in the rhythm of activity were detected for the supraoptic and paraventricular nuclei. During the day, processes involving the synthesis and increased outflow of neurosecretory substances predominated in the former nucleus. In the latter, processes involving their storage predominated, while those involving their secretion were inhibited. In the neurosecretory cells of the supraoptic nucleus, the processes of synthesis and secretion were moderately expressed in the morning hours; in the evening hours their intensity abated somewhat. In the neurosecretory cells of the paraventricular nucleus the processes of secretion were more strongly expressed in the morning; in the evening, those of synthesis and storage of the neurosecretory substances. It is suggested that, in the evening hours, there occurs in the eminentia mediana the greatest activation of the processes secreting the neurohormones which are contained in the neurosecretory substances; while in the morning and especially during the day these processes are inhibited.—*I. D. London.*

7478. Prokhorova, M. I. (Leningrad State U., USSR) **Energeticheskii obmen v golovnom mozga i nervnyi impuls.** [The nerve impulse and energy exchange in the brain.] *Nervnaya Sistema*, 1968, No. 9, 13-23.—Presents data on the energy-bearing substances of the brain, and the connection of Na-ionic transport with energy exchange of the brain and the specific adenosine triphosphatase (ATP-ase) involved, in order to determine to what degree energy formed in the brain is utilized for the nerve impulse and especially in the restoration period. Among the findings: The nonuniform distribution of Na- and K-ions in nerve tissue is in a state of "militant readiness," exhibiting a dynamic equilibrium which can be instantly changed and as quickly restored.—*I. D. London.*

7479. Rüdiger, W. & Seyer, Gisela. (Humboldt U., Berlin, E. Germany) **Thermosensitive bar-pressing behavior of the rat with unilateral lesion in the hypothalamus and during cortical spreading depression.** *Acta Biologica Experimentalis*, 1968, Vol. 28(4), 375-382.—Investigated the influence of cortical spreading depression (SD) on the excitability of hypothalamic areas in 10 male Wistar rats with unilateral lesions in the area preoptica and the nucleus lateralis anterior. An instrumental (operant) CS, i.e., thermal reward (radiant heat) in a cold environment, was used to produce an instrumental CR (lever pressing for radiant heat) which could easily be quantitatively evaluated. When the cortical SD was produced in the hemisphere contralateral to the lesion in the hypothalamus, the lever pressing rates became higher than in the other possible combinations of cortical SD with hypothalamic or extrahypothalamic lesions. Results are discussed in terms of the drive theory of instrumental responding. (17 ref.)—*Journal summary.*

7480. Samsonova, V. G., Chilingaryan, L. I., & Mosidze, V. M. **Mezhdunarodnyi kongress po vysshei nervnoi deyatel'nosti.** [1st International Congress on Higher Nervous Activity.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 900-904.—Presents an account of the 1968 Congress held in Milan, Italy. Summaries are provided of a number of the papers which were mainly devoted to the "physiology and pathology of the human brain" (basic principles, nervous and psychiatric disorders, psychopharmacology, psychotherapy).—*I. D. London.*

7481. Sheliya, L. G. **Prikladnaya anatomiya nervov venechnykh arterii.** [Applied anatomy of the nerves of the coronary arteries.] Tbilisi, USSR: Metsniereba, 1969. 108 p.—Presents the results of studies on the origins, routes, and topography of the nerves forming the coronal plexus, and their relation to the coronary arteries.—I. D. London.

7482. Sitnikova, M. I. (Leningrad State U., USSR) **Vliyanie simpaticheskoi nervnoi sistemy na pessimum miyonevral'nogo sinapsa.** [Influence of the sympathetic nervous system on the pessimum of the myoneural synapse.] *Nervnaya Sistema*, 1968, No. 9, 77-80.—Thalamic deafferented frog preparations were used to study the "subordinating influences of the sympathetic nervous system on pessimal inhibition" of the myoneural synapse (sciatic nerve-gastrocnemius muscle). The data support the view that (a) in the pessimal state adaptive-trophic influences on the myoneural synapse are mediated through sympathetic pathways, and (b) pessimal inhibition, developing in the myoneural synapse, exhibits a parabolic nature.—I. D. London.

7483. Sokolova, G. P. & Zolotova, L. A. (Leningrad State U., USSR) **Zhirnye kisloty gangliozidov golovnogogo mozga.** [Fatty acids of the cerebral gangliosides.] *Nervnaya Sistema*, 1968, No. 9, 35-40.—Reports results of a study of the composition and concentration of fatty acids in fractions of cerebral gangliosides, isolated from rat and bull brains by means of fine-layered chromatography. Up to 10 different fatty acids are disclosed. Stearic acid constituted about 80% of the fatty acids.—I. D. London.

7484. Vilkova, V. A. (Leningrad State U., USSR) **Uchastie atsetata v sinteze glikogena.** [Participation of acetate in glycogen synthesis.] *Nervnaya Sistema*, 1968, No. 9, 24-27.—Studied (a) the rate of synthesis of glycogen from acetic acid in the hemispheres of the rat brain at different intervals of time after injection with acetate- $1-C^{14}$, and (b) the influence of insulin on this rate. The data indicate considerable participation of acetic acid in the biosynthesis of glycogen in hemispheric tissue. Insulin exerted a highly retardant effect thereon.—I. D. London.

7485. Zernicki, B. (Nencki Inst. of Experimental Biology, Warsaw, Poland) **Reflex as the unit of neuro-behavioral activity: A theoretical multidisciplinary approach to the reflex activity in higher animals.** *Acta Biologicae Experimentalis*, 1968, Vol. 28(4), 291-315.—Presents a general theory of reflex activity. The term reflex is used in its broad meaning, denoting both neural and effector responses to a currently acting stimulus. 2 kinds of reflexive central processes are discussed in detail: those which are manifested by psychic responses, and those which produce durable central changes. It is assumed that in a given reflex the effector responses usually consist of 3 elements: specific, orienting, and arousal response. An attempt is made to classify the reflexes. With regard to neuropsychic and behavioral criteria, the reflexes are divided into 5 groups: nonneuropsychic reflexes, targeting reflexes, neuropsychic simple feedback reflexes, consummatory reflexes, and preparatory reflexes. The control of the acquisitive reflexes by hunger and satiation defensive reflexes is also discussed. (45 ref.)—*Journal summary.*

7486. Zilov, V. G. (Sechenov Medical Inst., Moscow, USSR) **Vzaimodeistvie korkovykh i gipotalamicheskikh vliyanii na odinochnykh neuronakh retikulyarnoi**

formatsii srednego mozga. [Interaction of cortical and hypothalamic influences on single neurons of the mesencephalic reticular formation.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1326-1333.—Used 32 cats to determine (a) the degree to which superior divisions of the CNS exert control over single reticular neurons of the midbrain as compared to that exerted by the hypothalamus, and (b) which component in the combined corticohypothalamic complex of influences will be the dominant 1. It is shown that these reticular neurons have the ability to effectuate a convergence of diverse influences. However, 20% of them failed to respond to any of the stimuli applied, e.g., electrostimulation of the cerebral cortex. The non-reacting reticular neurons were characterized by either a high discharge frequency or the exceptionally regular character of their activity. The mesencephalic reticular neurons which react to stimulation were primarily excited by corticofugal impulses from the 1st sensorimotor area, and were inhibited under influences from the lateral sections of the posterior hypothalamus. The dominating role in the combined corticohypothalamic complex of influences on the reticular neurons belongs to the hypothalamus. (English summary) (28 ref.)—I. D. London.

Neuroanatomy

7487. Airapet'yants, E. Sh. & Sotnichenko, T. S. **Limbika.** [The limbic system.] Leningrad, USSR: Nauka, 1967. 118 p.—Presents a monograph on limbic structure and function, based on the literature and the authors' own research. An analysis of the connections of the limbic cortex with subcortical and other cortical structures is emphasized. A special appendix containing summaries of papers on the limbic system, read at the 23rd International Physiological Congress in Japan is included.—I. D. London.

7488. Boiko, E. I. **Mozg i psikhika.** [Brain and psyche.] Moscow, USSR: Prosveshchenie, 1969. 192 p.—Examines the principal data on the structure and activity of the human brain, treated from the standpoint of contemporary physiology of higher nervous activity, psychology, and cybernetics.—I. D. London.

7489. Gerke, P. Ya. **Problemy funktsionalnoi morfologii.** [Problems of functional morphology.] Riga, USSR: Zinatne, 1969. 296 p.—Presents a collection of 22 articles, a number of which are devoted to the ontogenesis and structure of nerve cells. The collection constitutes Issue 4 in this series.—I. D. London.

7490. Peck, Jeffrey W. & Novin, Donald. (U. Pennsylvania) **Evidence that osmoreceptors mediating drinking in rabbits are in the lateral preoptic area.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 134-147.—Hypertonic saline and sucrose, but not urea, induced drinking when injected (2 μ l. in 1 min.) directly into the lateral preoptic area (LPO) near the anterior commissure of New Zealand albino rabbits. In contrast, local cellular dehydration was not a stimulus in the dorsal (DHA) and lateral hypothalamus (LHA) where hypertonic saline nonspecifically excited neurons to induce drinking or eating. Ss, allowed isotonic saline and water, chose water immediately following either iv injections of hypertonic saline or intracranial injections into LPO, but not following injections into DHA or LHA. Electrolytic lesions, including the osmosensitive portion of LPO,

abolished the drinking that normally follows iv injections of hypertonic saline although ad-lib water intake was normal and not dependent upon the intake of dry food. (32 ref.)—*Journal abstract.*

7491. Wall, Patrick D. (University Coll., London, England) **The sensory and motor role of impulses travelling in the dorsal columns towards cerebral cortex.** *Brain*, 1970, Vol. 93(3), 505-524.—Animals with dorsal-column section can perform discriminations requiring detailed cutaneous sensory analysis, contrary to the classical hypothesis concerning its function. The effects of such section upon attentive and orienting responses to cutaneous stimuli were examined in 1 human patient and a series of rats. It is suggested that these tracts are essential only for discriminations in which active exploration of stimuli by motor movement or sequential analysis is required.—*W. A. Wilson.*

LESIONS

7492. Aronova, Z. A. (Pavlov Inst. of Experimental Medicine, Leningrad, USSR) **Vliyaniye odnostoronnego uslovnogo tormoza na dvigatel'nye refleksy, obrazovannyye na propriotseptivnoe razdrzhenie polovin yazyka.** [Influence of unilateral conditioned inhibition on motor reflexes, formed in response to proprioceptive stimulation of lingual halves.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 879-881.—Employed 2 dogs with split, exteriorized tongues in an attempt to (a) elaborate conditioned inhibition (CI) of a unilateral motor reflex, and (b) determine its influence on homo- and contralateral positive reflexes. Motor-defensive CRs were elaborated: the UCS employed was an electric shock of the forepaw; the CS employed was pressure on the lingual $\frac{1}{2}$, and shaking movements at the rate of 1/sec for 5 sec., 2 of which overlapped the UCS. Light flashes at the rate of 1/sec served as the accessory agent of CI, preceding lingual stimulation by 3 sec. Contrary to the findings of studies employing the secretory method, formation of the Stages 2-3 of CI observed depended on the typological features of the nervous system of the Ss. It is shown that the subsequent influence of unilateral CI on homolateral CRs displayed a phasic oscillatory character—something not observed in studies on unilateral CI of the secretory reflex.—*I. D. London.*

7493. Drazdovich, I. I. & Gordienko, V. M. (Research Inst. of Endocrinology & Metabolism, Kiev, USSR) **Sostoyaniye neurosekretornykh kletok suprapoticheskogo yadra posle adenektomii morskikh svinok.** [State of the neurosecretory cells of the supraoptic nucleus in adrenalectomized guinea pigs.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 117-124.—24 Ss were used to study the state of the hypothalamo-hypophyseal system after adrenalectomy. Bilateral adrenalectomy increased the functional activity of the neurosecretory neurons of the hypothalamic supraoptic nucleus. Along the hypothalamo-hypophyseal tract and in the neurohypophysis a decrease in neurosecretion, due to its release into the blood, was noted. The observed increase in neurosecretory activity of the anterior hypothalamic cells provided evidence for their participation in the regulation of adrenal glandular function.—*I. D. London.*

7494. Grigor'eva, G. I., Simanovskii, L. N., & Tarakanova, O. I. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) **Vliyaniye**

tireoidektomii na prispособitel'nye reaktsii zhivotnykh pri dlitel'nom deistvii gipoksii. [Influence of thyroidectomy on adaptive reactions of animals during the prolonged action of hypoxia.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1406-1410.—Used intact and thyroidectomized rats to determine whether active adaptive reactions in the brain and other tissues appear during acclimatization to high altitude (3200 m) over a 30-day period. Thyroidectomy resulted in retardation of the rate of glycolysis in cerebral tissue. Acclimatization accelerated the glycolytic rate, but not as markedly as in the intact S. (English summary)—*I. D. London.*

7495. Seggie, Jo. (Clarke Inst. of Psychiatry, Neuroendocrine Research Section, Ontario, Canada) **Effect of adrenalectomy or gonadectomy on affective behavior changes following septal lesions in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 11-19.—Performed adrenalectomy or gonadectomy in conjunction with a septal lesion in order to test the hypothesis that changes in affective behavior following a septal lesion in the rat (septal syndrome) result from altered brain function due to hyperfunction of the adrenal cortex and/or gonads. Ss were 10 male Wistar rats. Neither adrenalectomy nor gonadectomy was found to alter the characteristic appearance or duration of the septal syndrome, even when manipulations were performed to maximize the behavior changes observed following septal lesions. Results are discussed in terms of the ability of the Ss to cope with stress. It is concluded that although adrenal hypertrophy frequently follows septal damage, intactness of the adrenal glands or testes is not necessary for manifestation of the septal syndrome. (24 ref.)—*Journal abstract.*

7497. Spigelman, M. N. (U. Winnipeg, Manitoba, Canada) **Effects of age at onset and length of blindness on auditory spatial learning in the rat.** *Canadian Journal of Psychology*, 1969(Aug), Vol. 23(4), 292-298.—64 albino rats which had been peripherally blinded by enucleation shortly after birth performed significantly poorer on an auditory-spatial learning task than those blinded in a similar manner at 50, 100, or 150 days of age. Results indicate that age at onset of blindness exerts greater influence on adult spatial learning ability than does its duration, since the late-blind superiority is retained regardless of the duration of visual loss. The mechanisms underlying these effects are discussed. (French summary)—*Journal abstract.*

7498. Trahiotis, Constantine & Elliott, Donald N. (Indiana U., Center for Neural Science) **Behavioral investigation of some possible effects of sectioning the crossed olivocochlear bundle.** *Journal of the Acoustical Society of America*, 1970(Feb), Vol. 47(2, Pt. 2), 592-596.—Investigated the functions of the crossed olivocochlear bundle (COCB) in such measures as absolute thresholds in quiet, effective masking over differing noise levels and frequencies, and temporary threshold shifts (TTS). 6 cats with their right cochleas destroyed were given avoidance training with stimuli varied in octave steps from 125-16,000 Hz. After COCB transection of 3 Ss, it was found that (a) absolute thresholds were unchanged, (b) amount of masking at

1000 Hz. and 2000 Hz. increased (though the shift was not statistically significant with the small number of Ss tested), and (c) TTS did not differ greatly for the transected Ss. (20 ref.)—*Journal abstract.*

7499. Zefirov, L. N. (Medical Inst., Kazan, USSR) **O vliyaniya udaleniya podzheludochnoi zhelezy i vvedeniya atsetilkholina na elektricheskuyu aktivnost' myshitsy i funktsiyu mioneural'nogo soedineniya.** [On the influence of pancreatectomy and of acetylcholine administration on the electrical activity of the muscle and on the functions of the myoneural juncture.] *Fiziologicheskii Zhurnal SSSR*, 1966(Feb), Vol. 52(2), 137-144.—Utilized frog gastrocnemius muscle preparations to study the functions of the myoneural juncture, and the interaction of the impulses following pancreatectomy and subsequent acetylcholine administration. It is shown that prior pancreatectomy and the emergent acetylcholine deficit in the organism evoked (a) some increase in amplitude, (b) a slowing of muscle action currents, (c) the lengthening of absolute refractoriness of the myoneural juncture, and (d) an increase in time of transmission of excitation from the nerve to the muscle. The systematic administration of acetylcholine into the pancreatectomized S exerted a counterinfluence. The character of the interaction of the impulses in the myoneural juncture was changed following pancreatectomy. Sharp weakening and disappearance of manifestations of summation were observed, e.g., (a) increase in amplitude of the following action potential, (b) decrease in its duration, (c) quickening of time of transmission of excitation from nerve to muscle, and (d) acceleration of pessimal development. Data cannot be handled within the framework of the mediator theory of transmission of excitation from nerve to muscle and make it possible to view acetylcholine as a trophic factor.—*I. D. London.*

Brain Lesions

7500. Andreev, L. N. (Inst. of the Brain, Moscow, USSR) **Ob uchashtii khvostatykh yader v uslovno-reflektornoi deyateli'nosti sobak.** [On caudate nuclear participation in the conditioned response activity of dogs.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 809-815.—Studied (a) the specific nature of the changes in several forms of CRs (classical salivary, defensive local motor, simple running) in 1 S, resulting from partial extirpation of the caudate nuclei, and (b) the participation of the caudate nuclei in the activity of the motor analyzer. The CRs were elaborated, utilizing either immediate reinforcement or delay of reinforcement of up to 60 sec. In 5 Ss 2 different forms of CRs were represented, and partial extirpation was undertaken after their stabilization. Following the extirpation, retention of the CRs and different changes in their various forms were observed: (a) decrease in the magnitude and latency of the secretory conditioned reaction, (b) weakening of the defensive local motor reaction with lengthening of the latent period, and (c) decrease in the latent period of simple running without change in speed. Data are evidence for the fact that injury of the caudate nuclei appears in the many structural links which service each form of the CR. However, the resultant changes in these structural links are of different kinds and oppositely directed even in the same constellation. It is suggested that the role of the caudate nuclei in the CR is nonspecific and is suggestive

of the adaptive trophic function of the sympathetic nervous system in their influence on the functional state of the linking structures and in priming them for response.—*I. D. London.*

7501. Blass, Elliott M. (Johns Hopkins U.) **Effects of frontal-pole-area ablation on temperature regulation in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 233-239.—Adult female Sherman rats with ablation of the frontal-pole area (including the preoptic nuclei) were hyperthermic at room temperature. They remained hyperthermic at low ambient temperatures by working for more exogenous heat than normal Ss, and at high ambient temperatures by working for less exogenous coolant and spreading less saliva than normal Ss. Findings imply an elevation of a central reference temperature as the basis of the systematic adjustments in temperature regulation following frontal-pole-area ablation, and stress the synergistic action of physiological and behavioral systems in the maintenance of core temperature. (19 ref.)—*Journal abstract.*

7502. Blum, B., Kauli, N., Liban, E., & Levy, P. (Tel-Aviv U., Israel) **Paroxysms of T-wave alterations in the ECG in experimental epilepsy due to foci in the pseudosylvian gyrus.** *Life Sciences*, 1970(Feb), Vol. 9(4, Pt. 1), 219-225.—Epileptogenic lesions were placed in the temporal lobe side of the cat's pseudosylvian gyrus, a region which has been regarded as the homologue in this species of the primate insula. Seizures were observed in the Ss which included EKG alterations and uniquely consisted of T wave inversions and equivalent signs such as ST-segment depression or ST-segment elevation. Admitting other possible explanations, it was proposed, on the basis of their similarity to EKG disturbances observed in ischemic heart disease, that they were the result of neuronogenic or neurohumorally induced currents of injury in the heart muscle, due to pathologic CNS activity. A relationship of these phenomena to the psychosomatic factors in ischemic disease was suggested. Attention was drawn to the possibility that similar cardiac involvements may occur also in clinical epilepsy due to foci in homologous areas. (16 ref.)—*Journal summary.*

7503. Butters, Nelson & Pandya, Deepak. (Veterans Administration Hosp., Boston, Mass.) **Retention of delayed-alternation: Effect of selective lesions of sulcus principalis.** *Science*, 1969(Sep), Vol. 165(3899), 1271-1273.—Tested 12 rhesus monkeys with bilateral lesions of the anterior, middle, or posterior thirds of the principal sulcus, the periacuate prefrontal region, or of the inferior parietal lobule for retention of spatial delayed-alternation. Lesions limited to the middle 1/4 of sulcus principalis resulted in failure to relearn delayed-alternation within 1000 trials; lesions elsewhere had little effect.—*Journal abstract.*

7504. Dalby, David A. (Ohio State U.) **Effect of septal lesions on the acquisition of two types of active avoidance behavior in rats.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 926.

7505. Darian, David K. (St. Norbert Coll.) **The effects of septal, thalamic, and tegmental lesions on general activity in the hooded rat.** *Canadian Journal of Psychology*, 1969(Oct), Vol. 23(5), 303-314.—Compared 19 male hooded rats with either septal, medial thalamic, or tegmental reticular formation lesions on 3 measures of spontaneous activity (a brief test in a novel maze and 7-day tests in running wheels or photocell cages). Wheel

running was depressed by all the lesions (especially septal and tegmental), whereas cage activity and locomotion in the maze were unaffected. Septal-damaged Ss groomed more than all other groups and reared less than 7 controls in the maze. Rearing in the maze and running in the wheels were positively correlated and both were negatively correlated with grooming in the maze. Results are discussed in terms of competing-response classes and 1-factor hypothesis of the neural control of spontaneous behavior. (French summary) (23 ref.)—*Journal abstract*.

7506. Egorova, M. P. (Leningrad State U., USSR) **Nekotorye formy prostranstvennogo analiza i polianalizatornaya konvergentsiya v kore mozga u obez'yan.** [Some forms of spatial analysis and polyanalyzer convergence in the monkey cerebral cortex.] *Nervnaya Sistema*, 1968, No. 9, 99-102.—3 rhesus monkeys were used to study (a) the complex forms of spatial analysis after stepwise extirpation of the dorsolateral surface of the frontal cortex, Cortical Field 6 in the precentral gyrus, and Cortical Fields 1-3 in the postcentral gyrus (making use of motor-alimentary CRs to visual and auditory stimuli), and (b) the evoked electrical responses in these structures to heteromodal stimuli. Complex forms of visual and auditory spatial analysis were not affected after bilateral extirpation of the frontal cortex of Field 6 of gyr. precentralis and Fields 1-3 of gyr. postcentralis. Evoked potentials of short latency in response to photic, acoustic, and electrocutaneous stimulation were recorded from the surface of the frontal cortex and from the gigantopyramidal fields.—*I. D. London*.

7507. Harvey, John A. & Lints, Carlton E. (U. Iowa) **Lesions in the medial forebrain bundle: Relationship between pain sensitivity and telencephalic content of serotonin.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 28-36.—Lesions in the medial forebrain bundle (MFB) or injection of p-chlorophenylalanine decreased brain content of serotonin and decreased jump thresholds in 54 male albino Holtzman rats. The effects of lesion and drug were not additive indicating that a common system was being affected by both procedures. Injection of 75 mg/kg DL-5-hydroxytryptophan into Ss with lesions returned both the jump threshold and serotonin content to normal values. The correlation between jump threshold and telencephalic serotonin was +.80. Brainstem serotonin was not related to jump threshold. Decreases in jump threshold were interpreted as indicating an increased pain sensitivity. It is concluded that this behavioral effect of the MFB lesion is secondary to the effects of the lesion on serotonin content of the telencephalon. (18 ref.)—*Journal abstract*.

7508. Killackey, H., Snyder, M., & Diamond, I. T. (Duke U.) **Function of striate and temporal cortex in the tree shrew.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 2), 29 p.—Studied striate and "temporal" areas of the cortex by the ablation method in 2 experiments. After complete removal of the striate cortex, 2 1-yr-old tree shrews were capable of relearning a series of discrimination reversal tasks in which the stimuli pairs were black-white, blue-red, and horizontal-vertical stripes. However, the same lesion in 3 additional Ss made the task of discriminating triangles embedded within an annulus difficult if not impossible. In contrast, temporal area lesions in 6 Ss permanently abolished the ability to form a reversal learning set and resulted in retarded learning of habits based on pattern

discrimination. This dissociation of syndromes implies that the 2 cortical areas receive visual impulses from independent thalamic sources. (21 ref.)—*Journal abstract*.

7509. Novikov, V. G., Rudneva, L. M., & Drozdovich, I. I. (Kiev U., USSR) **Funktsional'noe sostoyanie karkovogo veshchestva nadpocheknikov u pekinskiikh utok pri elektroliticheskom povrezhdenii sredinnogo vozvyseniya.** [Functional state of the adrenal cortex of Peking ducks with electrolytic lesion of the eminentia mediana.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 125-133.—Reports on the changes observed in the microscopic structure of the adrenals after electrolytic extirpation of the eminentia mediana in 15-day-old ducks. The data indicate that the hormonal functions of the adrenal cortex in birds do not depend on the hypothalamus as much as do the generative and hormonal functions of the gonads.—*I. D. London*.

7511. Winans, Sarah S. (Cornell U., Medical School) **The discrimination of stimuli equated for luminous flux by striate decorticate cats.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1027.

7512. Winans, Sarah S. (U. Michigan, Medical School) **Visual cues used by normal and visual-decorticate cats to discriminate figures of equal luminous flux.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 167-178.—3 unoperated adult cats and 9 cats with Cortical Areas 17, 18, and most of 19 removed made equal numbers of errors in learning to discriminate between erect and inverted transilluminated triangles of equal flux. Both groups subsequently discriminated between erect and inverted triangles of unequal sizes, in outline and partial form, and between triangles presented at a distance such that they fell wholly within the Ss' visual fields. However, both groups failed when triangles appeared in novel positions and when figure-ground brightness relationships were reversed. These findings and responses on test trials with triangles of unequal sizes and in novel positions suggest that regional flux differences within the stimuli had been significant cues for both groups of Ss on the original discrimination. (17 ref.)—*Journal abstract*.

Brain Hypothalamic & Hippocampal Lesions

7513. Ferguson, Norman B. & Keesey, Richard E. (U. Wisconsin) **Comparison of ventromedial hypothalamic lesion effects upon feeding and lateral hypothalamic self-stimulation in the female rat.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 263-271.—Observed both lateral hypothalamic (LH) self-stimulation and feeding in 29 female Holtzman rats following placement of electrolytic lesions in the ventromedial hypothalamus (VMH). The increased food intake resulting from VMH destruction persisted for several wk., reaching its highest level 4-11 days postlesion. LH self-stimulation rates, in agreement with previous reports, increased immediately following lesioning; however, by 24 hr. postlesion, responding had returned to or below control levels. The degree of hyperphagia and rate of LH self-stimulation were found to be negatively

correlated ($r = -.53$) across a 6-day postlesion test period. This lack of correspondence between the effects of VMH lesions upon feeding and LH self-stimulation is inconsistent with the position that VMH hyperphagia results from enhanced sensitivity of an LH feeding-reward system. It is suggested that hypothalamic hyperphagia be viewed as behavior appropriate to increasing the level of body weight to an elevated regulation set-point.—*Journal abstract.*

7514. Grossman, Sebastian P. & Grossman, Lore. (U. Chicago) Food and water intake in rats with parasagittal knife cuts medial or lateral to the lateral hypothalamus. *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 148-156.—Parasagittal knife cuts lateral to the hypothalamus, which did not directly damage cellular components of the hypothalamus or of that portion of the globus pallidus which is lateral to it, produced transient aphagia and adipsia in 33 female albino Sprague-Dawley rats. All Ss eventually recovered some regulatory abilities with respect to food intake, but did not regulate water intake when food deprived. Similar cuts along the lateral border of the hypothalamus produced long-term aphagia and adipsia. Most of these Ss did not recover any regulatory ability with respect to either food or water intake within the 80 days of postsurgical observation. Parasagittal cuts through the medial 3rd of the lateral hypothalamus produced transient aphagia and adipsia followed by a return of adequate regulation of food and water intake on a diet of powdered food. When offered a preferred pellet diet, these Ss overate. They showed further signs of "finickiness" when diets adulterated with dextrose or quinine were offered. The S's ability to regulate water intake in the absence of food remained disturbed.—*Journal abstract.*

7515. Pigareva, M. L. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) Vliyaniye razrusheniya gippokampa na uslovnoreflektornoe perekiyucheniye u belykh kryss. [Influence of hippocampal extirpation on conditioned response switchover in white rats.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 801-808.—Studied motor alimentary and electrodefensive CRs, elaborated to the same stimulus (bell), at different times of the day and change in general illumination taking on the role of switchover signal (morning utilized for elaboration of the motor alimentary CR, evening for that of the electrodefensive CR). After hippocampal extirpation there was a significant increase in the number of intersignal reactions and in spontaneous running. It was possible to elaborate the switchover of heterogeneous CRs in hippocampectomized Ss in 3-5 days. However, switchover can be elaborated in intact Ss either not at all or only after 13-20 experimental sessions. Hippocampal extirpation exerted no essential influence on elaborated and stabilized CR switchover. Hippocampal extirpation in the presence of (a) disturbed CR activity; (b) a neurotic state, induced by the elaboration of switchover; or (c) unstabilized switchover led to normalization of CR activity.—*I. D. London.*

7516. Sclafani, Anthony & Grossman, Sebastian P. (U. Chicago) Reactivity of hyperphagic and normal rats to quinine and electric shock. *Journal of Comparative & Physiological Psychology*, 1970(Jan), Vol. 74(1, Pt. 1), 157-166.—Lesions of the ventromedial hypothalamus of 25 female Sprague-Dawley rats which resulted in hyperphagia and obesity also produced a passive-

avoidance deficit, i.e., increased the number of punished drinking responses. The passive-avoidance deficit appeared to be related to increased appetitive drive since it was not apparent when the water intake of the lesioned Ss was equated to that of controls. Results of other experiments demonstrate that hyperphagic Ss overreact to quinine adulteration of their ad-lib water but react normally to the addition of mild electric shock to their water supply. This differential reactivity to quinine and electric shock has implications concerning hypothalamic finickiness which are discussed. (24 ref.)—*Journal abstract.*

BRAIN STIMULATION

7517. Urey, Harold C. (Lunar Science Inst., Houston, Tex.) Reticular stimulation and chlorpromazine: An animal model for schizophrenic overarousal. *Science*, 1969(Sep), Vol. 165(3899), 1273-1275.—Developed a model to test the hypothesis that certain schizophrenic patients are in a state of continual central excitation and that improvement in these patients after treatment with chlorpromazine is a result of the action of the drug in reducing this excitation. 6 male albino Holtzman rats were electrically stimulated in the mesencephalic reticular formation while performing a simple attention task. Stimulation or treatment with chlorpromazine impaired the performance of the Ss; however, the 2 treatments together resulted in performance indistinguishable from that seen after injections of saline alone.—*Journal abstract.*

Chemical Stimulation

7518. Bogach, P. G. & Tyshkevich, B. A. (Kiev U., USSR) Vliyaniye pryamogo vvedeniya adrenalina i atsetilkholina v gipotalamicheskuuyu oblast' na priem pishchi u sobak. [The effect of direct injection of adrenaline and acetylcholine into the hypothalamic region on food intake in dogs.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 3-14.—The injection of adrenaline (adrenergic) and acetylcholine (cholinergic) solutions into the lateral and ventromedial hypothalamus and in the 3rd ventricle of 6 dogs was made through canulae, implanted from the basal side of the brain. Direct local adrenergic stimulation of the lateral hypothalamus increased food intake and decreased time of eating; injection into the ventromedial hypothalamus decreased food intake and increased time of eating. Direct cholinergic stimulation of the lateral hypothalamus decreased food intake; local injection into the ventromedial hypothalamus increased it. The influence on food intake by direct adrenergic and cholinergic chemical stimulation of the hypothalamus was of short duration and continued for 30-40 min., both in hungry and partially fed Ss. The normal daily quantity of food eaten was restored to normal level 24 hr. after adrenaline or acetylcholine injections as a result of alimentary compensation during the final 4-6 hr.—*I. D. London.*

7519. Danilova, R. A. (Moscow State U., USSR) Vliyaniye razrusheniya ribonukleinoi kisloty gippokampa na tsepnye uslovnye refleksy kryss. [Influence of neutralization of hippocampal ribonucleic acid on chain conditioned reflexes in rats.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 427-431.—30 white rats, with an elaborated 3-component chain CR with alimentary reinforcement, were used to

study the influence of RNA, injected cannularly into the hippocampus and several areas of the neocortex, on chain CRs (red light → leap to shelf 3, metronomic clicks (60/min) → leap to Shelf 2, white light → leap to Shelf 1). RNA injected into the dorsal region of the hippocampus (50-400 microgm.) produced complete or partial inhibition of the chain CR. Restoration of the CR occurred after different intervals of times, depending on RNA dosage and degree of its stabilization. An analogous effect was observed with injection of RNA into the temporal area of the cortex. With RNA injection into the motor and visual cortical zones, CRs were disturbed. Alimentary excitability and motor activity in rats were not changed. The data suggest that a definite level of RNA is necessary in the hippocampus for the normal reproduction of elaborated CRs.—*I. D. London.*

7520. Howard, R. Lee & Meyer, Donald R. (Ohio State U.) **Motivational control of retrograde amnesia in rats: A replication and extension.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 37-40.—Trained 72 male and female Long-Evans hooded rats on a series of 3 2-choice discrimination problems. The study replicated M. J. Robbins and D. R. Meyer's (see PA, Vol. 44:11961) study which concluded that retrograde amnesia for long-term habits can be produced by single ECS treatments and are under motivational control. The 1st and 3rd problems of a given series were learned under similar incentive/motivational conditions, while the 2nd problem was learned under a different incentive/motivational condition. When they had mastered their 3rd problem, experimental Ss were given a single ECS. This produced amnesia for the 1st but not the 2nd habit. Control Ss subjected to sham ECS procedures showed excellent retention of both habits. Running-time data indicate that the effect is uninterpretable in terms of ECS merely serving as a punishment.—*Journal abstract.*

7521. Koval', L. A. (Kiev U., USSR) **Vliyaniye vvedeniya adrenalina, atsetilkholina i pituitrina v gipotalamus na motoriku zheludочно-kishechnogo trakta i reflektornye vzaimodeystviya mezhdu razlichnymi ego otdelami.** [Influence of adrenaline, acetylcholine and pituitrine injections into the hypothalamus on the motor behavior of the gastrointestinal tract and on the reflex interactions between its different parts.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 29-38.—Ss were dogs with gastric and small intestinal fistulae. Acetylcholine, adrenaline, and pituitrine, administered through canulae implanted into the hypothalamus, produced a biphasic action on small intestinal activity. Stomach motility underwent no change after their administration in the rest period. The injection of all 3 agents into the hypothalamus produced certain changes in the gastric and small intestinal reflex reactions to eating and stimulation of the gastric and rectal mechanoreceptors. The effects of hypothalamic stimulation and of reflex reaction, if in the same direction, reinforced each other. If the effects of hypothalamic stimulation and reflex reactions were oppositely directed, their combined action produced a mutual weakening of effects.—*I. D. London.*

7522 Margules, D. L. (Wyeth Lab., Philadelphia, Pa.) **Noradrenergic synapses for the suppression of feeding behavior.** *Life Sciences*, 1969(Jul), Vol. 8(13, Pt. 1), 693-704. Direct application of 1-norepinephrine hydrochloride crystals to the perifornical region of the medial forebrain bundle suppressed milk-licking behav-

ior in 7 albino Charles River rats. The noradrenergic blocker, phentolamine hydrochloride, removed the suppressant effects of satiation on this behavior. Results, in conjunction with results of lesion and histochemical fluorescent studies, suggest that satiation for food is mediated by collaterals of ventromedial hypothalamic cells that form noradrenergic synapses on the medial forebrain bundle and in other brain regions. (31 ref.)—*Journal summary.*

7523. Sideroff, S., Schneiderman, N., & Powell, D. A. (U. Miami) **Motivational properties of septal stimulation as the US in classical conditioning of heart rate in rabbits.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 1-10.—Examined heart-rate (HR) classical conditioning, shuttle-box training, and bar-press self-stimulation in male albino rabbits in 3 experiments as a function of 3 intensities of electrical stimulation of the septal region. In the HR classical conditioning experiment ($n = 24$), CRs failed to occur in a low-intensity group even though reliable UCRs were elicited. In 2 higher intensity groups HR CRs were decelerative. 12 Ss from Exp. 1 made approach responses to the lowest UCS intensity, but escape responses to higher intensities when tested in the shuttle box. In the self-stimulation experiment, 8 naive Ss bar pressed at all 3 intensities. At the 2 highest values, bar pressing was accompanied by attempted escape responses. It is concluded that HR classical conditioning to septal stimulation requires an aversive component to the UCS. (35 ref.)—*Journal abstract.*

7524. Singer, G. & Montgomery, R. B. (Macquarie U., School of Behavioural Sciences, North Ryde, New South Wales, Australia) **Functional relationships of brain circuits in control of drinking behavior.** *Life Sciences*, 1970(Jan), Vol. 9(2, Pt. 1), 91-97.—Examined the functional relationship between the amygdaloid and septal cholinergic circuits through injections via cannulae of carbachol, atropine, and placebo into male albino Wistar rats under food- and water-satiation conditions. Cholinergic stimulation of the lateral septal area increased water intake in the satiated rat and simultaneous cholinergic stimulation of the amygdaloid cortical nucleus augmented this increase. Simultaneous anticholinergic blockade with atropine in the amygdaloid cortical nucleus reduced drinking to control level. Cholinergic stimulation in the amygdaloid cortical nucleus and simultaneous stimulation with atropine of the septal area produced no response. It is concluded that the activity in the amygdaloid circuit is dependent on the level of activity in the septal circuit and once the amygdaloid circuit is activated by chemical stimulation it modulates the behavioral output of the septal circuit; this modulatory influence is seen as necessary for septal circuit output. The present findings lend support to an interacting neural circuit model for the control of drinking behavior.—*W. E. Wood.*

7525. Vasil'eva, L. A. & Samoilova, L. A. (Leningrad State U., USSR) **K voprosu o kortikal'nykh vliyaniyakh na sistemu slukhovogo analizatora.** [On cortical influences on the auditory analyzer system.] *Nervnaya Sistema*, 1968, No. 9, 93-98.—In rats under hexenal narcosis recordings were made of biopotentials from the frontal and auditory cortical zones, the mesencephalic rostral reticular formation, and the mesencephalic posterior colliculi. Application of strychnine to the auditory cortex produced an increase in the amplitude of the posterior collicular response to sound,

while its application to the frontal cortical areas produced an increase in the responses of the mesencephalic reticular formation to acoustic and photic stimuli and decreased the amplitude of spontaneous rhythm. The creation of spreading depression in the cortex by placing KCl on the motor zone produced a slight depression of spontaneous activity and did not change the character of the responses to sound and light from the reticular formation.—*I. D. London.*

Electrical Stimulation

7526. Barrett, Robert J., Hughes, Richard A., & Ray, Oakley S. (Veterans Administration Hosp., Psychology Research Lab., Nashville, Tenn.) **ECS disruption of time-dependent processes in discriminated-avoidance conditioning in rats: Incubation or consolidation?** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 319-324.—Used discriminated active avoidance in an automated Y maze to study ECS-induced disruption of retention in male inbred albino CDF strain rats. Results from Exp. I with 100 Ss show that ECS increased errors to criterion avoidance on Day 2 retest when given the following either 10, 15, or 20 training trials on Day 1, but not following 0, 5, or 30 trials. In Exp. II, 96 Ss were given 15 trials followed by either ECS or training to criterion 30 sec., $\frac{1}{2}$, 1, 3, 6, or 12 hr. later. ECS Ss were tested 24 hr. after treatment. The ECS given 30 sec., $\frac{1}{2}$, 1, or 3 hr. following training increased errors to criterion as compared to the 12 hr., no-ECS retest group. Results suggest that incubation of fear and memory consolidation are 2 time-dependent processes which occur following training in an aversively motivated task. Valid assessment of ECS-induced amnesia is possible only at posttraining intervals during which performance is not confounded by the presence of a CER. (28 ref.)—*Journal abstract.*

7527. Black, Manuel & Suboski, Milton D. (Queen's U., Kingston, Ontario, Canada) **Incubation and ECS-produced gradients in one-trial and multitrial discriminated-avoidance conditioning in rats.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 325-330.—Exp. I with 100 male Long-Evans rats showed that in 1-trial discriminated-avoidance conditioning response latency incubated, i.e., changed as a function of postconditioning time, whereas response choice did not. Previous research had shown that retrograde interference produced by ECS in the same task was temporally graded for latency and ungraded for choice when ECS followed learning by more than 1 min. Multitrial discriminated avoidance in Exp. II with 107 Ss yielded parallel incubation and ECS-produced gradients for both response latency and choice. Results support the hypothesis that ECS disrupts the incubation of freezing behavior rather than temporally prolonged memory consolidation. (15 ref.)—*Journal abstract.*

7529. Danelia, D. S. & Mestvirishvili, L. P. (Inst. of Clinical & Experimental Neurology, Tbilisi, USSR) **Vliyaniye aktivatsii retikulyarnoi formatsii srednego mozga na sodurozhnyuyu aktivnost'. [Influence of activation of the mesencephalic reticular formation on convulsive activity.] Fiziologicheskii Zhurnal SSSR,**

1969(Nov), Vol. 55(11), 1334-1341.—Used 20 unanesthetized cats under curarization in a microelectrode study of the neurons of the posterior sigmoid gyrus, and an EEG study of various regions of the cerebral cortex and subcortical structures. Convulsive activity was elicited by low-frequency electrostimulation of the specific thalamic nuclei (n. ventralis posterolateralis and geniculatum mediale); EEG desynchronization by high frequency stimulation of the mesencephalic reticular formation (MRF) or the nonspecific thalamic nucleus (n. centralis medialis). Activation of the MRF and of the diffuse thalamic system facilitated the triggering of convulsive activity, which was generated by stimulation of the specific thalamic nucleus. In raising the general level of excitability, nonspecific impulsation increased the synchronous action of cortical neurons in response to excitation following an oligosynaptic pathway. Stimulation of the MRF against a background of generalized clonic seizure did not alter the picture of convulsive discharges. In the tonic phase of epileptic discharges, the MRF produced a transition to the clonic phase, and in focal convulsions a transition to their generalization. (English summary)—*I. D. London.*

7530. Glagolev, V. P. (Kiev U., USSR) **Izmenenie sostava limfy i krovi pri razdrazhenii gipotalamusa. [Changes in the composition of the lymph and blood under hypothalamic stimulation.] Problemy Fiziologii Gipotalamusa**, 1969, No. 3, 67-74. 47 nembutilized dogs were used to study the concentration of sugar, sodium and potassium in the lymph and blood before and after stimulation of different regions of the hypothalamus. An increase in sugar occurred under stimulation of the anterior and lateral hypothalamus by a weak electric current; for Na and K, a decrease. Stimulation of the mammillary bodies and the tuber cinereum produced different changes in Na and K concentration. These changes in chemical structure developed in the lymph and blood simultaneously and were brought about with pancreatic and suprarenal participation.—*I. D. London.*

7531. Goldrich, S. G., Pond, F. J., Livezey, P., & Schwartzbaum, J. S. (Ohio State U.) **Electrically-induced afterdischarges in the inferotemporal cortex of monkeys: Effects on visual discrimination and discrimination-reversal performance.** *Neuropsychologia*, 1970(Nov), Vol. 8(4), 417-429. Afterdischarges induced bilaterally in inferotemporal (IT) cortex, as monitored by EEG recording, impaired subsequent performance of 9 feral monkeys on perceptually difficult visual discriminations of dimensionalized stimuli during the period of abnormal IT EEG activity. The defect seemed to relate to control levels of performance and varied somewhat in persistence. Such seizures also markedly impaired reversals of a visual pattern discrimination. Based on information about propagation patterns of the afterdischarges, it is suggested that afterdischarges induced in IT cortex produce some form of visual perceptual or attentional disorder and an associative disorder in the encoding of visual stimuli with respect to reward contingencies. (French & German summaries) (28 ref.)—*Journal abstract.*

7532. Gromova, E. A. & Gil'man, I. M. (Inst. of Normal & Pathological Physiology, Moscow, USSR) **Stranitel'nyi analiz voshkodyashchikh vliyaniy razlichnykh oblastei gipotalamusa na koru golovnogo mozga i povedeniye nenarkotizirovannykh koshek. [Comparative analysis of ascending influences**

of different hypothalamic regions on the cerebral cortex and the behavior of unanesthetized cats.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 870-875.—Attempted to determine the influence on the EEG of electrical stimulation of various regions of the hypothalamus. It was found that high-frequency stimulation (100-300 cps) of these regions was accompanied by desynchronization of electrical activity of the brain; while low-frequency stimulation (4-6 cps) yields a synchronizing effect. Subsequent electrocoagulation of these regions of the hypothalamus elicited a synchronization of EEG rhythms which is similar in character and degree. It is concluded that the posterior hypothalamic structures exert a continuous tonic action on the cerebral cortex and possibly variously affecting influences.—I. D. London.

[Convulsive discharges on repeated stimulation of the simian cortex.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1318-1325.—Used 8 alert rhesus monkeys with chronically implanted electrodes to study the temporal and electrophysiological characteristics of convulsive attacks, elicited repeatedly by threshold and suprathreshold electrical stimulation of cortical structures (9 points of stimulation in the prefrontal and 2 in the motor region). 3 successive phases were distinguished in the prefrontal or motor cortical convulsive discharge: high voltage waves with a frequency of 4-9 oscillations/sec, polymorphic convulsive activity, and convulsive complexes. The duration of the convulsive discharge was shortened with threshold electrostimulation, repeated after 15 min. With supra-threshold stimulation, repeated after 15 min., the duration of the convulsive discharge was significantly prolonged. (English summary) (20 ref.).—I. D. London.

7536. Pavlygina, R. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) *Vzaimootnosheniye neapsalicheskoi talamicheskoi i zritel'noi sistem*. [Interrelationship between the nonspecific thalamic and the visual systems.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 319-327. Used 25 cats to study the interaction between the recruitment reaction and evoked potentials in response to light on simultaneous presentation of rhythmic electrical and photic stimulation. Stimulation of the medial thalamic nuclei, evoking the recruitment reaction in the cerebral cortex, was combined with light flashes, rhythmically and temporally presented so as to coincide with the electrical stimulation applied. Investigation of the recruitment reaction in the motor cortex, on stimulation of different medial nuclei of the thalamus

and of various levels of the same nucleus, disclosed a fine morphophysiological differentiation in the "so-called nonspecific system of the thalamus." Both the evoked responses to light and the recruitment reaction were changed on simultaneous stimulation of the specific visual system and the nonspecific thalamic system. The amplitude of the initial negative deviation of the primary response to light increased slightly, while the amplitude of secondary negative oscillations, following immediately upon the beginning positive-negative response, increased substantially. The recruitment reaction, on simultaneous presentation of stimulation, did not undergo substantial change, but right after the usual response to each stimulation of the thalamus a large slow negative deviation appeared. Data on the CR change produced in cortical evoked potentials, following joint stimulation of short duration, indicate the necessary participation of a cortical inhibitory process "in [CR] closure of this type."—I. 7538. Rabinovich, M. Ya. & Kopytova, F. V. (Inst. of the Brain, Moscow, USSR) *Effekty sochetaniya polarizatsii dvigatel'noi zony kory s deistviem zvukovykh stimulov*. [Effects of combining polarization of the cortical motor zone with the action of acoustic stimuli.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 768-777.—Recorded the activity of 108 cortical motor neurons in 14 alert rabbits, before and during anodic polarization of the cortical motor surface and after cessation of the polarizing current, in a study of the responses of the cells to 2 acoustic stimuli with different frequencies. 1 frequency ("positive") was repeatedly applied (20-25 presentations) during polarization, and the other ("negative") 1-2 times (occasionally 3 times). In 82 neurons spontaneous activity was modified under the action of the polarizing current. Out of 51 cells, earlier responding during polarization to the 2 stimuli, 24 neurons reacted, after cessation of the polarizing current, to only the positive stimulus. 22 cells exhibited after-actional responses to both positive and negative stimuli. 3 neurons displayed a paradoxical reaction and responded to stimuli of negative significance, while failing to react to positive stimuli. A number of neurons retained, in polarization-afteraction, differentiated responses to positive and negative stimuli for periods of up to 20-30 min. It is suggested that there is a connection between the traces of 1 stimulus (polarization) and those of another stimulus (sound)—traces which are later restored by the action of only a sensory stimulus. Similar "intertwining" of traces indicates the existence of probability-mechanisms for cellular transition from polysensory activity to special reactions to stimuli of signal significance. The effects of pairing polarization with the action of sensory stimuli may be viewed as 1 of the varieties of "reflexes to state."—I. D. London.

7539. Reitz, Sandra L. & Gerbrandt, Lauren K. (American Inst. for Research, Palo Alto, Calif.) *Pre- and posttrial temporal lobe seizures in monkeys and memory consolidation*. *Journal of Comparative &*

Physiological Psychology, 1971(Feb), Vol. 74(2), 179-184.—Compared learning in 4 unstimulated rhesus monkeys with that in 3 Ss receiving pre- or posttrial stimulation. Results show that stimulation applied to the inferotemporal cortex produces an afterdischarge which temporarily disrupts visual discrimination learning, but only when this afterdischarge occurs during the appearance of the discriminanda. There is no impairment when it occurs just after the response. Results conflict with the hypothesis that inferotemporal cortex is involved in consolidation of visual information, in mediating information transfer from a temporary to a more durable state, suggesting, instead, that this area is effective during reception of the stimuli, affecting the way in which the visual world is perceived and, hence, what is stored and can be recognized.—*Journal abstract.*

7540. Ryabinina, M. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Neironnaya aktivnost' senzomotornoi kory krolka pri razdrzhenii retikulyarnoi formatii srednego mozga.** [Neuronal activity of the rabbit sensorimotor cortex with stimulation of the mesencephalic reticular formation.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 846-852.—Utilized extracellular microelectrode recordings of 166 neurons in the sensorimotor cortex of alert rabbits to study the dynamics of neuronal activity in the sensorimotor cortex over a definite time period, following the application of single electrical stimulation to the mesencephalic reticular formation (MRF). Since the stimulating agent led to a motor reaction, attention was directed to a comparison between time of increase in cortical neuronal activity and time of appearance of the motor reaction, in order to decide whether "closure" of the effector path from the reticular formation occurred through the cortex or whether it involved only the subcortical motor centers. The activity of a considerable number of the sensorimotor cells changed upon stimulation of the MRF with single electrical stimuli. Stimulation of the MRF resulted in the activation of spontaneous impulse activity in a great number of the cells (43.9%), while a smaller number underwent inhibition (15.7%). In most cases impulsation increased 20-40 msec. after stimulation was applied. The greatest increase in spontaneous cellular activity resulting from stimulation of the MRF, occurred in the 3rd cortical layer. Stimulation of the MRF evoked a motor reaction with a latent period of 8-9 msec. Since no increase in neuronal activity in the sensorimotor cortex preceded movement, it is concluded, on the basis also of other findings, that the motor reaction is the result of subcortical motor mechanisms.—*I. D. London.*

7541. Smirnova, L. A. Vliyaniye razdrzheniya gipotalamusa i struktur limbicheskoi sistemy na motornuyu deyatel'nost' zheludochno-kishechnogo trakta u melkikh zhvachnykh zhivotnykh. [Influence of stimulation of the hypothalamus and the structures of the limbic system on motor activity of the gastrointestinal tract in small ruminant animals.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 22-28. Ss were 14 sheep and goats with ruminal, reticular, abomasal, small and large intestinal fistulae. Multipolar electrodes were inserted in the hypothalamic region, the anterior gyrus cinguli, amygdaloid nuclei, and hippocampus. Electrical stimulation of these structures produced changes in the motor activity of the gastrointestinal tract. The character, latent period, and duration of these changes were a function of the strength of electric current and the functional state of the gastrointestinal tract. Changes in motor activity were accompanied by definite behavior reactions.—*I. D. London.*

7544. Tsybenko, V. A. (Kiev U., USSR) **Vliyaniye razdrzheniya gipotalamusa na davlenie v zheludochkakh serdtsa.** [Influence of hypothalamic stimulation on pressure in the ventricles of the heart.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 58-66. Stimulation of the lateral hypothalamus in 18 nembutalized dogs brought about, in most cases, a rise of pressure in the right ventricle by 42% and a simultaneous decline of pressure in the left ventricle by 23%. The oppositely directed changes in pressure in the ventricles of the heart did not depend on respiration, since they were retained under artificial respiration, but were connected with the different vasomotor reactions occurring in systemic and pulmonary circulation.—*I. D. London.*

7545. Ungerleider, Leslie G. & Coons, Edgar E. (New York U.) **A behavioral measure of homosynaptic and heterosynaptic temporal summation in the self-stimulation system of rats.** *Science*, 1970(Aug), Vol. 169(3947), 785-787. Bilateral stimulation of the medial forebrain bundle with pulses of varying interpulse intervals elicited a pattern of self-stimulation behavior in 4 Sprague-Dawley rats indicative of temporal synaptic summation: the shorter the interval the greater the response. In contrast, the effectiveness of unilateral stimulation at very short intervals was limited by neuronal refractory periods. Results support the notion that there is convergence of the medial forebrain bundle self-stimulation system from the 2 sides of the brain and suggest ways of studying the degree of convergence. They also suggest a technique for behaviorally comparing heterosynaptic and homosynaptic mechanisms of summation. (15 ref.)—*Journal abstract.*

ELECTRICAL ACTIVITY

7546. Aĭrapetyan, A. A. & Vaganyan, L. G. (Orbeli Inst. of Physiology, Erevan, USSR) **O nekotorykh osobennostyakh neuronoi aktivnosti v mozghechkovo-talamo-korkovoi regul'yatornoi sisteme.** [On several features of neuronal activity in the cerebello-thalamo-cortical regulatory system.] *Fiziologicheskii Zhurnal SSSR*, 1970(Apr), Vol. 56(4), 527-534. Immobilized cats were used in a study, utilizing extracellular microelectrode recordings, of (a) the responses of individual neurons of the nonspecific thalamic nuclei (CM and VA) to electrical stimulation of the central cerebellar nuclei (dentate, intermediate, fastigiate), and (b) the reaction of

neuronal elements of the sensorimotor cortex to stimulation of the middle thalamic center (CM). It is shown that, if inhibitory influences are clearly prevalent in the CM neurons, then facilitating effects are to be found primarily in the VA, especially in response to neocerebellar stimulation. In a few instances, low-frequency stimulation of cerebellar nuclei exerted a synchronizing influence on the spontaneous activity of the nonspecific thalamic neurons. Following low-frequency stimulation of the CM, synchronization of neuronal activity attained a considerable height in the sensorimotor cortex. Inhibitory processes played an especially important role in the reactions of the neurons in the cerebello-(nonspecific)-thalamo-cortical regulatory system—reactions which in a number of cases exhibited a rather complex character.—*I. D. London.*

7547. **Artem'eva, E. N.** (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Krosskorrelyatsionnyi analiz élektromiogramm pri dinamicheskoi rabote.** [Cross-correlational analysis of electromyograms in dynamic activity.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1364-1368. —Used 13 athletes and 10 untrained Ss to determine (a) the degree the patterns of the temporal relationships for the excitatory process are retained in analogous variants involving dynamic activity, and (b) whether they undergo change as the result of training. The temporal relationships were investigated between motor unit discharges in m. biceps brachii and m. triceps brachii during rhythmic extension of the forearm, using cross-correlational analysis of the EMGs. It is shown that in dynamic activity with voluntary strain on both muscle-antagonists any correlation obtained between the discharges of motor units is either absent or weakly expressed. In an activity where only 1 of the muscles underwent voluntary strain, involuntary activity was observed in the antagonist. Between the electrical activity of the agonist and antagonist a considerable correlation was revealed. In athletes, with voluntary strain on 1 of the muscles, the correlation obtained between discharges of the motor units of the muscle antagonists was expressed significantly weaker than in the untrained Ss. (English summary)—*I. D. London.*

7548. **Baranov-Krylov, I. N.** (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **O testirovani sostoyaniya vozбудimosti spinal'nykh tsentrov pary antagonisticheskikh myshts.** [On testing the excitatory state of the spinal centers of a pair of antagonistic muscles.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 889-891. —Presents an EMG study to determine the momentary excitability of the motoneuronal pool of the muscle antagonists: m. soleus and m. tibialis ant., by simultaneous elicitation of the flexor and extensor reflexes (H_1 and H_2 , respectively) of the leg. 1 stimulating electrode was placed in the middle of the patellar pit and the other, to the side of the patellar pit. Data, procured on the H_1 responses, show that H_1 characterized the excitatory state of the flexor motoneuronal pool; while H_2 characterized that of the extensor. The various properties of these responses and the "priming" which occurs before voluntary activation of the flexor constitute evidence for the independent character of the regulatory processes for the agonist and antagonist.—*I. 7549. **Beijk, J.** (U. Amsterdam, Psychological Lab., Netherlands) **De "galvanic skin response," principles en scoring.** [The "galvanic skin response," principles of

scoring.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Jul), Vol. 25(7), 441-450. —The investigation of arousal theories includes the study of the GSR. It has been demonstrated that a linear function can be established between the electrical "conductance" and the number of sweat glands stimulated. The difference between "resistance change" and "change in conductance" as measures of sweat-gland activity is indicated. Since "resistance change" in the skin is generally in an inverse relationship to the amount of voltage, it would assist the standardization of GSR studies to use the "change in conductance" as a measure of the activity of the sweat glands. A description is also provided of the most efficient application of the electrodes. (English summary)—*A. J. Ter Keurst.*

7550. **Buerger, A. A.** (Harvard U.) **A possible biological analogue of the reinforcement control device in self-organizing systems.** *Conditional Reflex*, 1970(Jan), Vol. 5(1), 52-61. —Virtually all self-organizing systems proposed as models for learning require a reinforcement control device. The biological analog of this device has never been clear. Slow (DC) changes in the cortical potential may be correlates of a biological analog of reinforcement control devices. Frequent pairings of novel stimuli with other stimuli eliciting specific responses produce a slow shift and oscillation in the cortical potential. This DC shift and oscillation occurs 1st in the sensory, and then in the motor cortex involved; it may be associated with the decreases or increases which occur in the threshold of cells in these cortical areas. (34 ref.)—*Journal abstract.*

7551. **Clemente, Carmine D.** (U. California, Medical School, Los Angeles) **Comments on the brain as an effector organ for the study of conditional reflexes.** *Conditional Reflex*, 1970(Jul), Vol. 5(3), 153-155. —Briefly discusses findings concerning the conditioning of: low-voltage, fast rhythms associated with behavioral wakefulness and REM sleep, and slow, higher-voltage brain waves associated with slow-wave sleep and internal inhibition. It is concluded that the conditional reflex should also be explored at the neuronal membrane level, and that "the performance of a conditional response or its suppression, mediated through motor horn cells, should be measurable at the membrane level in those final common pathway motoneurons." It is suggested that more study be devoted to "the sequential events in the establishment of a conditional response at this microneurophysiological level."—*M. Maney.*

7552. **Dallos, Peter; Schoeny, Z. G., & Cheatham, M. A.** (Northwestern U., Auditory Research Lab.) **Cochlear summing potentials: Composition.** *Science*, 1970(Nov), Vol. 170(3958), 641-644. —In an experiment with 39 guinea pigs the potential difference across the cochlear partition and the overall potential level of a given cochlear cross section were measured as functions of stimulus parameters and spatial location. Results confirm that the potential difference is negative in the vicinity of greatest excitation, and it was discovered that in the same region the overall potential level is positive.—*Journal abstract.*

7553. **Danilov, G. E.** (Medical Inst., Izhevsk, USSR) **Bioélektricheskaya aktivnost' golovnogo mozga pri khronicheskikh notsitseptivnykh (bolevykh) razdrazheniyakh.** [Cerebral bioelectrical activity following chronic nociceptive (painful) stimulation.] *Fiziologicheskii Zhurnal SSSR*, 1969(Dec), Vol. 55(12), 1444-1449. —Studied the influence of protracted painful

stimulation on the bioelectrical activity of several cerebral structures. Ss were 8 rabbits with electrodes implanted in the sensorimotor cortical area, specific and nonspecific structures of the thalamus, anterior and posterior sections of the hypothalamus, and the mesencephalic reticular formation (MRF). A chronic nociceptive focus was formed by 2 roughened ligatures, applied to the middle third of the sciatic nerve, which were tightened and sutured to the muscles in opposite directions. Protracted painful stimulation led to phasic changes in the bioelectrical activity of the sensorimotor cortical area, thalamus, and the MRF, and depression of hypothalamic activity. In the course of 10-16 days following the creation of the focus of nociceptive stimulation, the electrical activity of the foregoing structures was depressed; but afterwards for 1.5-2 mo. variations in electrical activity occurred from experiment to experiment. Asymmetrical changes and high-amplitude slow rhythm (2-3 cps) appeared in the sensorimotor cortical area; in the thalamus and the MRF regular and irregular rhythm alternated. 2.5-3 mo. after creation of the focus of nociceptive stimulation, a gradual leveling of the observed effects occurred. 7555. Dumbai, V. N., Chebkasov, S. A., & Podladchikova, L. N. (State U., Rostov-on-Don, USSR) **O funktsional'noi role sistemy A-neuronov v zritel'noi kore.** [On the functional role of the A-neuronal system in the visual cortex.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1313-1317.—Used urethanized guinea pigs in an electrocorticographic study of the significance of the role of A neurons in the visual analyzer system through registration of their activity in response to (a) retinal stimulation by means of diffuse light, (b) electrostimulation of the medial nonspecific nuclei of the thalamus, and (c) microelectrode polarization. A neurons constituted 58% of the neurons observed. Subthreshold impulses, occurring from diffuse illumination, did not reach the A neurons of the visual cortex. Given polarization, the presence of a photic reaction in the few cases that do occur can be explained by reference to the heterogeneity of the A neuronal system. It is shown that, against a background of thalamic stimulation, A neurons displayed no reaction to diffuse illumination. It is hypothesized that the "A neurons are an internally heterogeneous group of highly specialized elements which do not participate directly in the analysis of information arriving in the cortex following retinal stimulation by means of diffuse light, but only note its presence through a change of interrelationships." (English summary) (20 ref.)—*I. D. London.*

7556. Efremova, T. M. & Trush, V. D. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Issledovanie chastotnykh spektrov elektrokortikogram pri posloinom otvedenii ot zritel'noi kory krolika v otvet na deistvie ritmicheskogo svetovogo razdrazhatelya.** [Study of frequency spectra of electrocorticograms in recordings by layer from the rabbit

visual cortex in response to the action of a rhythmic photic stimulus.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 839-845.—Utilized over 400 electrocorticographic (ECG) power spectra, supplied by microelectrode recordings from 5-6 different layers of the visual cortex in 7 unanesthetized rabbits. Light flashes lasting 3 or 5/sec for 30-40 sec. at intervals of 5-30 min. were presented. Computation of the ECG power spectra was handled as a Fourier transformation of the correlation function with the aid of the weighted Hamming function. Upper and lower layers of the cortex reacted the same way to the application of a rhythmic photic stimulus: rhythmic assimilation (driving response) appeared immediately when the light was switched on, was manifested within a strictly narrow band, and was maximally expressed in the 1st 10 sec. of its appearance. The fundamental harmonic is maximally expressed; while the higher harmonics generally possess an amplitude, diminished by many times. At the level of 900-1000 microns, there were significant differences in rhythmic assimilation. In most cases, immediately on termination of stimulation, the power spectrum returned to what it was initially. In 13 of 40 cases, traces of the stimulation were retained in all the levels under study for 10-30 sec. When the frequency of rhythmic stimulation was changed during the action of the stimulus, ECG assimilation of the new rhythm was rendered more difficult, possessed a longer latent period, and was less expressed.—*I. D. London.*

7557. Evdokimov, S. A., Zubilov, Yu. N., Saf'yants, V. L., & Syta, Yu. M. (Pavlov Inst. of Physiology, Leningrad, USSR) **Tormozhenie reflektornykh reaktsii na urovne segmentarnykh vstavochnykh neuronov.** [Inhibition of reflex reactions on the level of segmental internuncial neurons.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1342-1347.—Used narcotized cats under curarization in a microelectrode study which recorded: (a) the action potentials of single internuncial neurons of the posterior horn, intramedial region, and ventral horn of the lumbar division of the spinal cord; (b) the potentials of the dorsal surface of the spinal cord; and (c) the reflex discharges of the anterior roots. Reflex stimulation was channeled through the posterior roots of the appropriate segments, or the nerves of the hind legs. With activation of high threshold muscle and skin afferent fibers, the rhythmic reflex discharge in the segmental internuncial neurons was accompanied by lengthy (50-100 msec.) inhibition of the following reflex responses. This inhibition was sustained and deepened with iv injection of strychnine in doses of .08-.20 mg/kg, sufficient for complete suppression of motoneuronal inhibitory postsynaptic potential. Lengthy inhibition was 1 of the mechanisms underlying inhibition of the temporally close polysynaptic reflex reactions, including the contralateral inhibition of the flexor reflex. It is suggested that postexcitatory inhibition in the internuncial neurons (a) enables the detection of the functionally most significant signal from a multiple scatter of arriving impulses, and (b) promotes the formation of a "discrete packet" of impulses for the "transmission of information" to neurons of the following series. (17 ref.)—*I. D. London.*

7558. Fedotova, L. A. (Kirov Medical Inst., Gorki, USSR) **Elektricheskie proyavleniya deyatel'nosti mozga koshki pri perekhode ot bodrstvovaniya ko snu.** [Electrical manifestations of cerebral activity in the cat during transition from the waking state to sleep.]

Zhurnal Vyssheĭ Nervnoi Deyatel'nosti, 1969, Vol. 19(3), 537-539.—Studied the emergence and development of slow ("sleepy") electrical activity in different cortical and subcortical structures of the brain observed in falling asleep. 2 Ss had chronically implanted electrodes in the motor and auditory cortical areas, mediodorsal and centrolateral thalamic nuclei, anterior and posterior hypothalamic regions, and the pontine reticular nucleus. The data suggest that (a) sleep inhibition begins to develop from the subcortical structures with subsequent irradiation to the cerebral cortex, and (b) the cerebral cortex regulates the actional inclusion of the subcortical mechanisms involved in falling asleep and awakening.—*I. D. London.*

7559. Gulyaev, P. I., Zabolot, V. I., & Shlippenbakh, N. Ya. (Leningrad State U., USSR) **Elektroauragrammy cheloveka i zhivotnykh.** [Human and animal electroauragrams.] *Nervnaya Sistema*, 1968, No. 9, 159-171.—Reviews data on the existence and properties of "electrical fields [auras] which arise in space (air) around living objects," where by the term, field, is meant an "external electrical field, formed in space (air) around an object (nerve, muscle, heart) owing to the difference in potentials between excited and unexcited parts on the surface of this object." Data on the following are presented: (a) electrical fields surrounding isolated frog n. ischiadicus and isolated frog nerve-muscle preparation (n. ischiadicus-m. gastroneurii) and frog heart in open rib cage; (b) electric fields, arising around man as a result of heart and muscle activity; (c) low-frequency electrical fields, arising due to movements of insects, birds, and animals. The existence of electromagnetic low-frequency fields around living objects is established. Recordings and measurements of these weak fields are possible through measurement of the electrical component of the adjacent field in the air through the use of contemporary high-impedance quick-acting electrometric amplifiers. Both physiological and physical factors may be involved in the formation of the electrical aura: bioelectrical activity of living tissues, and mechanical oscillations of charged body parts. The activity of living beings is held manifested also in the form of electromagnetic fields generated by them—fields which are spatially propagated far beyond the geometric boundaries of their body.—*I. D. London.*

7560. Kogan, A. B., Efimov, V. N., & Sokolov, P. T. (State U., Rostov-on-Don, USSR) **Analiz dinamiki funktsionirovaniya neirona po zapisi impul'snoi aktivnosti.** [Analysis of the dynamics of neuronal functioning, using impulse-activity recordings.] *Fiziologicheskii Zhurnal SSSR*, 1970(Apr), Vol. 56(4), 514-517.—Presents a mathematical analysis in which impulse activity is viewed as a continuous process, reflecting the functional dynamics of the neuron. A method is proposed for establishing a generalized function of the neuronal state, making use of output impulse current. At the basis of the method lies the construction of a "frequency-gram"—a part-continuous function of time, the values of which at every point are equal to the inverse magnitude of the interimpulse interval.—*I. D. London.*

7561. Kogan, A. B. & Pavlovskaya, N. I. (State U., Rostov-on-Don, USSR) **O perestroikakh aktivnosti neironov zritel'noi kory pri desinkhronizatsii elektrokortikogrammy.** [On readjustment of neuronal activity in the visual cortex of the rabbit during electrocorticographic desynchronization.] *Fiziologicheskii Zhurnal SSSR*, 1969(Dec), Vol. 55(12), 1429-1435.—Ss were

freely moving rabbits with chronically implanted surface electrodes in the motor and visual cortical areas and 2 microelectrodes in the visual area. Electrocorticographic (ECoG) desynchronization was evoked by sensorimotor stimulation (jerking of the paw by a string every 3-5 min.). 410 spontaneously reacting neurons in the visual cortex were recorded and analyzed (250 in the intact visual cortex; 160 in the subsected). 90% of the recorded neurons displayed continuous spontaneous activity and were uniformly distributed in all cortical layers; 10% were discharged by impulse bundles and were located mainly in the deep layers of the cortex. ECoG desynchronization was accompanied by primarily continuous spontaneous reactions of the neurons which have a frequency of succession within the limits of 4-17 impulses/sec and are of both excitatory and inhibitory character in the ratio, respectively, of 2:1. Neurons in the middle cortical layers reacted mainly with excitation, while those in the deep layers with inhibition. Visual cortical subsection did not abolish the propagation of ECoG desynchronization to the subsected cortical area, but it did depress selectively both spontaneous and evoked impulse activity in layers IV and V, while relatively enhancing neuronal activity in the upper layers. The statistical characteristics of the interconnection of the reactional impulse activity of simultaneously recorded neurons did not undergo any essential change after subsection of the visual area—evidence for the significance of the intracortical systems of communication for securing the functional organization of cortical neurons within "working assemblages." 7562. Kopylov, A. G. (Leningrad State U., USSR) **Izmeneniya spontannykh potentsialov neironov bryukhonogikh molliuskov pod vliyaniem depolyarizuyushchego toka.** [Changes in spontaneous potentials of neurons of gastropods under the influence of depolarizing current.] *Nervnaya Sistema*, 1968, No. 9, 81-86.—Snails (*Planorbis corneus* and *Tritonia diomedea*) were used in an intracellular microelectrode study of (a) the spontaneous potentials which arise under the influence of direct transmembrane polarization by means of steady current of different strengths, and (b) the modifications induced in all components of neuronal spontaneous potentials through slow alteration of membrane potential within wide ranges, making use of intracellular depolarization of the neurons by means of steady current. The data are held to confirm Vvedenskiĭ's views concerning the "close genetic connection between local and propagating excitation."—*I. D. London.*

7563. Kotlyar, B. I. & Eroshenko, T. M. (Moscow State U., USSR) **Uslovnoreflektornye perestroiki aktivnosti glyukoretseptorov gipotalamusa.** [Conditioned response reorganization of the activity of the hypothalamic glucoreceptors.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 882-885.—Recorded the activity of 32 neurons from the ventromedial nucleus (VMN) of the rabbit hypothalamus, 14 from the lateral hypothalamus (LH), and 7 from the paraventricular nucleus—the latter serving as controls—in response to sound, light, electrocutaneous stimulation, and intracarotid injections of glucose (4.5% isotonic solution). Since the VMN and LH neurons are specifically sensitive to changes in the concentration of glucose in the blood, recordings were made of the activity of 12 neuronal glucose receptors undergoing functional reorganization

in connection with CR activity. Findings are presented. It is shown that the CR reorganization of VMN and LH neurons attained reinforcement earlier than cortical neurons. The "plasticity" of the glucose receptors appeared to make them suitable for the study of the formation of the conditioned connection at the neuronal level.—*I. D. London.*

7564. Kuntsova, M. Ya. *Izmenenie potentsiala pokoya i kallinoi kontraktury myshtsy kleshni rechnogo raka pri motornoi i tormoznoi denervatsii.* [Change in resting potential and in potassium-contraction of the crayfish claw-muscle following motor and inhibitory denervation.] *Fiziologicheskii Zhurnal SSSR*, 1969(Dec), Vol. 55(12), 1471-1480.—Studied the relationship between (a) polarization level of the fibers in m. adductor and m. abductor of the giant claw of the crayfish *Astacus astacus* L., and (b) the ability of the muscles to develop K-contraction following selective motor and inhibitory denervation of the muscles. After section of the motor and inhibitory nerves, recordings were made of resting potential of the muscle fibers in the claw dactylopodite at various intervals of time thereafter. Parallel recordings were made of K-contraction of m. adductor under isotonic conditions with an increase of K^+ in physiological solution (isoosmotic medium). Following selective motor denervation and intact inhibitory innervation, a phasic development of postoperative changes in resting potential occurred that correlate with alteration of K-contraction. In Phase I (1st-7th day), decrease in resting potential and K-contraction was observed. In Phase II (8th-12th day), against a background of moderate depolarization, K-contraction either increased (22 mM of K^+) or decreased (43 mM of K^+). In Phase III (13th-17th day), with intensification of depolarization and diminution of resting potential, a stable hypersensitivity of the muscle to K^+ developed with the appearance of rhythmic activity. In Phase IV (18th-21st day), resting potential fell to 10-12 mv. (15%), while sensitivity of the muscle to K^+ was maximally raised. In the transitional periods between phases, fluctuations were recorded in depolarization level which were connected with reverse, hyperpolarization changes in resting potential. With selective inhibitory denervation and intact motor innervation, resting potential and K-contraction of m. adductor were significantly reduced. In m. abductor, resting potential changed phasically, with a predominance of hyperpolarization changes at the 5th-16th day of denervation. (English summary) (34 ref.)—*I. D. London.*

7565. Kupperman, Roman. (State U. Utrecht, Netherlands) **ON and OFF responses as measured in the cochlea of the guinea pig.** *Journal of the Acoustical Society of America*, 1970(Feb), Vol. 47(2, Pt. 2), 518-524.—Investigated the "off" response in comparison to the "on" response as a function of several parameters in order to study the neural behavior of the guinea pig cochlea to repetitive tone bursts of different frequencies, starting and ending with several kinds of acoustical transients. In adult guinea pigs it was found that the off response behaved in a way other than the on response when the frequency of the tone burst was varied and the acoustical transient at both ends of the tone burst was kept constant. It appears that the off response is reduced as compared to the on response in the frequency area between 5000 and 9000 Hz. Outside this frequency band, the off response is of the same magnitude as the on response. It is suggested that, in that particular frequency

band, the cochlea of the guinea pig is most sensitive while most of the neural elements appear to be in a refractory state as a consequence of the tonal stimulation.—*Journal abstract.*

7566. Matyushkin, D. P. & Drabkina, T. M. (Leningrad State U., USSR) **Elektrofiziologicheskaya kharakteristika svoistv tonicheskikh volokon vneshnikh glaznykh myshts.** [Electrophysiological characteristics of the properties of tonic fibers in the external ocular muscles.] *Fiziologicheskii Zhurnal SSSR*, 1970(Apr), Vol. 56(4), 563-569.—Presents an intracellular microelectrode study of the properties of more than 100 tonic muscle fibers (slow fibers constantly participant in tonus) of m. obliquus superior in the external ocular musculature of the rabbit. Membrane resting potential of the tonic, multiply innervated fibers of m. obliquus superior came up, on the average, to 32 mV.; the amplitudes of postsynaptic potentials, creating tonus, to about 11 mV. Times of $1/2$ -life of postsynaptic potentials varied from 1.4-8.5 msec. in various fibers (in synaptic regions). In many cases, 2 kinds of postsynaptic potentials emerged in the same tonic fiber (in adjacent synapses)—faster (spike-like) and slower potentials. Groups of gamma-motoneurons, innervating the same tonic fiber, most often functioned in a display of independent rhythms. It is thus shown that many tonic fibers of the oculomotor apparatus include in themselves "heterogeneous and relatively independent compact motor neurons," i.e., neurons somewhat differing with respect to velocity and somewhat independent in rhythm of activity. (English summary) (18 ref.)—*I. D. London.*

7567. Meliya, A. S. (Inst. of Physiology, Tbilisi, USSR) **Vliyanie prodol'no deistviyushchei vibratsii raznykh parametrov na retseptory myshts.** [Influence on muscle receptors of parametrically different, longitudinally acting vibrations.] *Fiziologicheskii Zhurnal SSSR*, 1970(Apr), Vol. 56(4), 589-596.—Studied the character of afferent impulsion from the receptors of isolated frog toe muscles, subjected to the action of parametrically different vibrations (sinusoidal and rectangular vibrations of various frequencies and amplitudes), in order to investigate the influence on CNS activity of vibration acting on different parts of the torso or the whole organism. Vibration, acting on the muscle, produced various response reactions by the muscle receptors (the reactions being a function of magnitude of initial stretching of the muscle): the greater the magnitude of the initial stretching of the muscle, the lower the amplitudinal thresholds of vibration, and the greater the frequency and number of discharges. It is suggested that, when the extremities are subjected to the action of vibration, impulsion, arriving in the CNS, is of varied character, being a function of muscle tension and of the parameters of vibration. Judging by the number and frequency of impulses, the most effective vibrations, as regards action on the brain, are those of comparatively moderate frequency (from 4-5 to 20-30/sec). It is also concluded that the number and frequency of discharges is, to a considerable degree, determined by the property of muscle tissues to conduct mechanical vibration. (English summary)—*I. D. London.*

7568. Meshcherskii, R. M. (Inst. of Higher Nervous Activity & Neuropsychology, Moscow, USSR) **Korotkolatentnye otvety retikulyarnogo yadra talamusa koshki na vspyshku sveta.** [Short-latency responses of the reticular nucleus of the cat thalamus to a light flash.] *Fiziologicheskii Zhurnal SSSR*, 1966(Feb),

Vol. 52(2), 125-130.—A bright light flash (50 microsec.) produced in the thalamic reticular nucleus 2 types of responses which preceded the response of the visual tract. 12 nembutalized cats served as Ss. The 1st type of pretract responses occurred independently of the lateral geniculate body responses, had a latent period of 7-12 msec., and had a positive-negative phasic sequence. The 2nd type of pretract responses represented the initial component of the lateral geniculate body responses or of visual radiation occurring several msec. earlier than the response of the visual tract. Responses of the 2nd type were recorded from those parts of the reticular nucleus which directly adjoin the lateral geniculate body. It is suggested that the pretract responses of the thalamus are an electrotonic expression of the dipole oscillations of the retinal ganglionic cells, emerging as the result of their inhibition during the development of Wave a in the electroretinograph. Similar electrotonic influences may transmit to the central divisions of the brain information about the imminent arrival of an afferent volley. A corresponding adjustment of the specific projection pathways of the analyzer may be brought about by means of a corticofugal system of connections.—I. D. London.

7573. Requin, J. & Granjon, M. (Inst. of Neurophysiology & Psychophysiology, Marseille, France) **Relation entre le niveau d'excitabilité médullaire et la probabilité conditionnelle d'apparition du signal d'exécution pendant la période préparatoire à une réponse motrice.** [Relation between levels of medullary excitability and the conditioned probability of the appearance of a signal of performance during the preparatory period to a motor response.] *Canadian Journal of Psychology*, 1969(Oct), Vol. 23(5), 347-365.—Many experimental facts confirm the hypothesis that the relation between the duration of the preparatory period, and the performance level obtained in an RT situation, partly depends on the conditional probability of the response signal. This study shows that the effects of such a variable appear in physiological changes accompanying the preparatory sets, especially the excitability of the spinal motor structures. The level of spinal excitability has been tested by the monosynaptic reflexes method, with Ss placed in a simple RT situation, during the period separating the preparatory from the response signal, or the preparatory signal from the preceding response. In both procedures the interval explored was systematically varied and the time uncertainty concerning the moment of occurrence of the awaited signal was rendered independent of the duration of the interval by the use of a periodic stimulus acting as a time mark. A positive relation was observed between the duration of the variable interval and the amplitude of the spinal reflexes. It was identical in the 2 procedures when exploration concerned a muscle which was not involved in carrying out the response. The development of the spinal excitability level for the muscle involved in carrying out the response differs according to the meaning of the awaited signal: it grows during the interval between the trials. Results show the double aspect of the preparatory phenomena, of activating and generalized nature and, of lowering and focused nature. The hypothesis is confirmed in both cases. (20 ref.) —*English summary.*

7574. Shabonov, A. I. (Leningrad State U., USSR) **Vliyaniye myshechnogo utomleniya na élektricheski vyzvannyye otvety spinnoy mozga cheloveka.** [Influence of muscular fatigue on electrically evoked responses in the human spinal cord.] *Nervnaya Sistema*, 1968, No. 9, 120-126.—5 25-30 yr. old Ss were used to study the influence of voluntary exercise of the ulnar flexor of the weighted right hand (3 kg., 80 flexions/min) on the characteristics of the F response. Investigation of the late response (in the evoked EMG and identified with the F response), resulting from stimulation of the ulnar nerve, shows, on the basis of recordings from the ulnar flexor of the hand after unaccustomed muscular activity until stopping, that the F response disappeared immediately after the muscular performance. The character of F response restoration was not the same for all Ss. The M response remained relatively constant. It is suggested that the disappearance of the F response was due to a change in the activity of the muscle receptors.

7575. Shul'gina, G. I. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Reaktssii**

neironov kory golovnogo mozga krolika na rannei stadii vyrabotki oboronitel'nogo uslovnogo refleksa na ritmicheskii svet. [Reactions of neurons in the rabbit cerebral cortex in the early stage of elaborating a defensive conditioned response to rhythmic light.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 778-787.—Recorded the reactions of 16 cortical motor neurons and 11 cortical sensorimotor neurons in alert mobile rabbits to study (a) the early formation of a new CR system of neurons, and (b) the relationship of the inhibitory and excitatory processes in the elaboration of conditioned connection. The DCS was rhythmic flashes of light (1 or 3/sec), and the UCS was isochronic suprathreshold electrodermal stimulation of the extremity. The relative degree of the activation and inhibitory phases in the reactions to unreinforced flashes was dissimilar in different neurons of the visual cortex and in single neurons could undergo modification depending on the number of repetitions in series. In most neurons of the visual and sensorimotor cortex, linkage of electrodermal stimulation of the extremity to the light flash either did not change the reaction to light or produced weakening of its inhibitory and enhancement of its excitatory components. The reactions of single neurons in the visual and sensorimotor cortex to rhythmic light after its pairing with electrodermal stimulation of the limb changed in the direction of increase in the similarity of responses to paired stimuli.—I. D. London.

7576. Timko, N. A. (Inst. of Gerontology, Kiev, USSR) *Vozrastnye izmeneniya skorosti provedeniya vzbuzhdeniya po motornym voloknam perifericheskikh nervov*. [Age-specific changes in the conduction velocity of excitation along motor fibers of the peripheral nerves.] *Fiziologicheskii Zhurnal SSSR*, 1970(Apr), Vol. 56(4), 552-557.—83 Ss in 3 age groups (18-32, 60-74, and 75-89 yr.) were studied to determine (a) the maximal conduction velocity of excitation in the ulnar and peroneal nerves, (b) the amplitude and duration of action potential of the abductor muscle of the little finger and the short extensor of the toes, and (c) residual conduction time. An attempt was made to determine whether the changes in all these parameters with age follow the same pattern, and whether the degree of these age-specific changes is the same in the upper and lower extremities. It was found that maximal conduction velocity of excitation was lower in the distal part of the ulnar nerve than in the proximal for all age groups. Conduction velocity of excitation diminished with age to a greater degree in the peroneal nerve than in the ulnar. There were age-specific differences in residual time in the upper and lower extremities. Age-specific changes in amplitude of muscle action potential was expressed in greater degree in the lower extremity than in the upper. Duration of muscle action potential increased with age only in the lower extremity. (English summary) (33 ref.)—I. D. London.

7577. Ungiadze, A. A. & Oniani, T. N. (Inst. of Physiology, Tbilisi, USSR) *O dinamike fonovoi elektricheskoi aktivnosti dorsal'nogo i ventral'nogo otdelov gippokampa koshki*. [On the dynamics of spontaneous electrical activity in the dorsal and ventral regions of the cat hippocampus.] *Fiziologicheskii Zhurnal SSSR*, 1970(Apr), Vol. 56(4), 535-542.—Cats were employed in a study of the changes in the electrical activity of the dorsal and ventral regions of the hippocampus (especially theta activity) during various

kinds of conditioned and unconditioned motivated behavior (alimentary-motor CRs) and also in response to electrical stimulation of the different hypothalamic nuclei. Under the influence of an acoustic UCS, eliciting an orienting reaction without emotional coloration, desynchronization and inhibition of all the slow EEG rhythms were observed in both the dorsal and ventral regions of the hippocampus. Conditioned acoustic stimulation brought about intensification of theta rhythm in both the dorsal and ventral regions of the hippocampus. Theta rhythm displayed a parallel development in the 2 regions during the paradoxal stage of sleep. A sharp intensification of theta rhythm in the 2 regions was observed under the influence of electrical stimulation of the lateral parts of the hypothalamus, eliciting the activation of alimentary behavior. Stimulation of the hypothalamic ventromedial nucleus, producing inhibition of alimentary behavior, simultaneously brought about an intensification of delta rhythm in the dorsal and ventral regions of the hippocampus. Intensification of theta rhythm in motivated behavior was not recorded in all layers of the hippocampus. It was evidently connected with activation of the cellular layer. This probably explains the absence of theta rhythm in the ventral region of the hippocampus. (English summary) (32 ref.)—I. D. London.

7578. Val'tsev, V. B. & Lalayan, A. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) *K voprosu o mekhanizmax funktsional'noi perestroiki v raznykh zven'yakh zritel'nogo analizatora v usloviyakh dlitel'noi svetovoi stimulyatsii*. [On the mechanisms of functional reorganization in various links of the visual analyzer when photic stimulation is lengthy.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 853-861.—Used 14 narcotized cats in a comparative study of the temporal and amplitudinal characteristics of the off response in the optic tract, lateral geniculate body (LGB), and visual cortex. A range of intensities was chosen in which retinal reactions were a linear function of the logarithm of signal intensity. Under nonbrief photic stimulation, along with an increase in excitation in the upper visual analyzer due to the elimination of retinal inhibitory effects, centrifugal inhibitory influences were probably exerted on processes in the LGB from the cortex. After nonbrief photic stimulation (.5, 1.2, 5 sec.) evoked potential was found to be a linear function of the logarithm of brightness of the preceding illumination in the optic tract and a nonlinear inverse tending function in the LGB and visual cortex. The absence of similar differences with brief illumination indicates that the processes characterize the specific way in which the different levels of the visual system function when nonbrief photic stimulation is applied. The cortex is capable of changing the temporal characteristics of evoked potential over a considerably greater range in comparison with the LGB; as a result of which the rate and time of development of evoked potential in the cortex may lag behind and run ahead of evoked potential in the LGB, and the relationship of the processes in the LGB and the visual cortex may undergo sharp change. It is suggested that this cortical property may depend on processes in the dendrites, and the participation of the thalamic reticular formation. It is also suggested that, with nonbrief photic stimulation, there are some processes, connected with the generation of the primary response in the LGB, which are evidently not connected

with the transmission of information to the visual cortex.—I. D. London.

(Leningrad State U., USSR) **Elektrotonicheskie izmeneniya v kozhe i myshitse.** [Electrotonic changes in skin and muscle.] *Nervnaya Sistema*, 1968, No. 9, 151-158.—Data are adduced which demonstrate the similarity of the polarization-depolarization effects developing in skin, nerve, and muscle tissues. These constitute evidence for the generality of nonspecific electrotonic effects in different living tissues.—I. D. London.

7580. Veselkin, N. P. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) **Elektrotonicheskie reaktsii v srednem, prodolgovatom i spinnom mozgu minogi pri zritel'noi stimulyatsii.** [Electrical reactions in the midbrain, medulla oblongata and spinal cord of the lamprey to visual stimulation.] *Fiziologicheskii Zhurnal SSSR*, 1966(Feb), Vol. 52(2), 131-136.—38 river lampreys (*Lampetra fluviatilis*) served as Ss and 50-microsec light flashes were utilized. Sufficiently intense visual stimulation evoked in Ss an efferent motor volley, which was propagated along mesencephalo- or bulbospinal pathways. The components of the tectal mesencephalic response are divided into 2 groups: (a) those resulting from the activity of retinal elements, reacting to the light coming on; and (b) those from the activity of elements, reacting to its being turned off.—I. D. London.

7581. Voronin, L. L. & Solntseva, E. I. (Inst. of the Brain, Moscow, USSR) **Sledovye efekty posle polarizatsii otdel'nykh neuronov kory: Vnutrikletochnoe otvedenie.** [Trace effects after polarization of single cortical neurons: Intracellular recording.] *Zhurnal Vysheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 828-838.—Utilized intracellular recordings of 18 neurons plus "partially intracellular" recordings of 61 neurons in the sensorimotor cortex of nonanesthetized rabbits in a study of the trace effects on frequency, arising after switching off the polarizing current passed through the recording microelectrode. Slow adaptive changes in discharge frequency were observed due to the action of electric current. After switching off a depolarizing current, inhibitory aftereffects occurred in all intracellularly recorded neurons, while activating aftereffects occurred following a hyperpolarizing current. The duration of trace effects increased in duration and strength of current and attained 10 sec. for intracellular recordings. In the case of intracellular recordings no substantial changes were noted in average level of membrane potential in the afteraction. In the case of "partially intracellular" recordings, changes in recorded steady potential were noted, following the switch off of polarizing current. However, these changes are the result of displacements of the cellular membrane relative to the microelectrode, and not to true changes in membrane potential. No substantial changes in spontaneous synaptic "bombardment" or in postsynaptic potentials were found. In most cells during inhibitory afteraction large depolarizing oscillations were observed which produced no spike discharges.—I. D. London.

7582. Zarkeshv, E. G. (Pavlov Inst. of Experimental Medicine, Leningrad, USSR) **Metodika vnekletochnoi registratsii neuronnoi aktivnosti v kore golovnogo mozga v usloviyakh khronicheskogo eksperimenta pri svobodnom nefiksirovannom sostoyanii zhivotnogo.** [Method for extracellular registration of neuronal activity in the cerebral cortex under conditions

of chronic experiment with the animal in a free nonfixated state.] *Zhurnal Vysheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 895-898.—Presents details concerning the modification and operation of microelectrode apparatus, in order to record the spike activity of cortical neurons in freely moving cats under conditions of chronic experiment. Experiments show that recording time for single neurons is 15-45 min.—I. D. London.

7583. Zilov, V. G. (1st Medical Inst., Moscow, USSR) **Vzaimodeistvie korkovykh i retikulyarnykh vliyaniĭ na neuronakh lateral'nogo gipotalamusa.** [Interaction of cortical and reticular influences on the lateral hypothalamic neurons.] *Fiziologicheskii Zhurnal SSSR*, 1969(Dec), Vol. 55(12), 1436-1443.—In view of the important role which the cortical level and parts of the mesencephalic reticular formation (MRF) play in cerebral integrative activity, 20 cats under chloralose narcosis were studied to determine the influences exerted by these structures on the activity of 290 neurons in the lateral sections of the hypothalamus, involved in the formation of emotional and motivational states in the organism. Changes in cellular activity were investigated through electrostimulation of the 1st sensorimotor area and the MRF. In order to study the convergence of different excitatory influences in the hypothalamic neurons, stimulation of the sciatic nerve was employed along with light and sound. 75% of the neurons displayed a low level of spontaneous activity (up to 5 impulses/sec). Changes in cellular activity under the action of diverse stimulation provide evidence for the great ability of hypothalamic neurons to handle the convergence of influences, as seen by the fact that only 10% of the neurons, investigated to establish convergence, failed to respond to any of the presented stimuli. Lateral hypothalamic neurons, responding to stimulation, were inhibited by corticofugal impulses from the 1st sensorimotor area and the MRF. Definite confirmation of the dominating influence of either the cortex or the MRF was not possible. Cortical influence was predominant in 28.7% of the neurons; MRF influence (chiefly inhibitory in character) in 32.5%; in the remaining 38.8%, joint corticoreticular action exerted a "resultant influence," distinct from the effects observed on isolated stimulation of the cerebral cortex or the MRF—I that is mainly excitatory. (English summary) (21 ref.)—I. D. London.

7584. Alekseev, M. A. & Dobronravova, I. S. (Inst. of Higher Nervous Activity & Neuropsychology, Moscow, USSR) **Generalizovannye reaktsii vysshikh otdelov mozga cheloveka pri vyrabotke sistemy posledovatel'nykh dvigatel'nykh reaktsii.** [Generalized reactions of the higher divisions of the human brain during elaboration of a system of sequential motor reactions.] *Zhurnal Vysheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 816-827.—Presents an EEG study of a temporal and rhythmic sequential system of conditioned connections widely represented in human motor activity. Repetition of a simple movement in connection with the rhythmic repetition of an external signal (a model with 2 interacting CRs: 1 to an external stimulus; the other to the time of its application) was employed. EEG recordings were made of the acoustic and motor regions of the contralateral hemisphere with respect to the hand, for which a motor reaction (CS: click in 1 ear; CR: key-pressing producing a click in the other ear) was

elaborated along with a GSR for the other hand. It is found that extinction of the GSR is associated more with the formation of a stable system of sequential connections. On the contrary, the emergence of a GSR was connected with the instability of a system in its formative period either during its restoration, if it was disturbed, or as a result of weakness of the systemic processes. The GSR reflects primarily changes in the dominating conditioned connection in the system. Correction of slight changes in the system may not be accompanied by a GSR.—*I. D. London.*

7585. **Giannitrapani, Duilio.** (Michael Reese Hosp., Psychiatric & Psychosomatic Inst., Chicago, Ill.) **EEG changes under differing auditory stimulations.** *Archives of General Psychiatry*, 1970(Nov), Vol. 23(5), 445-453.—Investigated amplitude changes and phase angle relationships between 16 brain areas for frequencies from 1-33 cps. Ss were 32 11-14 yr. old right-handed boys. Besides 2 resting control periods, 3 auditory conditions were used, 1 unpatterned (white noise), a musical excerpt, and a story. The 3 conditions showed similarities in the patterning of EEG data and distinctive features characteristic of each condition. Similarities consisted of amplitude changes primarily in the prefrontal-to-occipital and homologous temporal comparisons. The noise condition was characterized by left temporal increase in beta activity and anterior leading of alpha in the left prefrontal-to-occipital comparison. Music was characterized by the smallest change in amplitude from resting, bilaterally symmetrical leading in the prefrontal-to-occipital comparisons, and anterior leading in the left central-to-occipital comparison. Voice was characterized by a bilateral increase of beta activity in the temporal areas and posterior leading of alpha in the left prefrontal-to-occipital comparison. Both the music and voice test conditions showed a decrease in the left leading activity characteristic of the resting condition in this right-handed group, but in slightly different beta frequency bands. Findings indicate both the specificity and the generality of the mediation of auditory processes in the human brain. (15 ref.)—*Journal summary.*

7586. **Itil, T. M.** (U. Missouri, Medical School, St. Louis) **Digital computer analysis of the electroencephalogram during rapid eye movement sleep state in man.** *Journal of Nervous & Mental Disease*, 1970(Mar), Vol. 150(3), 201-208.—Investigated whether the scalp-recorded EEG pattern of REM sleep (paradoxical sleep) can be discriminated from the drowsiness state and awakening state. Visually identified, artifact-free, digital computer-analyzed EEG samples of these 3 stages were compared for each of 7 volunteers and for the entire group. Statistical evaluation (analysis of variance and discriminant function) of the quantitative EEG measures demonstrated that the REM period is characterized by a low voltage EEG with less alpha activity and more slow and very fast activity than the awakening and the drowsiness states. Since these kinds of EEG alterations have been observed, particularly after anticholinergic hallucinogenic drugs, and since the increase of fast activity during anticholinergic drug-induced delirium is related to an increase of perceptual disturbances, a relationship between increased fast waves and an increase of mental activity during sleep (dream) has been postulated. (35 ref.)—*Journal abstract.*

vzaimodeistviya sensorno razobshchennykh ispytuemykh metodom uslovykh refleksov. [Electroencephalographic study of the interaction of sensorially isolated Ss by conditioned response method.] *Nervnaya Sistema*, 1968, No. 9, 172-176.—2 Ss (a percipient and an inductor—each 21 yr. old) were isolated from each other in 2 soundproof rooms. For the inductor there was simultaneous light from 60-W bulb and electrocutaneous stimulation of fingers of the right hand for 10 sec.; for the percipient the procedure was the same except duration was for 5 sec. only and started 5 sec. later. CR procedures were then applied to determine whether "any information was transmitted from the inductor to the percipient" in the process of forming a "passive-defensive" CR. In the process, continuous recording of the percipient's EEG was undertaken together with registration of an actogram for determination of EEG artifacts. As the number of pairings for elaboration of the CR increased, the biphasic reaction in the percipient's EEG, following unconditioned stimulation of the inductor, developed more and more in the direction of significance, pointing to the formation of a conditioned connection. Control experiments, conducted in the absence of an inductor, disclosed no statistically significant changes in the percipient's EEG.—*I. D. London.*

7589. **Osterhammel, P., Terkildsen, K., & Arndal, P.** **Evoked responses to SISI stimuli: Contralateral masking effects.** *Acta Oto-Laryngologica*, 1969(Jun), Suppl. 263, 245-247.—In an experiment with 3 Ss, it was found that evoked cortical responses to Short Increment Sensitivity Index type stimuli at 20-db sensation level and increment magnitudes 2, 3, and 5 db. tended to be enhanced by the application of contralateral masking noise. With 5-db increments and the continuous tone at the threshold of hearing, the same masking noise caused the response to disappear. The enhancement of auditory discrimination at suprathreshold levels through application of contralateral masking and the central masking effect at the threshold are thought to be comparable to the so-called indirect adaptation mechanism of the eye, and an indication that the efferent innervation to the cochlea is important for the adaptation of the ear.—*Journal abstract.*

7591. **Blackwell, Roger D., Hensel, James S., & Sternthal, Brian.** (Ohio State U.) **Pupil dilation: What does it measure?** *Journal of Advertising Research*, 1970(Aug), Vol. 10(4), 15-18.—Pupil dilation is 1 of the objective measures adopted "as a useful predictor of human behavior without thoroughly investigating the technique" according to this evaluative review. There is "some doubt... as to what psychological processes... are being monitored by pupillary responses." The authors' current impression is that pupillary dilations

accompany any substantial increase in mental activity, regardless of the pleasantness of this activity."—J. C. Franklin.

7592. Bykov, K. A. & Funtikov, B. A. (Leningrad State U., USSR) *Issledovanie perekhodnykh protsessov v setchatke lyagushki*. [Study of transitory processes in frog retina.] *Nervnaya Sistema*, 1968, No. 9, 141-150.—Studied transitory processes in the beginning periods of dark and light adaptation, utilizing the immobilized whole eye of the frog and a 2-channel optic adequatometer, capable of changing by channel the duration and intensity of optic stimuli over a wide range and the interval between them. It is shown that under similar conditions of stimulation, "small resolving power of the retina" is due to the duration of the transitory processes and does not characterize the potentialities of the system. In order to assess the true resolving power, stimulation of different parts of the retina is necessary.—I. D. London.

7593. Collins, W. E. & Updegraff, B. P. (FAA, Civil Aeromedical Inst., Oklahoma City, Okla.) *Possible interactions between gravi-receptors and semicircular canals in the habituation of vertical nystagmus in parrots*. *Acta Oto-laryngologica*, 1970(Apr), Vol. 69(4), 257-265.—Horizontal ocular nystagmus in 6 restrained African parrots was habituated in a directionally specific fashion by repeated angular accelerations. Substantial response recovery was evident following 2 wk. of rest. Vertical nystagmus was similarly habituated in 16 dwarf parrots who were positioned so that vertical semicircular canals were in the plane of rotation. By changing the position of these Ss 180° after the habituation trials, the same set of vertical canals could be stimulated but with the otoliths and other gravireceptors oriented differently. Habituation was relatively specific for the direction of nystagmus repeatedly elicited and for the head and body position maintained during habituation trials. A dynamic interaction between gravireceptors and the semicircular canals is suggested as a possible feature of nystagmic habituation. (French & German summaries) (20 ref.)—*Journal abstract*.

7597. Karlovich, Raymond S. & Luteran, Barry F. (U. Wisconsin) *Application of the TTS paradigm for assessing sound transmission in the auditory system during speech production*. *Journal of the Acoustical Society of America*, 1970(Feb), Vol. 47(2, Pt. 2), 510-517.—Investigated the relations between speech production and sound transmission by employing a temporary threshold shift (TTS) paradigm. 10 males and 10 females were exposed to a 100-db SPL 1000-Hz fatigue stimulus for 3 min. During the exposure time, the Ss repeatedly produced a voiced vowel, a whispered vowel, or a nonvoiced articulatory gesture representing a vowel without whispering. Pre- and postexposure thresholds were tracked with a Békésy-type procedure for a stimulus 1/2 oct. above the fatigue frequency. TTS following voiced /a/ and /i/ vowel conditions was significantly less than that observed for corresponding whispered or nonvoiced conditions at each postexposure recovery time measured. The magnitude of these differences ranged from 9 db. at 10 sec. to 4 db. at 3 min. of recovery. Results strongly indicate that voiced vowel production impedes transmission, reducing the energy delivered to the cochlea from a 1000-Hz fatigue stimulus. 2 potential mechanisms are proposed to account for alteration in sound transmission during voiced vowel production: (a) possible middle-ear muscle contraction, and (b) alterations in the normal vibratory mode of the stapes caused by vertical vibrations of the skull during phonation.—*Journal abstract*.

(Kirov Military-Medical Academy, Leningrad, USSR) *Vliyanie intensivnoi dezadaptiruyushchei fotostimulyatsii na kharakter vosstanovleniya svetovoi chuvstvitel'nosti zritel'nogo analizatora cheloveka*. [Influence of intense disadapting photostimulation on the character of restoration of photic sensitivity of the human visual analyzer.] *Fiziologicheskii Zhurnal SSSR*, 1970(Apr), Vol. 56(4), 558-562.—8-9 Ss participated in a study of the action of intense photic stimuli (250-1600 candle sec.) of brief duration (80-900 microsec.) on the degree of decrease and speed of restoration of photic sensitivity of the analyzer under conditions of complete dark adaptation. The determining factor in the action of such stimuli is their energy. However, with decrease in duration of the light flash, the character of the relationships underwent change. The law that the "identity of action of stimuli on the visual analyzer is the same, given fulfillment of the condition $I \cdot t = \text{const.}$ " holds within the bounds of the investigated parameters of the brief superintense photic stimuli, but with certain deviations in the beginning period of dark adaptation. Time of full restoration of photic sensitivity was not a function of intensity of the photic stimulus. The warp in

the curve of dark adaptation could not be completely explained by the transition from photopic to scotopic vision. (English summary) (24 ref.)—*I. D. London.*

7600. Steinberg, Roy H. **Rod and cone contributions to S-potentials from cat retina.** *USN AMI Army-Navy Joint Report*, 1969(Jun), No. 1071, 13 p.—Studied whether the rods contribute to stimulus (S)-potentials in the intact eye of the cat. S-potentials from luminosity units were evoked by small spots of monochromatic light in dark- and light-adapted retinas. The spectral sensitivity curve for dark-adapted S-potentials had its maximum at 500 nm., and the form of dark-adapted responses suggested that rods were excited. The spectral sensitivity curve for light-adapted S-potentials had its maximum at 560 nm., and response latencies even at threshold were faster than in dark adaptation. Individual S-potentials exhibited Purkinje shifts. It is concluded that rhodopsin rods contribute to S-potentials in the cat and that cones contribute to the same responses. (40 ref.)—*Journal abstract.*

7601. Steinberg, Roy H. **Rod-cone interaction in S-potentials from cat retina.** *USN AMI Army-Navy Joint Report*, 1969(Jun), No. 1072, 17 p.—Studied rod-cone interaction in cat stimulus-potentials by analyzing the effect of wavelength and intensity upon the form of dark-adapted responses. Flashes of white light and relatively monochromatic flashes produced responses that seemed to originate from the excitation of both receptor types. The rod response changed as a function of intensity. The cone response added to the changing rod response. Both ceilings were obscured by the apparent addition of the cone contribution. Cone and rod responses to brief orange and blue lights of moderate intensity, separated in time, added together across a complete range of intervals. (16 ref.)—*Journal abstract.*

7602. Steinberg, Roy H. **The rod after-effect in S-potentials from cat retina.** *USN AMI Army-Navy Joint Report*, 1969(Jun), No. 1075, 13 p.—Studied the relation of the rod aftereffect to percentage rhodopsin bleached in stimulus potentials from cat retina. At threshold, flashes which produced the rod aftereffect bleached only very small quantities of rhodopsin; and at a fixed flash duration, the duration of the aftereffect increased as a function of log intensity. The aftereffect's threshold occurred at about the intensity which saturated the maintained voltage. With flash intensity fixed and flash duration increased the duration of the aftereffect was a linear function of exposure time. The duration continued to increase after a 16-sec exposure, even though at least 99% of the rhodopsin was bleached. It is concluded that the aftereffect originates from something which accumulates after the maintained voltage in rod pathways reaches a ceiling. The accumulation can continue at a fixed rate irrespective of the bleaching rate. (15 ref.)—*Journal abstract.*

7603. Tonndorf, Juergen. (Columbia U.) **Nonlinearities in cochlear hydrodynamics.** *Journal of the Acoustical Society of America*, 1970(Feb), Vol. 47(2, Pt. 2), 579-591.—Presents an account of findings with mechanical cochlear models in investigations of the role of hydrodynamics in nonlinear cochlear waves. Relevant principles of hydrodynamics are discussed and model findings indicated which "may explain a number of auditory and/or electrophysiological phenomena: (a) an amplitude-independent asymmetrical displacement that for appropriate signals leads to demodulation; and (b) an

amplitude-dependent event, Békésy's eddies, that leads to harmonic distortion." An attempt is made to correlate the findings with those obtained from different types of studies. (43 ref.)—*S. Knapp.*

7605. Altschuler, Henry, et al. (Gerontological Research Inst., Philadelphia, Pa.) **Neurochemical changes in the brains of albino rats as related to aversive training.** *Journal of Biological Psychology*, 1969(Dec), Vol. 11(2), 33-38.—Describes research on the relationship between neurochemistry and learned behavior (aversive training) of albino rats. A donor-recipient transfer yielding positive results is described. Chemical analyses of the donor brains (total cerebral homogenate) indicate that with avoidance training, quantitative increases in RNA and protein were found, and significant correlations occurred between donor RNA, protein and total nitrogen, and recipient extinction learning. Using escape training, with a 2-hr posttraining sacrifice interval, significant increases in brain protein and significant decreases in nonprotein nitrogen were noted. Chemical analyses were performed on a total brain homogenate of the cerebrum, brainstem, and cerebellum. Age differences were found for RNA and significant correlations were found between the chemical constituents and extinction behavior for both young and aged Ss. (23 ref.)—*Journal abstract.*

7606. Azmitia, E. C., Algeri, S., & Costa, E. (Rockefeller U.) **In vivo conversion of ³H-L-tryptophan into ³H-serotonin in brain areas of adrenalectomized rats.** *Science*, 1970(Jul), Vol. 169(3941), 201-202.—Adrenalectomized male Sprague-Dawley rats 10 days before the in vivo conversion index was estimated of ³H-tryptophan into radioactive serotonin in brainstem and telencephalon. It was found that the conversion index in the brainstem of adrenalectomized Ss was smaller than in the same area of sham operated Ss. Conversely, the conversion index in the telencephalon was similar in the 2 groups. The serotonin concentrations were unchanged by adrenalectomy, which suggests that in brainstem the decrease of tryptophan hydroxylase is reflected by the conversion index estimation and not by measurement of serotonin steady-state concentrations. (18 ref.)—*Journal abstract.*

7607. Baumel, Irwin; DeFeo, John J., & Lal, Harbans. (U. Rhode Island) **Alterations in brain sensitivity and barbiturate metabolism unrelated to aggression in socially deprived mice.** *Psychopharmacologia*, 1970, Vol. 18(3), 320-324.—Swiss albino Charles River Farms random-bred mice deprived of social interactions showed increased resistance to hexobarbital narcosis. However, only isolated males developed aggressiveness. The more rapid disappearance of hexobarbital from the whole body of isolated Ss and the higher drug concentration at awakening indicate enhanced hepatic deg-

radation with a concomitant increase in CNS excitability. Development of aggressiveness in isolated male Ss did not correlate temporally with the reduced response to hexobarbital. Data suggest that alterations in barbiturate sensitivity and development of aggressiveness following social deprivation have different biological bases. (18 ref.)—*Journal abstract.*

7608. Cohen, Alan. (Foundation for Research on the Nervous System, Boston, Mass.) **Effects of whole brain homogenate on transfer of information in rats.** *Journal of Biological Psychology*, 1969(Dec), Vol. 11(2), 27-29.—Injected 13 male albino Charles River rats intracranially with whole brain homogenate from rats that were warned by a buzzer to avoid a bright light. Recipients of trained brain tissue exhibited the same avoidance response when subjected to the buzzer alone. Controls receiving untrained brain homogenate injections or no injections did not respond to the buzzer as frequently.—*Journal abstract.*

(Medical School, Bialystok, Poland) **The influence of somatotropin on the chlorpromazine distribution in rat tissues.** *Agressologie*, 1969(Sep), Vol. 10(5), 391-397.—Experiments in vivo show that simultaneous administration of somatotropin (STH) and chlorpromazine enhances the accumulation of the latter in the liver and muscle tissues. 100 healthy and 20 hypophysectomized male Wistar rats served as Ss. In hypophysectomized Ss the level of chlorpromazine in the lung, brain, liver, and muscle was decreased. Administration of STH 15 min. prior to chlorpromazine, elevated 2-fold the drug level in the brain tissue. This effect was not observed in diabetic Ss. In the experiments in vitro STH increased the rate of chlorpromazine penetration into the liver slices. Transport effects of STH are attributed to its direct effect (liver, muscle) and upon its indirect action (brain). (French, German, Spanish & Russian summaries) (33 ref.)—*Journal abstract.*

7611. Fjerdingstad, E. J. (U. Tennessee Medical Units, Brain Research Inst., Memphis) **Memory transfer in goldfish.** *Journal of Biological Psychology*, 1969(Dec), Vol. 11(2), 20-25.—Trained goldfish to avoid shock in a water-filled shuttle box with light as the CS. RNA extracts prepared from such trained donors and injected intracranially into naive recipients caused Ss to respond significantly more often to unreinforced presentations of the stimulus light than did recipients of extract from naive brains.—*Journal abstract.*

7612. Gaito, John & Bonnet, Kenneth. (York U., Toronto, Ontario, Canada) **Quantitative versus qualitative RNA and protein changes in the brain during behavior.** *Psychological Bulletin*, 1971(Feb), Vol. 75(2), 109-127.—Reviews research purporting to demonstrate the occurrence of quantitative or qualitative changes in RNA and/or protein during simple and complex behavior. Limitations in interpretation of research results and methodological problems are discussed. Much research indicates that quantitative changes do occur. Generally, increments tend to result with mild or

moderate stimulation; decrements, with drastic or prolonged stimulation. However, there is no conclusive evidence to indicate that qualitatively different RNA and/or protein species are synthesized during behavior. The necessity for research involving methods sensitive to the detection of qualitative changes is suggested. (4 p. ref.)—*Journal abstract.*

7613. Gantt, W. Horsley. (Veterans Administration Hosp., Pavlovian Lab., Perry Point, Md.) **Psychopharmacology and conditional reflexes.** *Conditional Reflex*, 1970(Apr), Vol. 5(2), 109-118.—Drugs may be used in several ways to investigate their role in behavior. The placebo effect is usually connected with the relation of the person to the drug. Using the drug as UCS, its action may help to analyze the role of peripheral vs. central stimuli in the formation of CRs. The effect of drugs which act solely at the peripheral nerve endings without the involvement of the CNS cannot become conditioned. The action of drugs on the CR compared with their action on the UCR explains some of their behavioral effects. Schizokinesis is often prominent in the action of drugs. Although a drug may increase the level of the heart rate, it can also diminish the reactivity shown in the CR. Meprobamate and mescaline affect differently the cardiac and the motor components of the CR, illustrating a schizokinesis. The type of individual is an important factor in the action of drugs; the same drug may have opposite effects on different individuals. This leads to the conclusion that a drug should fit the individual as well as the disease. Autokinesis is often seen in drug action. Therefore a single dose of some drugs, such as acetylcholine, epinephrine, or LSD, may permanently change the relationships between excitation and inhibition, in the direction of improvement or deterioration (positive or negative autokinesis). (22 ref.)—*Journal abstract.*

7614. Goldberg, M. E. & Salama, A. I. (Union Carbide Corp., Sterling Forest Research Center, Tuxedo, N.Y.) **Norepinephrine turnover and brain monoamine levels in aggressive mouse-killing rats.** *Biochemical Pharmacology*, 1969(Feb), Vol. 18(2), 532-534.—Reports findings concerning levels of brain serotonin and norepinephrine and the turnover rate of norepinephrine in mouse-killing, male, Long-Evans rats. Ss were maintained on a restricted food intake of 15 gm/day, and were housed individually. Ss were tested periodically for killer ("muricidal") behavior. 35 killer rats and 39 controls were selected from the colony and sacrificed 24 hr. later. Brain norepinephrine and serotonin levels were determined (Shore and Olin method), and norepinephrine turnover was calculated using the steady state concepts of Neff and Costa. Results fail to demonstrate significant differences of serotonin levels between killer rats and controls; however, there was a 25.5% increase in norepinephrine levels in killer rats.—*B. A. Stanton.*

7615. Golub, Arnold M., Epstein, Leon, & McConnell, James V. (U. Michigan, Mental Health Research Inst.) **The effects of peptides, RNA extracts, and whole brain homogenates on avoidance behavior in rats.** *Journal of Biological Psychology*, 1969(Sep), Vol. 11(1), 44-49.—Trained 23 naive male albino rats to avoid a black box. An equal number of donor rats served as quiet control Ss. Following training, all donor Ss were sacrificed and either total brain homogenates, RNA, or peptide fractions were prepared from their brains. Recipient Ss injected with material from the brains of trained, but not of untrained, donor Ss reversed their

natural preference for the dark. Results suggest that: (a) an effect of some sort does occur following the injection, into naive recipient animals, of material extracted from the brains of trained donor animals, and (b) at least in the black-white avoidance situation, total brain homogenates, and both RNA and peptide fractions from the brains of trained donor rats are all effective in mediating the effect. (16 ref.)—*Journal abstract*.

7616. Gorokhov, A. L. (Research Inst. of Physical Culture, Leningrad, USSR) *Vliyaniye myshechnoi deyatel'nosti na soderzhanie katekholaminov v tkanyakh belykh kryss*. [Influence of muscular activity on catecholamine content in the tissues of trained and untrained white rats.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1411-1415.—Studied the changes in the levels of adrenaline, noradrenaline, and the catecholamine metabolites in the organs of swimming Ss (intensity and duration varied). Change in catecholamine level in the brain was characteristic of the activity. Training increased catecholamine level in the brain. Muscular activity lessened sharp changes in cerebral catecholamine level in trained Ss. Where activity was greatly prolonged, cerebral catecholamine level was significantly higher in trained Ss. (English summary) (21 ref.)—*I. D. London*.

7617. Hanin, L., Massarelli, R., & Costa, E. (St. Elizabeths' Hosp., Washington, D.C.) *Acetylcholine concentrations in rat brain: Diurnal oscillation*. *Science*, 1970(Oct), Vol. 170(3955), 341-342.—Reports that a diurnal oscillation of acetylcholine concentrations in rat brain was demonstrated by gas chromatography in an experiment with male Sprague-Dawley rats. Peak concentrations occurred at 2 hr. of light, and a trough was seen at 6 hr. of darkness. This pattern was observed only in grouped Ss, and emerged after at least 18 days of prior conditioning in an environment with controlled light, humidity, and temperature.—*Journal abstract*.

7618. Iwata, Heitaroh; Shikimi, Tadahiho, & Oka, Taichi. (Osaka U., Toyonaka, Japan) *Pharmacological significances of peptidase and proteinase in the brain: I. Enzymatic inactivation of bradykinin in rat brain*. *Biochemical Pharmacology*, 1969(Jan), Vol. 18(1), 119-128.—Investigated the peptidase activity in rat brain using bradykinin as substrate. The nature and changes during convulsion in activity of the enzymes which inactivates bradykinin (kininase) were examined. The optimum conditions for the assay of kininase were pH 7.6 and about 45°. The kininase activity in the cerebellum was higher than that in the cerebral cortex or the brainstem. On subcellular fractionation, the highest kininase activity was observed in the supernatant, with lower activities in the microsomes, mitochondria, and nuclei. The effects of metal ions (zinc and cobalt ions) and N-ethylmaleimide on the brain kininase activity were different from those on enzyme in the plasma. The activity of the kininase in the cerebellar region increased during convulsions caused by penitrazol or picrotoxin, but not by strychnine and, of the subcellular fractions of the cerebellum of an S after penitrazol administration, the increase was only found in the nuclear fraction. Increased kininase activity in the cerebellar region induced by penitrazol, was only observed during convulsions and not in the preconvulsive or intermediate states. Results suggest that some alteration in the metabolism of brain protein may occur during convulsion.—*Journal abstract*.

7619. Kato, L., Gözsy, B., & Lemieux, Marcel. (U. Montreal, Inst. of Microbiology & Hygiene, Quebec,

Canada) *Conditioning of the microcirculation in the rat. Conditional Reflex*, 1970(Apr), Vol. 5(2), 90-96.—Administered a visual stimulus with ECS on 6 consecutive occasions to 70 Sprague-Dawley rats. It was noted that the light became an effective stimulus for the microcirculation system. Light alone was an indifferent stimulus to catecholamine release. The inhibition of the serotonin-induced vasodilatation by ECS (via catecholamine release) became conditioned to the visual CS. Since the net effect of extrinsic serotonin depends on free catecholamines at the vascular bed, the intensity of the serotonin-induced vascular response reflects alterations in the chemical balancing mechanism. This mechanism can be conditioned with the present technique. Results indicate that there is CNS mediation.—*Journal abstract*.

7620. Katz, Richard I. & Kopin, Irwin J. (National Inst. of Mental Health, Lab. of Clinical Science, Bethesda, Md.) *Release of norepinephrine-³H and serotonin-³H evoked from brain slices by electrical-field stimulation: Calcium dependency and the effects of lithium, ouabain and tetrodotoxin*. *Biochemical Pharmacology*, 1969(Aug), Vol. 18(8), 1935-1939.—In an experiment with male Sprague-Dawley rats, it was found that slices of mammalian brain accumulated tritiated norepinephrine or serotonin when incubated in a medium with these compounds. Mild electrical stimulation of short duration induced a striking increase in the release of exogenous-labeled amine. Electrically stimulated release of norepinephrine-³H, but not of serotonin-³H, was calcium dependent. Stimulation-induced release of both monoamines was significantly diminished by the addition of ouabain, lithium, or tetrodotoxin to the perfusing medium. Elevated calcium concentration prevented lithium-induced inhibition of norepinephrine-³H release but had no effect on lithium inhibition of evoked release of serotonin-³H. Enhanced calcium levels did not reverse ouabain-induced inhibition of release of either monoamine. (22 ref.)—*Journal abstract*.

7621. Liang, C. C. & Quastel, J. H. (U. Hong Kong, China) *Uptake of acetylcholine in rat brain cortex slices*. *Biochemical Pharmacology*, 1969(May), Vol. 18(5), 1169-1185.—Acetylcholine was taken up against a concentration gradient by Wistar rat brain cortex slices, incubated aerobically in a physiological saline medium, in the presence of paraoxon. Optimal rates of acetylcholine uptake were obtained with slices 2-4 mm. thick, in the presence of glucose (> 3mM), in oxygen at 37° and in the presence of paraoxon (> 5μM) which completely inactivated the choline esterase. Little or no uptake apart from that due to passive diffusion occurred in the presence of eserine. It is evident that the uptake was carrier-mediated. The optimal pH for acetylcholine uptake was 8.3 and the amount of uptake in 1 hr., corrected for passive diffusion, was doubled on increasing the temperature of incubation from 17° to 27°. The rate of acetylcholine uptake, corrected for the passive diffusion rate, was approximately proportional to the respiratory rate (in the presence of oxygen or air or in the absence of glucose). It was inhibited by 2:4 dinitrophenol (10 μM) and by ouabain (10 μM), their inhibitions being independent of the acetylcholine concentration. The rate of uptake declined (from its optimal value) in the absence of potassium and calcium ions, or in the presence of relatively high concentrations of potassium chloride (> 50 mM), calcium chloride (8 mM), or magnesium sulfate (6 mM). It was also diminished, but not abolished, by the omission of sodium

ions from the medium. It is concluded that the rate of uptake of acetylcholine (apart from passive diffusion) in the brain slices was partly dependent on the operation of the sodium pump. The possible involvement of exchange diffusion in the process of uptake is discussed. (28 ref.)—*Journal abstract*.

7622. Shikimi, Tadahiro & Iwata, Heitaroh. (Osaka U., Faculty of Pharmaceutical Sciences, Japan) **Pharmacological significances of peptidase and proteinase in the brain: II. Purification and properties of a bradykinin inactivating enzyme from rat brain.** *Biochemical Pharmacology*, 1970(Apr), Vol. 19(4), 1399-1407.—The enzyme inactivating bradykinin (kininase) in the adult male Wistar rat brain was partially purified by ammonium sulfate fractionation and chromatography on Sephadex G-100, diethylaminoethyl cellulose and carboxymethyl cellulose. Enzyme activity was inhibited by chelating agents and increased by calcium. Ovomucoid trypsin inhibitor, tosylphenylalanine chloromethylketone and diisopropylfluorophosphate had no effect. Among the analgesic antipyretic drugs tested, acetylsalicylic acid and aminopyrine activated the enzyme slightly. (32 ref.)—*Journal abstract*.

7623. Spirtes, M. A. (Veterans Administration Hosp., Pittsburgh, Pa.) **Molecular species of chlorpromazine involved in drug binding and effect.** *Aggressologie*, 1968(Mar), Vol. 9(2), 189-192.—Measured the effect of 10⁻⁵ molar chlorpromazine (CPZ) on a control hemolysis of 20% when the surrounding media were at pH levels of 6, 7.3, 8, and 9. At the same time the total amount of chlorpromazine bound at each external pH level was measured by exposing the cells to the drug for 15-30 min., spinning the cells down and measuring the drug content in the supernatant. The erythrocytes were separated from the surrounding fluid in the absence of cell washing by the technique described. This separation was followed by the destruction of these cells with ultrasound and the collection of the resulting intracellular fluid which was analyzed for pH levels and ionic contents. In the absence or presence of hemolysis, at extracellular pH levels of 6, 7.3, 8, and 9, the intracellular pH values were 6.3, 7.3, 7.5, and 7.9. Since the pKa is 9.3, the percentage ionized and unionized CPZ could be calculated outside and inside the cells. Because of this high pKa, the percentage unionized drug was small (4%) except at the extracellular pH of 9 when it reached 33%. The total drug bound by the cells rose little, if at all, from the extracellular pH of 6-8. However, at pH 9 it almost doubled. The inhibitory effect of CPZ on the 20% hypotonic hemolysis was much better at intracellular pH 7.3 than at 6.3 (and peaked at pH 7.9) than at other intracellular pH levels. The intracellular ionized drug fraction was only 2% less at pH 7.9 than 7.5. A discussion of the molecular species necessary for CPZ binding and effect is presented.—*Journal abstract*.

7624. VanderWende, Christina & Johnson, Jeneene C. (Rutgers State U., Newark, N.J.) **Interaction of serotonin with the catecholamines: I. Inhibition of dopamine and norepinephrine oxidation.** *Biochemical Pharmacology*, 1970(Jun), Vol. 19(6), 1991-2000.—Serotonin proved to be an effective inhibitor of both the enzymatic and autoxidation of dopamine and norepinephrine. Kinetic studies of the inhibition of the enzymatic oxidation indicate that serotonin forms an inhibitor-substrate complex. Structure-activity relationships indicate that the ring hydroxyl group of serotonin and the 2 ring hydroxyl groups of the catecholamines are the

only requirements for interaction. The possibility that serotonin modulates the activities of the catecholamines on a purely molecular level through complex formation is discussed.—*Journal abstract*.

7625. VanderWende, Christina & Johnson, Jeneene C. (Rutgers State U., Newark, N.J.) **Interaction of serotonin with the catecholamines: II. Activation and inhibition of adrenochrome formation.** *Biochemical Pharmacology*, 1970(Jun), Vol. 19(6), 2001-2007.—Adrenochrome formation from epinephrine is either accelerated or inhibited by serotonin, the effect being dependent on the relative concentrations of the indoleamine compared to the catecholamine. The possibility that serotonin can regulate adrenochrome formation is discussed with respect to the postulations that these compounds may be involved in mental disease.—*Journal abstract*.

Hormones

7626. Brohult, Johan; Levi, Lennart, & Reichard, Hans. (Karolinska Sjukhuset, Stockholm, Sweden) **Urinary excretion of adrenal hormones in man: Effects of ethanol ingestion, and their modification by chlormethiazole.** *Acta Medica Scandinavica*, 1970, Vol. 188, 5-13.—A large single dose of ethanol (approximately 500-ml whiskey) was administered to 9 young, healthy, males. This stimulus provoked pronounced increases in adrenaline and noradrenaline excretion during and soon after the ethanol ingestion. Similarly, the hangover next morning was accompanied by marked increases in adrenaline and noradrenaline excretion levels, in addition to increased excretion rates of 17-hydroxycorticosteroids. In 5 Ss treated with .5-gm chlormethiazole, the catecholamine increases during the hangover period were significantly reduced. During the week following the ethanol ingestion, the increase in adrenal function tended to persist. Some theoretical and clinical implications of these findings are discussed and some indications in favor of a relationship between the emotional-behavioral and the physiological effects of ethanol ingestion are mentioned. (49 ref.)—*Journal abstract*.

7627. Eshchenko, N. D. & Putilina, F. E. (Leningrad State U., USSR) **Vliyaniye adrenalina i AKTG na obmen glyukozy v golovnom mozge.** [Influence of adrenaline and ACTH on glucose metabolism in the brain.] *Nervnaya Sistema*, 1968, No. 9, 28-34.—Reports results of a study of the metabolism of the energy substrate of the rat brain—glucose—both in the normal state and after the injection of adrenaline or ACTH.—*I. D. London*.

7628. Hardin, Carolyn M. (George Washington U.) **Some neurochemical and fluorescence histochemical correlates of the action of testosterone on developing rat brain.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1503-1504.

7629. Lisk, Robert D. **Mechanisms regulating sexual activity in mammals.** *Journal of Sex Research*, 1970(Aug), Vol. 6(3), 220-228.—Investigated the role of progesterone in the rat and hamster. Results indicate that in the rat if estrogen remains below some critical level, progesterone adjusts the level of receptivity and determines the length of the receptive period. The role of progesterone is only facilitatory, i.e., if estrogen exceeds some critical level the progesterone mechanism is blocked and receptivity is maintained by estrogen alone.

In the hamster normal receptivity could never be induced by estrogen alone. Progesterone always eventually resulted in suppression of receptivity regardless of the quantity of estrogen employed. Timing and degree of sexual activity in the male and female rat are regulated by separate mechanisms of the CNS.—*E. B. Jaffa.*

7630. Prigoryan, V. Z. & Khudaverdyan, D. N. (Medical Inst., Erevan, USSR) *Vliyanie kastratsii i posleduyushchego vvedeniya testosteron-propionata na sudorozhnuyu gotovnost' zhivotnykh.* [Influence of castration and of subsequent administration of testosterone propionate on convulsive readiness in animals.] *Ek'sperimental' ev Klinikakan Bzhshkoy'tyan Handes*, 1970, Vol. 10(1), 11-17.—60 audiosensitive male rats and 7 male dogs, subjected to castration, were studied to determine whether sex glands are involved in convulsive readiness (seizures triggered in the former by loud electric bell; in the latter by injection of an ether-camphor mixture). The initial postcastration level of convulsive readiness appears to determine future effects. If the initial level is low, castration leads to enhancement of convulsive readiness; in the case of higher levels, future effects are contradictory with both enhancement and decline in evidence.—*I. D. London.*

7631. Sneddon, J. M. & Keen, P. (U. Bristol, Medical School, England) *The effect of noradrenaline on the incorporation of ^{32}P into brain phospholipids.* *Biochemical Pharmacology*, 1970(Apr), Vol. 19(4), 1297-1306.—Male Wistar rat brain homogenates incubated with noradrenaline for 5 min., showed reduced incorporation of ^{32}P into phospholipids. Subcellular fractionation studies indicated that this effect of noradrenaline occurred only in the synaptosomal fraction. Incubation with noradrenaline for 20-120 min. increased the incorporation of ^{32}P into phospholipids. This effect occurred in both the synaptosomal and mitochondrial fractions and was inhibited by the α -blocking drug thymoxamine. Noradrenaline did not significantly increase ^{32}P incorporation into phosphoproteins. Results are discussed in terms of a possible transmitter role for noradrenaline in the brain. (25 ref.)—*Journal abstract.*

7632. Verashchagin, S. M., Grachëv, I. I., & Chernyshëva, M. P. (Leningrad State U., USSR) *Izucheniye afferentnoi impul'satsii v nerve molochnoi zhelezy morskoi svinki.* [Study of afferent impulsion in the nerve of the guinea pig mammary gland.] *Nervnaya Sistema*, 1968, No. 9, 58-64.—Guinea pigs in various lactational stages were used to study the changes in electrical activity in the afferent fibers of the main nerve of the mammary gland under chemical and mechanical stimulation of the receptors of the organ during the various stages of the lactational process. Chemical stimulators were: the hypophyseal hormones, prolactin and oxytocin; acetylcholine; and adrenaline. The mechanical stimulator was the introduction of air into the nipple. Afferent impulsion exhibited potentials with an amplitude of 8-33 microV. and a frequency of 3-25 impulses/sec. In both respects the electrical activity of the lactating S exceeded that of the nonlactating. The hypophyseal hormones, when injected into the mammary gland, increased electrical activity in the afferent end of the main nerve. In the presence of little impulsion, the injection of acetylcholine and adrenaline increased electrical activity in the afferent end of the main nerve, but in the presence of enhanced impulsion, they decreased or suppressed entirely electrical activity in the

nerve. Stimulation of the mechanoreceptors in the glandular cavity produced a reaction whose magnitude depended on the following factors: functional state of the organ, tension in the walls of the cavity, amount of pressure, and rate of pressure-change.—*I. D. London.*

Drug Effects—Human

7633. Borgå, Olof; Azarnoff, Daniel L., Forshell, Gustaf P., & Sjöqvist, Folke. (Karolinska Inst., Stockholm, Sweden) *Plasma protein binding of tricyclic antidepressants in man.* *Biochemical Pharmacology*, 1969(Sep), Vol. 18(9), 2135-2143.—Studied the binding of various tricyclic antidepressants to human plasma and the effects of other drugs by an ultrafiltration technique utilizing labeled compounds. At a total concentration of .29 μM the percentage of unbound desmethylinipramine (DMI) was found to be 9.5 ± 1.4 in 41 Ss. The unbound fraction of DMI in plasma increased only twofold when the total concentration of the drug was increased 1000 times. The degree of binding over the entire range of therapeutic plasma drug concentration was relatively constant. The binding of various tricyclic antidepressants was compared at a drug concentration of 1.1 μM . The percentage of unbound drug was for nortriptyline (NT) $5.5 \pm .6$, for amitriptyline (AT) $3.6 \pm .8$, for imipramine (I) $4.2 \pm .8$, for protriptyline (PT) $8 \pm .6$ (tested at a concentration of 7.7 μM) and for Leo 640, an imipramine analog, $7 \pm .7$. The acetyl derivatives of DMI, NT, and PT were more bound than the parent compounds. The addition of NT, PT, or AT in a "therapeutic" concentration of 2 $\mu\text{g}/\text{ml}$ did not displace DMI, nor did chlorpromazine in supratherapeutic concentration. Diphenylhydantoin was found to displace DMI, NT, PT, AT, and particularly I.—*Journal abstract.*

7634. Chiles, W. Dean & Jennings, Alan E. (Civil Aeromedical Inst., Oklahoma City, Okla.) *Effects of alcohol on complex performance.* *Human Factors*, 1970(Dec), Vol. 12(6), 605-612.—Tested 9 male adults on a battery of tasks involving monitoring, 2-dimensional compensatory tracking, and mental arithmetic at 3 levels of work load. Ss ingested 2.5 ml. of 100-proof vodka/kg of body weight 2 hr. before testing; mean blood alcohol at the beginning of testing was approximately 100 mg%. Significant alcohol effects were found for 2 of the monitoring tasks and 3 of the 4 measures of tracking. There was a significant interaction between work load and alcohol in the case of 1 tracking measure.—*Journal abstract.*

7635. Davison, K., Duffy, J. P., & Osselson, J. W. (Newcastle General Hosp., England) *A comparison of sleep patterns in natural and mandrax- and tuinal-induced sleep.* *Canadian Medical Association Journal*, 1970(Mar), Vol. 102(5), 506-508.—Reports within-S comparison of the effects on the overnight sleep EEG of 1 tablet of mandrax (methaqualone base 250 mg. and diphenhydramine hydrochloride 25 mg.) and 200 mg. tuinal (equal parts of quinalbarbitone sodium and amylobarbitone sodium) in 14 17-37 yr. old normal Ss. Mandrax-induced sleep was not significantly different from natural sleep in the duration of light, moderate, deep and REM phases. Tuinal produced a significant reduction in REM sleep ($p < .01$) compared with natural sleep and with mandrax-induced sleep. (French summary)—*Journal abstract.*

7636. El-Zoghby, S. M., El-Shafai, A. K., Abdel-Tawab, G. A., & Kelada, F. S. (Medical Research Inst.,

Cancer Research Unit, Alexandria, Egypt) **Studies on the effect of reserpine therapy on the functional capacity of the tryptophan-niacin pathway in smoker and non-smoker males.** *Biochemical Pharmacology*, 1970(May), Vol. 19(5), 1661-1667.—Tested the functional capacity of the tryptophan-niacin pathway by analysis of 11 metabolites excreted in the urine of 14 smoker and 16 nonsmoker males after loading with L-tryptophan (2 gm.) with and without vitamin B₆ supplement (120 mg.). The excretion pattern was reinvestigated after depletion of the catecholamines by applying reserpine therapy to both groups. Results obtained were compatible with the suggestion that the modification of tryptophan metabolism by smoking may be through the catecholamines discharged by nicotine that man absorbs from smoking. Thereafter, the catecholamines react with the coenzyme (i.e., pyridoxal phosphate) to form inactive tetrahydroisoquinoline derivatives causing a rapid inactivation of the coenzyme, and thereby inhibit preferably the B₆-dependent quinolinic acid decarboxylase enzyme. It is striking, however, that this type of inhibition could not be completely overcome by a large dose of vitamin B₆ orally supplemented. It was only after reserpine therapy that both smokers and nonsmokers gave excretion patterns of tryptophan metabolites which were qualitatively and quantitatively similar. (25 ref.)

7637. Garcez de Sena, Plínio & Rizzo, Alfredo O. (Federal U., Neurology Clinic, Bahia, Brazil) **Aspecto eletroencefalográfico da indução do sono pela associação metahqualona and difenidramina.** [Electroencephalographic of sleep induction by the association of methaqualone and difenidramine.] *O Hospital*, 1969(Dec), Vol. 76(6), 2055-2057.—Monitored the EEG readings of 6 Ss in whom sleep was induced by a combination of methaqualone and difenidramine (M and D). Sleep induced by M and D was characterized by a large incidence of rapid rhythms and a tendency to return to a previous stage of sleep before waking.—P. Hertzberg.

7638. Grant, Ellen C. & Pryse-Davies, John. (Council for the Investigation of Fertility Control, London, England) **Effect of oral contraceptives on depressive mood changes and on endometrial monoamine oxidase and phosphatases.** *British Medical Journal*, 1968(Sep), Vol. 3(5621), 777-780.—Found significant variations in the incidence of depression and loss of libido in 797 women receiving 1 or more of 34 types of oral contraceptives. The highest incidence occurred with strongly progestogenic compounds (especially with those containing small amount of estrogen) which have high MAO activity for most of the cycle. The lowest incidence was found with the strongly estrogenic sequential regimens which have weak MAO activity for most of the cycle. (16 ref.)—*Journal abstract*.

7639. Grinspoon, Lester. (Harvard Medical School, Boston, Mass.) **Marihuana.** *Scientific American*, 1969(Dec), Vol. 221(6), 17-25.—Presents a review of the use of marihuana, emphasizing historical, chemical, medical, and psychological aspects. Behavioral effects are reviewed beginning with descriptions in 19th century literature, and including a clinical record by Walter Bromberg in 1934. Research studies of the effect of cannabis sativa on psychomotor and sensory functions, perception, learning, and simple cognitive tasks are summarized. Evidence suggests that marihuana is not addictive and that physiological effects, if any, are slight.

It is noted that public attitudes in the United States show a "hyperemotional bias" both in support of and opposition to the drug. Social and medical aspects are discussed in terms of such questions as whether the drug leads to narcotics, incites aggression or criminal behavior, or produces physical and mental degeneracy. It is concluded that there is substantial evidence that "the moderate use of marihuana does not produce physical or mental deterioration."—P. McMillan.

7640. Holanda Valente, Luiz C. & Amaral Vieira, F. J. (Ceará Federal U., Medical School, Brazil) **Efeitos de uma associação de ácido gama-aminobutírico e reserpina sobre a atividade intelectual e afetividade de estudantes universitários em período de provas.** [Effects of an association of gamma amino butyric acid and reserpine on the intellectual activity and behavior of students during examination period.] *O Hospital*, 1969(Sep), Vol. 76(3), 1137-1142.—Studied 60 male and female undergraduates divided into 2 groups. 35 Ss in Group A received a combination of gamma-aminobutyric acid and reserpine (RG 3), and 25 Ss in Group B received a placebo. RG 3 and a placebo were administered to Ss for 3 days, 3 hr. before they began studying for an exam. On the 4th day, RG 3 and placebo were administered about 3 hr. before the exam. It was found that RG 3 improved disposition and concentration in studying, and reduced anxiety. 8% of Group A Ss and 12% of Group B Ss showed side effects of drowsiness, headache, and nausea.—P. Hertzberg.

7641. Kelsey, Frances O. (Dept. of Health, Education & Welfare, Food & Drug Administration, Washington, D.C.) **Drugs and pregnancy. Mental Retardation.** 1969(Apr), Vol. 7(2), 7-10.—Reviews "the known hazards to the offspring of mothers given drugs during pregnancy," emphasizing the nature of the drug, time of administration during pregnancy, and dosage. Examples of drugs which may be toxic to the fetus and newborn are cited, e.g., reserpine, novobiacin, and chloromycetin. The steps taken by the Food and Drug Administration "to evaluate the safety of drugs during pregnancy and to communicate information on established or potential adverse effects to the physician" are discussed.—G. Steele.

7642. Makarov, P. O., Loginov, A. V., & Teibe, U. U. (Zhdanov State U., Leningrad, USSR) **Vliyaniye gistamina, adrenalina i atsetilkholina na mekhanoretseptiyu kozh' cheloveka.** [Influence of histamine, adrenaline and acetylcholine on the mechanoreceptors of human skin.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1354-1357.—Utilized the adequate- and discretometric methods, developed by P. O. Makarov, with air-stream as adequate stimulus. Changes in tactile sensitivity in 4 Ss under the influence of histamine, adrenaline, and acetylcholine (10⁻⁴ mg/ml) electrophoretically introduced in the right forearm were investigated. A connection was observed between vascular reactions resulting from the administration of the chemical agents and shifts in the neurodynamic indices. This connection involves the local and CNS as well as the vascular state. (English summary)—I. D. London.

7643. Martin, W. R. & Sloan, J. W. (National Inst. of Mental Health, Addiction Research Center, Lexington, Ky.) **Effects of infused tryptamine in man.** *Psychopharmacologia*, 1970, Vol. 18(3), 231-237.—In an experiment assessing the subjective and physiological effects of tryptamine infused iv in 4 patients, it was found that the drug facilitated the patellar reflex, dilated

pupils, and elevated blood pressure. It also caused changes in vision and hearing, as well as nausea, vomiting, dizziness, sweating, and heaviness of body. These changes are similar to those produced by LSD-like hallucinogens and are consistent with the hypothesis that LSD-like hallucinogens interact with tryptamine receptors as 1 mode of action.—*Journal abstract.*

7644. Rodin, Ernst A. & Calhoun, Hazel D. (Michigan Epilepsy Center & Assn., Detroit) **Metrazol tolerance in a "normal" volunteer population: A ten year follow-up report.** *Journal of Nervous & Mental Disease*, 1970(Jun), Vol. 150(6), 438-443.—A follow-up questionnaire regarding interval life experiences was returned by 26 of 39 college graduates who had participated in a study on metrazol, a barbiturate, tolerance 10 yr. earlier. It was found that Ss who had shown spike wave activity in the EEG—or generalized seizures—had done well in all respects during the interval. Their children had, so far, not had febrile or afebrile convulsive seizures. Ss who had experienced a marked subjective response to the drug, however, had suffered more physical illnesses in the interval and expressed general dissatisfaction with their life achievements. The case of 1 S who committed suicide is presented to highlight the interactions between physiological and psychological mechanisms.—*Journal abstract.*

7645. Worm, Karen. (U. Copenhagen, Denmark) **Fatal amitriptyline poisoning: Determination of the drug in forensic-chemical material.** *Acta Pharmacologica et Toxicologica*, 1969(Oct), Vol. 27(6), 439-444.—In 5 22-45 yr. old females who died from amitriptyline poisoning, an amount of from 0-3 µg/ml of amitriptyline was found in the blood. In the liver, a mixture of nortriptyline and amitriptyline (50-80%) was found in a total concentration of 93-302 µg/gm tissue. In one case, the known dose was 2.5 gm. Death occurred after 7-8 hr. 261 mg. was found in the stomach contents, 3 µg/ml in the blood, and 127 µg/gm in the liver (of which 20% nortriptyline).—*Journal abstract.*

Drug Effects—Animal

7646. Abdullina, R. N. (Bashkir Medical Inst., Ufa, USSR) **Reaktsii perifericheskikh sosudov na nekotorye vasoaktivnye agenty.** [Peripheral vascular reactions to some vasoactive agents.] *Fiziologicheskii Zhurnal SSSR*, 1970(Apr), Vol. 56(4), 605-609.—Cats were used in a comparative study of vascular reaction in the rear leg to the injection of vasoactive agents with myotropic (papaverin) and neurotropic (nembutal, benzohexonium, ormid) action, singly and in combination. Vascular reaction in the extremity was compared with that in the brain and kidneys. The vessels of the extremity displayed the least reaction to a myotropic agent as compared with those of the brain and kidneys. Conversely, neurotropic agents exerted equal or more pronounced action on them. On the basis of an analysis of findings, procured through pharmacological and anatomical denervation, bloodletting, and mesathion-induced hypertension, it is concluded that the weak effect of myotropic agents on femoral vessels is due to the great importance of the neurogenic component of their tonus. Enhancement of the effect of myotropic agents is observed when in combination with agents (gangliolytics, sympatholytics) weakening neurogenic vascular regulation. (English summary)—*I. D. London.*

7647. Agurell, S., Nilsson, I. M., Ohlsson, A., &

Sandberg, F. (Faculty of Pharmacy, Stockholm, Sweden) **Elimination of tritium-labelled cannabins in the rat with special reference to the development of tests for the identification of cannabis users.** *Biochemical Pharmacology*, 1969(May), Vol. 18(5), 1195-1201.—Describes a method for the preparation of tritium-labelled Δ^9 tetrahydrocannabinol and other cannabins. Iv injected Δ^9 -tetrahydrocannabinol- H^3 was eliminated very slowly by 10 female rats; $1/2$ of the administered dose still remained in the body after 1 wk. About 80% of the drug was excreted in metabolized form via feces, the remainder being eliminated also as metabolites in the urine. During the 1st 24 hr., 2-6% of the injected activity appeared in the urine, but less than .006% of the dose, if any, was excreted unchanged. A considerable amount of the activity was readily extractable with ether, and possibly an identification method for cannabis-users may be based on the occurrence of this metabolite. Δ^9 -tetrahydrocannabinol is apparently not excreted as a glucuronide.—*Journal abstract.*

7648. Akera, Tai & Brody, Theodore M. (U. Michigan) **The addiction cycle to narcotics in the rat and its relation to catecholamines.** *Biochemical Pharmacology*, 1968(May), Vol. 17(5), 675-688.—Tolerance to and physical dependence on several narcotic analgesics were demonstrated in the rat. Daily doses of morphine at 30 and 120 mg/kg and levorphanol at 6 and 15 mg/kg given in divided doses 3 times/day were capable of producing tolerance to the analgesic actions. With these treatment regimens withdrawal signs characterized by weight loss, marked diarrhea, piloerection, irritability, muscle rigidity, and anorexia. With the above treatments, no deviation from the normal growth curve of Ss was observed. Adrenal hypertrophy with chronic administration of morphine was not demonstrated. Tolerance to methadone was difficult to achieve and none was observed with chronic thebaine treatment. The severity of withdrawal from levorphanol was as great as or greater than that seen after withdrawal from chronic morphine treatment. While an increase in whole brain norepinephrine (NE) was observed during chronic morphine treatment, no such increase was detected with the chronic administration of levorphanol or methadone, nor was a dose-dependent relationship established. The higher chronic levels of morphine and levorphanol resulted in no higher brain NE concentration. Withdrawal of the S from morphine reduced brain NE levels to control values. No evidence was obtained indicating that the increased NE levels observed during chronic morphine treatment resulted from an increase in NE synthesis. No relationship exists between any phase of the addiction cycle and the levels of brain NE. The increase in brain NE after morphine is peculiar to this drug and is not a characteristic of the drug class.—*Journal summary.*

7649. Bainbridge, J. G. (Imperial Chemical Industries, Pharmaceuticals Div., Macclesfield, England) **The inhibitory effect of amphetamine on exploration in mice.** *Psychopharmacologia*, 1970, Vol. 18(3), 314-319.—In an experiment with male mice, amphetamine decreased exploratory activity at moderate doses. Conditions under which the drug caused increased motility occurred at dose levels above 10 mg/kg in combination with either (a) an explored environment, or (b) the grouping of several Ss in 1 cage.—*Journal abstract.*

7650. Bättig, K. (Swiss Federal Inst. of Technology,

Zurich) **Differential effects of nicotine and tobacco smoke alkaloids on swimming endurance in the rat.** *Psychopharmacologia*, 1970, Vol. 18(3), 300-304.—In 3 experiments the swimming endurance of 110 rats was measured in a water tub until Ss submerged for 2 sec. under the water surface. The total alkaloid fraction extracted from cigarette smoke produced deterioration of performance in doses of .05-.2 mg/kg, whereas pure nicotine (.1 and .2 mg/kg), and nicotine pretreated analogously to the extraction process of the total alkaloids produced performance improvements.—*Journal abstract.*

7651. Berlyne, D. E. (U. Toronto, Ontario, Canada) **The reward value of light increment under supra-normal and subnormal arousal.** *Canadian Journal of Psychology*, 1969(Feb), Vol. 23(1), 11-23.—2 Experiments, with 80 male Wistar rats each, studied the effects of methamphetamine and pentobarbital, respectively, on the reward value of light increment, alternating training days with test days to separate learning effects from performance effects. During the 1st wk. of Exp. I, if injected on training days with saline solution, Ss trained with light increment performed more responses on test days than Ss trained without light increment but, if injected with methamphetamine, Ss trained with light increment performed fewer responses. During the 2nd wk., training with light increment became relatively more effective for those trained under 2 or 3 mg/kg of methamphetamine but less effective in Ss with 0 or 1 mg/kg. In Exp. II, the difference in number of test-day responses between Ss trained with and without light increment decreased when pentobarbital injections (5, 10, 15, or 20 mg/kg) were administered on training days. In both experiments, more responses were performed on training days by Ss receiving light increments, and the number of responses varied inversely with doses of drugs. Results complement previous findings and indicating that the reward value of an indifferent stimulus depends on an interaction between the arousal value of the stimulus and arousal level of the organism. (French summary) (18 ref.)—*Journal abstract.*

7652. Black, Ira B., Parker, Larry, & Axelrod, Julius. (National Inst. of Mental Health, Lab. of Clinical Science, Bethesda, Md.) **A daily rhythm in the rate of depletion of brain norepinephrine by reserpine.** *Biochemical Pharmacology*, 1969(Nov), Vol. 18(11), 2688-2691.—Describes a circadian rhythm in the rate of depletion of brain norepinephrine by reserpine, and reports that environmental lighting factors are capable of altering the norepinephrine depletion rhythm. Groups of female Sprague-Dawley rats were treated with 1-2 mg/kg of reserpine and killed (with controls) 4 hr. later. Reduction of whole brain norepinephrine varied with the time of day. The highest depletion was observed during the dark period, while reduction of endogenous norepinephrine varied from 10 AM to 2 PM, to a peak produced at 2 AM. Dosages of .5 mg/kg produced no significant norepinephrine rhythm patterns. It is suggested that the rhythm was not endogenous, since a reversal of the lighting schedule shifts the phase of the rhythm by 180°.—B. A. Stanton.

7653. Cannizzaro, G. (U. Palermo, Inst. of Pharmacology, Italy) **Farmacologia dell'equilibrio idrico-salino quale motivazione del comportamento operante.** [Pharmacology of electrolyte balance which influences motivation of operant behavior.] *Acta Neurologica*, 1969(Jan), Vol. 24(1), 66-77.—Investigated the

possibility of measuring the influence of peripheral actions on the CNS using a technique based on an operant behavior test. Results show that, interfering with the equilibrium of electrolytic solutions with the use of sodium chloride, glucose, and drugs, it is possible to modify the intensity of thirst motivation. Ip injection of aqua fontis distinctly reduces the rats' working activity, while injection of 1.8% NaCl and 5% glucose solution does not modify this behavior. This drug displays its action only if given when it can influence the processes of elimination of water and salts. No effect was observed after the injection either of drugs able to influence the diuresis (posthypophysis extract and hydrochlorothiazide) or of hypotensive substances with peripheral action (tetranitrate of pentaerythrol). (17 ref.)—*English summary.*

7654. Carr, L. A. & Moore, K. E. (U. Louisville) **Effects of amphetamine on the contents of norepinephrine and its metabolites in the effluent of perfused cerebral ventricles of the cat.** *Biochemical Pharmacology*, 1970(Jul), Vol. 19(7), 2361-2374.—1 hr. after the injection of dl-³H-norepinephrine into the cat cerebroventricular system, ventricles were perfused with an artificial cerebrospinal fluid (CSF). 2 hr. after the perfusion was initiated the amount of radioactivity in the effluent remained relatively steady. At this time the ventricular system was perfused for 30 min. with CSF containing various concentrations of d- or l-amphetamine. d-Amphetamine sulfate (25 400 µg/ml) caused an immediate increase in the content of ³H-norepinephrine in the effluent; after a latent period of 10-20 min. there was also a significant increase in the effluent content of ³H-normetanephrine while the concentration of deaminated-O-methyl metabolites did not change. l-Amphetamine sulfate (50 µg/mg) did not significantly increase the amount of ³H-norepinephrine or ³H-normetanephrine in the perfusion effluent. d-Amphetamine caused a greater increase in the effluent concentration of ³H-norepinephrine and ³H-normetanephrine when the amine was injected into the lateral ventricle than when it was injected into the 3rd ventricle or cisterna magna. Iv injections of d-amphetamine (1 mg/kg) also increased the content of ³H-norepinephrine in the perfusion effluent. After injections of ³H-dopamine into the lateral ventricle, d-amphetamine increased the efflux of both ³H-norepinephrine and ³H-dopamine, whereas after the intraventricular administration of ¹⁴C-inulin or ¹⁴C-urea, the effluent content of these inert substances was not increased by d-amphetamine. Results indicate that amphetamine increases the efflux of catecholamines from structures bordering the cerebroventricular system by blocking the reuptake process, or enhancing the release mechanism, or both. (38 ref.)—*Journal abstract.*

7655. Carr, L. A. & Moore, K. E. (U. Louisville) **Release of norepinephrine and normetanephrine from cat brain by central nervous system stimulants.** *Biochemical Pharmacology*, 1970(Sep), Vol. 19(9), 2671-2675.—Previous studies concerning the central biochemical actions of cocaine are confusing. This drug does not alter brain concentrations of norepinephrine, but blocks the brain uptake of intracisternally administered, but not intraventricularly administered, ³H-norepinephrine, and prevents the accumulation of ³H-norepinephrine in brain slices. It has been suggested that cocaine may not have the same actions in the intact brain as it does in brain slices or in the peripheral

nervous system. Results of the present study, with mongrel cats, suggest that cocaine does not act by increasing the synaptic concentration of norepinephrine in structures lining the ventricular system. Caffeine has no effect on the concentration of norepinephrine in the cat hypothalamus, but it has been suggested that this drug releases norepinephrine from the rat heart and brain. Results suggest that the central stimulating actions of caffeine not related to an increased concentration of norepinephrine at postsynaptic receptor sites. However, the possibility exists that both caffeine and cocaine exert their effects at sites that are not adjacent to the ventricular system. Since neither cocaine nor caffeine increases the efflux of ^3H -norepinephrine or ^3H -normetanephrine, but like other central stimulants studied, both increase motor activity, it would appear that the increased efflux observed during perfusion of the other drugs is not the result of generalized CNS stimulation. Rather, it would appear that amphetamine, ephedrine, *p*-chloroamphetamine, methylphenidate, and possibly pipradrol, act directly at the terminals of catecholamine-containing neurons. (31 ref.)—*Journal abstract*.

7656. Chisholm, Drake C. & Moore, John W. (U. Massachusetts) Effects of chlordiazepoxide on discriminative fear conditioning and shuttle avoidance performance in the rabbit. *Psychopharmacologia*, 1970, Vol. 18(2), 162-171.—Previously acquired shuttle avoidance performance in rabbits was reduced by chlordiazepoxide. Other Ss were given chlordiazepoxide during differential tone-shock pairings. The effects of differential Pavlovian fear conditioning were tested during extinction. Comparison with saline controls showed that chlordiazepoxide did not disrupt fear conditioning. The decrement produced by chlordiazepoxide was not due to a sensory or motor impairment. (15 ref.)—*Journal abstract*.

7657. Coutinho, C. B., Cheripko, J. A., & Carbone, J. J. (Hoffmann-La Roche, Inc., Nutley, N.J.) Relationship between the duration of anticonvulsant activity of chlordiazepoxide and systemic levels of the parent compound and its major metabolites in mice. *Biochemical Pharmacology*, 1969(Feb), Vol. 18(2), 303-316.—Presents data relating to the anticonvulsant (antimetrazol) activity of chlordiazepoxide in CF-1 mice in relation to blood levels, tissue distribution patterns, and major metabolites. Quantitation of the effect of a 125 mg/kg subcutaneous injection of metrazol and the degree of protection by a single 20 mg/kg oral dose of chlordiazepoxide, based on measuring the incidence of defined seizure reactions, indicated maximal protection for 4 hr. Differential spectrofluorometric analyses of blood, brain, and muscle tissue samples for chlordiazepoxide and its major metabolites show that N-desmethylchlordiazepoxide is the major constituent in all 3 tissues both in the absence and presence of metrazol. Correlation of the levels of chlordiazepoxide and its metabolites in these tissues to its anticonvulsant (antimetrazol) activity indicates that it is the concentration of the N-desmethyl metabolite that most closely parallels the pattern of this anticonvulsant activity.—*Journal abstract*.

7658. Crow, T. J. (U. Aberdeen, Scotland) Enhancement by cocaine of intra-cranial self-stimulation in the rat. *Life Sciences*, 1970(Apr), Vol. 9(7, Pt. 1), 375-381.—Male hooded rats implanted with bipolar electrodes in the ventral midbrain tegmentum were

injected with either cocaine hydrochloride or saline ip to determine if cocaine can by itself enhance self-stimulation rates as amphetamines have been shown to do. It was found that 5 mg/kg cocaine produced enhancement of response rate similar to that of the amphetamines. It is suggested that these results can be considered to be consistent with the aminergic theory of reward, whereby these drugs act by a sensitization of the reward system by blockade of uptake or by increasing the amount of transmitter released by nerve activity, only if it can be shown that these drugs potentiate the effect of neural release of catecholamines.—*W. E. Wood*.

7659. Dési, L., et al. (U. Budapest, Medical School, Hungary) The process of learning in rats undergoing prolonged treatment with psychotropic agents. *Psychopharmacologia*, 1970, Vol. 18(2), 144-153.—Rats received .5 mg/kg/day of amphetamine or .5 mg/kg/day of chlorpromazine added to drinking water. Other groups received daily ip injections of .25 mg/kg of amphetamine or 4 mg/kg of chlorpromazine. Initially the learning index deteriorated by oral administration of amphetamine, but then improved, whereas ip treatment caused a slight deterioration. Both agents interfered with previously acquired CRs. The frequency of pseudo-positive responses was considerably higher following administration of amphetamine, but was unaltered by chlorpromazine.—*Journal abstract*.

7660. Dingell, James. V. & Bass, Allan D. (Vanderbilt U., Medical School, Psychopharmacology Research Center) Inhibition of the hepatic metabolism of amphetamine by desipramine. *Biochemical Pharmacology*, 1969(Jun), Vol. 18(6), 1535-1538.—Investigated the inhibitory action of desipramine (DMI) on the metabolism of amphetamine in hepatic microsomes and isolated perfused liver of male Sprague-Dawley rats. Centrifuged liver homogenates obtained from sacrificed Ss were incubated with 1.7 ml. of a .2 molar potassium buffer, following which 1 of the following drugs was added to the mixture and incubated for an additional 30 min.: (a) aminopyrine (5 μ moles), (b) nicotinamide (100 μ moles), or (c) magnesium chloride (150 μ moles). Liver perfusion studies were conducted using Axlerod's method. Results show that neither d- nor l-amphetamine was metabolized by microsomal rat liver which did, however, metabolize both aminopyrine and hexobarbital. DMI (in the liver perfusion study) markedly inhibited the metabolism of amphetamine. Results demonstrate that inhibition of amphetamine metabolism following DMI administration is a consequence of impairment of metabolism caused by the presence of hepatic enzymes. Since previous studies have shown that rabbit microsomal liver tissues are capable of metabolizing amphetamines, it is suggested that there are distinct differences in the metabolism of amphetamines by rats and rabbits.—*B. A. Stanton*.

7661. Downes, Hall. (U. Utah) Effects of a convulsant barbiturate on dorsal root ganglion cells and other components of the spinal reflex arc. *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 833-834.

7662. Driscoll, P. & Bättig, K. (Swiss Federal Inst. of Technology, Zurich) The effect of nicotine and total alkaloids extracted from cigarette smoke on avoidance behavior in rats under extinction procedure. *Psychopharmacologia*, 1970, Vol. 18(3), 305-313.—Measured the effect of nicotine and total alkaloids extracted from smoke on the avoidance behavior of 21 male albino

rats under extinction procedure in an experiment extended over a 3-mo period. There was no significant difference between the 2 substances, with both inhibiting the extinction of avoidance response to approximately the same degree. Significance against the control was achieved with all treatments, the effect being significantly greater with the dose of .2 mg/kg than with the 2 doses of .1 or .05 mg/kg.—*Journal abstract.*

7663. Fekete, Márton & Kürti, Marianne. (Research Inst. for Pharmaceutical Chemistry, Budapest, Hungary) **Psychopharmacologic effects of some cholinesterase inhibitors in comparison with imipramine.** *Psychopharmacologia*, 1970, Vol. 18(3), 238-248.—In an experiment with 5 mice it was found that imipramine and physostigmine, neostigmine, and dyflos inhibited the catalepsy elicited by injections of tetrabenazine, chlorpromazine, and bulbocapnine, respectively. This inhibition was demonstrable only at a given dose interval in certain cases. Both imipramine and cholinesterase inhibitors tested enhanced the hypermotility caused by amphetamine in mice, but not in conditioned male Wistar rats. The effect exerted by chlorpromazine on conditioned reflex activity was inhibited by neostigmine and physostigmine. Results are discussed in relation to the (a) effect produced by cholinesterase inhibitors on the permeability of the blood-brain barrier, and (b) possible significance of the cholinergic affinity of imipramine on its pharmacological effects. (40 ref.)—*Journal abstract.*

7664. Frey, H. H. (Leo Pharmaceutical Products, Ballerup, Denmark) **Determination of the anticonvulsant potency of unmetabolized trimethadione.** *Acta Pharmacologica et Toxicologica*, 1969(May), Vol. 27(4), 295-300.—Determined the iv effective dose for 50% of the Ss of trimethadione (3,5,5-trimethyl-2,4-dioxooxazolidine) and its metabolite dimethadione (5,5-dimethyl-2,4-dioxooxazolidine) in HaM/ICR strain mice by the pentetrazole seizure threshold test at different time intervals after the injection. Concurrently, the serum concentrations of dimethadione were determined. Results show that the anticonvulsant potency of unmetabolized trimethadione on a molar basis is 1.25 times that of dimethadione.—*Journal abstract.*

7665. Gaudiano, A., et al. (Istituto Superiore di Sanità, Rome, Italy) **Effects of chlorpromazine on behaviour of some enzymes of rat liver in different experimental conditions.** *Biochemical Pharmacology*, 1969(Jan), Vol. 18(1), 65-72.—Studied the behavior of 3 lysosomal hydrolases (acid phosphatase, cathepsin, and β -glucuronidase), of 2 mitochondrial enzymes (cytochrome oxidase and malic dehydrogenase) and of the glucose-6-phosphatase of the rat liver in 3 different experimental conditions (injection of dextran, fasting, and ischemia). The common effect of all these treatments is a marked increase of the "non-sedimentable" activities of the lysosomal hydrolases. Many of the unfavorable effects of these treatments can be antagonized by chlorpromazine.—*Journal abstract.*

7666. Giachetti, A. & Shore, P. A. (U. Texas, Southwestern Medical School, Dallas) **Permeability changes induced in the adrenergic neurone by reserpine.** *Biochemical Pharmacology*, 1970(May), Vol. 19(5), 1621-1626.—Rabbit heart slices preloaded with l- or d-metaraminol (l- or d-MA) showed relatively little washout of either amine, although only l-MA is stored in the adrenergic intraneuronal storage granules. Washout of either amine was enhanced by desipramine or

ouabain, while tetrabenazine had no effect. Reserpine pretreatment caused a marked increase in the efflux rate of both l- and d-MA in control slices, as well as those treated with desipramine or ouabain. The peak effect of reserpine occurred 18 hr. after injection and after a dose of .5 mg/kg or higher. The dose and time required for effect on amine efflux differed from those required for maximal effects on the granular amine storage mechanism. Lowering the reincubation temperature greatly inhibited the rate of amine efflux from control and drug-treated slices. It is concluded that high doses of reserpine greatly enhance, and cold effectively inhibits, the permeability of the adrenergic neurone membrane to the outward movement of amines.—*Journal abstract.*

7667. Hermansen, Keld. (Pharmacia A/S, Research Div., Copenhagen, Denmark) **Effect of different β -adrenergic receptor blocking agents on hexobarbital induced narcosis in mice.** *Acta Pharmacologica et Toxicologica*, 1969(Oct), Vol. 27(6), 453-460.—Found that hexobarbital anesthesia in male mice was 100% prolonged by the following doses of: propranolol: 18 mg/kg ip; (+)-propranolol: 16; (-)-propranolol: 18; 1-(isopropylamino)-3-(o-allylphenoxy)-2-propanol, HCl (H56/28 = aptin: 16; dichloroisoprenaline, HCl: 3-10; 2-(isopropylamino)-1-(p-nitrophenyl)ethanol, HCl (INPEA): no effect; 4-(2-isopropylamino-1-hydroxyethyl)methane sulfonanilide, HCl (MJ 1999): 190; 1-(isopropylamino)3-(o-phenoxyphenoxy)-2-propanol, HCl (Ph QA 33): 17. No correlation was found between the prolongation of anaesthesia and the β -adrenergic blocking effect.—*Journal abstract.*

7668. Hobbs, Donald C. (Chas. Pfizer & Co., Inc., Groton, Conn.) **Distribution and metabolism of doxepin.** *Biochemical Pharmacology*, 1969(Aug), Vol. 18(8), 1941-1954.—Reports drug metabolism studies with doxepin in Long-Evans hooded rats and dogs which reflect the fundamental similarity of its structure to that of the related tricyclic psychotherapeutic agents, amitriptyline, and imipramine. Doxepin was well absorbed after oral administration, and measurable amounts of doxepin and demethyl doxepin quickly appeared in the blood. Although numerous metabolites of doxepin were observed in liver and urine, only doxepin and demethyl doxepin were found in the rat brain, where the same ratio of cis- and trans isomers as in the administered drug was still present. Metabolic transformations include demethylation, N-oxidation, hydroxylation, and glucuronide formation. In the rat, doxepin and its metabolites were found in all tissues examined but, with the exception of the pigmented eye, rapidly cleared. This affinity for melanin was also reflected in studies in vitro with beef eyeball melanin, where, however, doxepin was less strongly bound than amitriptyline. (34 ref.)—*Journal abstract.*

7669. Ingoglia, Nicholas A. (New York U.) **Localization and the effects of chronic administration of methadone and morphine in mice and rats.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1437-1438.

7670. Jones, B. J., Tolman, B. D., & Roberts, D. J. (School of Pharmacy, Portsmouth, England) **Studies on interactions involving antidepressive and other drugs with tetrabenazine and noradmanine on locomotor activity in mice, including details of the experimental design and statistical analysis.** *Psychopharmacologia*, 1970, Vol. 18(3), 288-299.—Describes a method for the measurement of drug interactions on

locomotor activity in mice. The experiments, with 10 groups of 30 male albino Swiss mice in each, were designed on a factorial basis and the data obtained were subjected to variance analysis. The effects of various drugs on the hypoactivity induced by noradrenaline or tetrabenazine were studied. 20 potential drug interactions were examined, but only 7 exhibited statistically significant interaction. Tetrabenazine hypoactivity was antagonized by nortriptyline, amitriptyline, nialamide, and noradrenaline. The latter also potentiated the effect of a low dose of tetrabenazine. Hypoactivity induced by noradrenaline was antagonized by amitriptyline and nortriptyline, potentiated by atropine, but unaffected by nialamide. The significance of these findings is discussed. (22 ref.)—*Journal abstract*.

7671. Jori, A., Bernardi, D., Pugliatti, C., & Garattini, S. (Mario Negri Inst. of Pharmacological Research, Milan, Italy) **Strain differences in the metabolism of Imipramine by rat.** *Biochemical Pharmacology*, 1970(Apr), Vol. 19(4), 1315-1321.—Compared the hyperthermic response to injected imipramine in reserpinized rats in different strains, e.g., Sprague-Dawley, Holtzman, Wistar, and Long-Evans. Long-Evans Ss are less reactive than all the other strains to the antireserpine activity of imipramine and show high levels of imipramine and low concentrations of desipramine into the brain. In vitro experiments show that hepatic microsomal enzymes from Long-Evans Ss metabolize imipramine to desipramine and also other substrates, e.g., p. nitroanisole, aniline, and aminopyrine to respective metabolites to a smaller extent than other Ss. The reduced metabolic activity in addition to other possible reported effects, may be responsible for the reduced hyperthermic activity following imipramine in Long-Evans reserpinized Ss. (15 ref.)—*Journal abstract*.

7672. Khanna, J. M. & Kalant, H. (U. Toronto, Ontario, Canada) **Effect of inhibitors and inducers of drug metabolism on ethanol metabolism in vivo.** *Biochemical Pharmacology*, 1970(Jun), Vol. 19(6), 2033-2041.—SKF 525-A (β -diethylaminoethyl diphenylpropyl acetate), in a dose of 50 mg/kg ip had no effect on ethanol sleeping time or on the rate of disappearance of ethanol from the whole body in mice, or on the slope of linear decrease of blood ethanol concentration in rats. It appeared to delay the absorption or distribution of ethanol, as shown by a cross-over in the blood curves. Chronic pretreatment with chlorcyclizine or phenobarbital, in doses which significantly shortened the pentobarbital sleeping time, had no effect on ethanol sleeping time or ethanol metabolism in rats, although onset of sleep was delayed in rats pretreated with phenobarbital. It is concluded that the hepatic microsomal drug metabolizing systems are probably not involved in ethanol metabolism in vivo, or in cross-tolerance between ethanol and other drugs. (21 ref.)

7673. Khavari, Khalil A. (U. Wisconsin, Milwaukee) **Adrenergic-cholinergic involvement in modulation of learned behavior.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 284-291.—Selected doses of 2 anticholinergics (atropine and scopolamine) and a sympathomimetic drug (d-amphetamine) were injected ip or directly into the cerebral ventricle of 24 male albino Sprague-Dawley rats. All treatments produced analogous changes in the performance of learned behavior. Data (a) implicate a dichotomous CNS adrenergic-cholinergic neurotransmitter mechanism in the control of learned behavior, and

(b) suggest that the observed behavioral changes are manifestations of transitory memory impairment. (18 ref.)—*Journal abstract*.

7674. Lahti, R. A. & Platz, P. A. (Upjohn Co., Kalamazoo, Mich.) **Selective protection of serotonin stores against the action of reserpine by α -methyl-5-hydroxytryptophan pretreatment.** *Biochemical Pharmacology*, 1969(Oct), Vol. 18(10), 2363-2369.—Administration of a single dose of 200 mg/kg of α -methyl-5-hydroxytryptophan to mice results in a rapid decline of brain norepinephrine of approximately 50% and a concomitant increase in "apparent" serotonin of 150-200%. The increase in "apparent" serotonin was attributed to the formation of α -methyl serotonin and shown to be so by the use of ^3H - α -methyl-5-hydroxytryptophan. A time study indicated that after a single dose of the α -methyl amino acid the apparent serotonin levels were elevated above normal for up to 48 hr. Pretreatment of Ss with α -methyl-5-hydroxytryptophan prevented the depletion of serotonin stores by reserpine, but did not protect norepinephrine stores. A time study demonstrated that such protection against reserpine is afforded for at 24 hr. after the administration of α -methyl-5-hydroxytryptophan. (15 ref.)—*Journal abstract*.

7675. Liang, C. C. & Quastel, J. H. (U. Hong Kong, China) **Effects of drugs on the uptake of acetylcholine in rat brain cortex slices.** *Biochemical Pharmacology*, 1969(May), Vol. 18(5), 1187-1194.—Presents a list of drugs which inhibit competitively uptake of acetylcholine against a concentration gradient into rat brain cortex slices incubated aerobically at 37° in a physiological saline-glucose medium containing 20 μM paraoxon: eserine, tetramethylammonium chloride, tetraethylammonium chloride, atropine, cocaine, procaine, lidocaine, chlorprocaine, methacholine, succinylcholine, d-tubocurarine, hexamethonium, pilocarpine, nicotine, strychnine, and hemicholinium. The following drugs inhibit noncompetitively: chlorpromazine and amphetamine. A comparison of the inhibitor constants of a number of these drugs, which act competitively on acetylcholine transport, with the inhibitor constants towards acetylcholine esterase or certain neurophysiological acetylcholine receptor sites, leads to the conclusion that the transport carrier site for acetylcholine is not identical in chemical structure with the anionic site of acetylcholine esterase or with the acetylcholine receptor sites. The noncompetitive effects of certain drugs suggest the presence of a site on the transport carrier, with an affinity for these drugs, which affects the reactions of acetylcholine at the brain cell membrane.—*Journal abstract*.

7676. Lindemann, M., Schilter, R., & Sinkwitz, K. D. (Humboldt U., Medical Faculty, Berlin, E. Germany) **The influence of the ganglionic blocking agent ganglion on viscerovisceral and viscerocerebral reactions of the cat.** *Conditional Reflex*, 1970(Apr), Vol. 5(2), 97-108.—Studied in 21 subacute or chronic cats the influence of gallbladder distention on heart rate, respiratory movements, bioelectrical activity of the cerebral cortex and motor behavior under normal conditions and after ip administration of a ganglionic blocking agent. In control groups without administration of the drug, changes of heart and respiratory rates were observed during the mechanical stimulation of the gallbladder. These effects were independent of a sleeping or nonsleeping state of the S. In some cases viscerovisceral reactions could be accompanied by an arousal

reaction. After administration of the blocking agent in amounts ranging between 5-50 mg/kg body weight the viscerovisceral reactions were inhibited, whereas the behavioral arousal remained. (2 p. ref.)—*Journal abstract*.

7677. Loh, Horace H., Shen, Fu-Hsiung, & Way, E. Leong. (Wayne State U.) **Inhibition of morphine tolerance and physical dependence development and brain serotonin synthesis by cycloheximide.** *Biochemical Pharmacology*, 1969(Dec), Vol. 18(2), 2711-2721.—Mice were rendered tolerant to and physically dependent on morphine by daily subcutaneous injections of increasing doses of morphine for 3 wk. The degree of tolerance was determined by measuring the increase in the median analgesic dose of morphine in relation to response to thermal stimulus, and dependence was determined by the precipitation of withdrawal jumping with the antagonist, naloxone. The concomitant daily administration of cycloheximide with morphine prevented the development of tolerance and physical dependence. The increase in brain serotonin turnover, which was noted to accompany development of tolerance and physical dependence, was also blocked. Findings suggest that the 3 responses to morphine may be closely related. (19 ref.)—*Journal abstract*.

7678. Maj, J., Grabowska, M., & Kwiec, J. (Polish Academy of Sciences, Inst. of Pharmacology, Cracow) **The effect of disulfiram, diethyldithiocarbamate and dimethyldithiocarbamate on serotonin and 5-hydroxyindole-3-acetic acid brain levels in rats.** *Biochemical Pharmacology*, 1970(Aug), Vol. 19(8), 2517-2519.—Investigated the activity of disulfiram (DS), diethyldithiocarbamate (DE), and dimethyldithiocarbamate (DM) on cerebral serotonin (5-HT) and catecholamine (C) levels. Ip injections of 3% DS suspensions were given 3 times at 2-hr intervals to albino Wistar rats, while DE and DM (in saline) were given in single doses. Ss were sacrificed 3 hr. following DS injections, or 2 hr. following DE or DM injections. 5-HT and 5-hydroxyindole-3-acetic acid (5-HIAA) levels were determined using the Ansell and Beeson method. Results indicate that only 2 significant changes occurred: (a) DE (250 mg/kg) increased 5-HIAA content to 143%, and (b) DE (500 mg/kg) lowered 5-HT content to 75%. It is concluded that DS, DE, and DM do not effect 5-HT levels in rat brains. (17 ref.)—*B. A. Stanton*.

7679. Mal'chikova, L. S. & Poskonova, M. A. (Moscow State U., USSR) **Vliyaniye adrenalina i adenilovoykh nukleozidov na spontannuyu aktivnost' i atsetilkholinovuyu kontrakturu gladikih myshts.** [Influence of adrenaline and adenylnucleotides on the spontaneous activity and acetylcholine-induced contraction of smooth muscles.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1378-1384. Utilized the smooth muscles of frog gastric circular muscle and guinea pig taenia coli in a study of their reaction to the action of adenosine tri-, di-, and monophosphate, as well as of adrenaline. A definite similarity existed in the action of adrenaline and that of the adenylnucleotides on the spontaneous activity of smooth muscles, depressing such activity and relaxing the muscles. The adenylnucleotides effectuated their inhibitory influence through the beta-adrenoreceptors which serve as the substrate of adrenaline in its inhibitory effect on the smooth musculature. Adrenaline and the adenylnucleotides abolished or diminished the reaction to acetylcholine in the muscles studied. (English summary) (23 ref.)—*I. D. London*.

7680. Marcucci, F., Fanelli, R., Mussini, E., & Garattini, S. (Mario Negri Inst. of Pharmacological Research, Milan, Italy) **Effect of phenobarbital on the in vitro metabolism of diazepam in several animal species.** *Biochemical Pharmacology*, 1970(May), Vol. 19(5), 1771-1776.—Investigated the metabolic pathway by which diazepam is transformed in vitro by liver microsomes from control and phenobarbital-treated male Sprague-Dawley rats, albino Swiss mice, and albino guinea pigs. Increased diazepam metabolism resulting from phenobarbital treatment led to the formation of increased amounts of hydroxylated metabolites in mice, and of both hydroxylated and N-demethylated metabolites in rats. In guinea pigs pretreatment with phenobarbital produced only an increased formation of N-demethylated metabolite. In all the animal species considered, in addition to the increased diazepam metabolism, phenobarbital treatment led to a decreased recovery of diazepam from incubation medium.—*Journal abstract*.

7681. McCarroll, James E. (U. Arkansas) **Magnesium pemoline: Effects of high dosage on water maze performance by rats.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1567.

7682. Meyerson, Bengt J. & Lewander, Tommy. (U. Uppsala, Sweden) **Serotonin synthesis inhibition and estrous behavior in female rats.** *Life Sciences*, 1970(Jun), Vol. 9(12, Pt. 1), 661-671.—Estrogen and progesterone are normally required to activate estrous behavior (i.e., lordosis response) in ovariectomized rats. Previous data suggest that serotonergic pathways inhibit the hormone activated estrous behavior. The present results show that the tryptophan hydroxylase inhibitor p-chlorophenylalanine (PCPA, 350 mg/kg), but not p-propyldopacetamid (H 22/54, 500 mg/kg), can replace the progesterone treatment. The ability of PCPA to activate estrous behavior could be due to decreased serotonin biosynthesis in combination with loss of serotonin from storage sites caused by PCPA itself or a metabolite. A release is indicated by a significant inhibition of the estrogen + progesterone activated estrous behavior, if PCPA is preceded by the MAO inhibitor pargyline (25 mg/kg). No inhibitory effect was obtained when the order of the injections of the 2 drugs was reversed. No similar inhibition was caused by H 22/54 preceded by pargyline. The turnover of serotonin in brains of ovariectomized, hormone treated females was estimated by measuring the decrease in brain serotonin after inhibition of tryptophan hydroxylase with PCPA or H 22/54. No changes in turnover of brain serotonin were found after estrogen, estrogen + progesterone, or progesterone treatment.—*Journal summary*.

7683. Moore, Kenneth E. (Michigan State U.) **Effects of disulfiram and diethyldithiocarbamate on spontaneous locomotor activity and brain catecholamine levels in mice.** *Biochemical Pharmacology*, 1969(Jul), Vol. 18(7), 1627-1634.—Reports that ip injections of diethyldithiocarbamate (DDC) or disulfiram (DS), both of which inhibit dopamine- β -hydroxylase, did not alter brain levels of dopamine but caused a dose-dependent reduction of both the brain content of norepinephrine and the spontaneous locomotor activity of male albino mice. These latter effects were not causally related, since pretreatment with a MAO inhibitor prevented the DDC- and DS-induced depletion of norepinephrine, but did not alter the ability of these drugs to depress spontaneous locomotor activity. Exposure of Ss to a 4° environment

did not alter DS-induced depletion of brain norepinephrine or behavioral depression. When administered in the diet, DS reduced the brain content of norepinephrine but did not depress motor activity; DDC did not alter either parameter. Results indicate that the central depressant effects of DDC and DS are not exclusively due to the ability of these drugs to alter the absolute levels of brain catecholamines. (23 ref.)—*Journal abstract*.

7684. Mulé, S. J. (New York State Narcotic Addiction Control Commission, New York) **Inhibition of phospholipid-facilitated calcium transport by central nervous system-acting drugs.** *Biochemical Pharmacology*, 1969(Feb), Vol. 18(2), 339-346.—Narcotic analgesics effectively inhibit the binding of Ca^{2+} to phospholipids in vitro. Morphine and nalorphine also inhibit the Ca^{2+} transported by phospholipids obtained from guinea pig brain subcellular fractions. The inhibition of Ca^{2+} transported was related to ionization of the drug and was compared with the analgesic potency of the narcotic drugs. About 69% of morphine- ^{14}C was bound to phosphatidic acid and this binding was inhibited by divalent ions (3–29%). Various CNS-acting drugs were also effective in inhibiting the transport of Ca^{2+} ions by phosphatidic acid. It is postulated that an alteration in the binding of ions to phospholipids within the neuronal membrane may be involved in the pharmacological action of CNS-acting drugs. (27 ref.)—*Journal abstract*.

7685. Naik, Suresh R., Gokhale, Shrikant V., & Chittal, Shashikant M. (Seth G.S. Medical Coll., Pharmacology Research Unit, Bombay, India) **Effect of analeptics on brain pentobarbital levels and sleeping time in mice.** *Biochemical Pharmacology*, 1969(Aug), Vol. 18(8), 2038-2040.—For some time analeptics have been used as drugs of choice in the treatment of barbiturate poisoning. It has been observed that female white mice, given hexobarbital and nikethamide simultaneously, have shown sleeping time increases. This observation was extended following an examination of brain barbiturate levels in 3 Ss, using pentobarbital as the depressant and nikethamide, pentylentetrazol, and picrotoxin as analeptics. (15 ref.)—*B. A. Stanton*.

7686. Neimegeers, C. J., Verbruggen, F. J., & Janssen, P. A. (Janseen Pharmaceutica, Beerse, Belgium) **The influence of various neuroleptic drugs on noise escape response in rats.** *Psychopharmacologia*, 1970, Vol. 18(3), 249-259.—Studied the effects of 20 neuroleptic drugs on noise escape behavior in 90 female Wistar rats trained to interrupt an aversive noise (95 db. recycling every 20 sec.) by jumping, in a shuttle box, from 1 compartment into the other. All 20 drugs prolonged the latency (T) and reduced the frequency (F) of the noise escape response rate. For all compounds tested, T was more sensitive to drug effect than F. As far as potency was concerned, there was a good correlation ($r = .974$) between the F-900 values of the noise escape test and the ED_{50} values in the non-discriminated Sidman avoidance test in Ss and, as far as sedative properties were concerned, between the F 45/T900 ratio and the palpebral ptosis/cataplexy ratio ($r = .960$) of the observation test in Ss. (21 ref.)—*Journal abstract*.

7688. Rohte, Oskar. (Research Lab., Helsingborg,

Sweden) **Observation of the grooming behavior of reserpine white mice as a method for investigating reserpine antagonism and synergism.** *Psychopharmacologia*, 1970, Vol. 18(2), 154-161.—The grooming movements of reserpine white mice, dusted with pulverized charcoal, were studied under the influence of psychotropic drugs. Desipramine, d-amphetamine, and LEO 640 (a new potential antidepressant) showed positive results in this test and stimulated the grooming movements again. The results were compared with those obtained in the reserpine-temperature and the ptosis tests for mice.—*Journal abstract*.

7689. Senault, B. (Le Brun Lab., Aubervilliers, France) **Comportement d'agressivité intraspécifique induit par l'apomorphine chez le rat.** [Induction of intraspecific aggressive behavior with apomorphine in the rat.] *Psychopharmacologia*, 1970, Vol. 18(3), 271-287.—Apomorphine (1 mg/kg iv) has been found to induce aggressive behavior in rats. Having studied the influence of several factors (auditory stimulus, drug dosage, age, sex, strain, and cage size), an experimental design was adopted. 3 populations were distinguished among the 1524 pairs of Wistar rats studied, including those with (a) no aggressive behavior; (b) moderate aggressive behavior; and (c) severe, long-lasting, and reproducible aggressive behavior. The aggressive behavior induced by apomorphine was not correlated with that induced by electrical stimulation nor with that induced by killing mice. Several psychotropic drugs antagonized this action: neuroleptics (except reserpine), tranquilizers (chloridazepoxide, diazepam, meprobamate, hydroxyzine), morphine, and atropine. (24 ref.)—*English abstract*.

7690. Sofia, R. Duane. (Union Carbide Corp., Tuxedo, N.Y.) **Comparison of two methods for measuring drug-induced neurotoxicity.** *Journal of Pharmaceutical Sciences*, 1969(Jul), Vol. 58(7), 900-901.—Describes a series of experiments in which a rotating and a stationary rod procedure were used to determine the neurotoxic effect of various depressant and antidepressant agents in Swiss-Webster male mice and male hooded Long-Evans rats. Results reveal that the rotating rod technique is more sensitive in detecting drug-induced changes in performance. Observed differences between the 2 methods were more striking in mice than in rats.—*Journal abstract*.

7691. Sofia, R. Duane. (Pharmakon Lab., Scranton, Pa.) **Effects of centrally active drugs on four models of experimentally-induced aggression in rodents.** *Life Sciences*, 1969(Jul), Vol. 8(13, Pt. 1), 705-716.—Used 4 models of experimentally-induced aggression in male hooded Long Evans rats to determine the effectiveness of various centrally active compounds. Comparison of effective doses to those causing evidence of neurotoxicity revealed that no 1 drug or class of drugs was consistently effective in the 4 models presented. Only thiazesim in isolated mouse aggression, thioridazine, clomacran, chloridazepoxide, and diazepam in the electric shock-induced fighting, and imipramine and desipramine in the muricidal rat assay exhibited selective activity. No drug significantly reduced septal-lesion aggression in Ss. (25 ref.)—*Journal summary*.

7692. Squire, L. R., Gluck, S. D., & Goldfarb, J. (U. California, San Diego) **Relearning at different times after training as affected by centrally and peripherally acting cholinergic drugs in the mouse.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 41-45.—Tested 585 Charles

reaction. After administration of the blocking agent in amounts ranging between 5-50 mg/kg body weight the viscerovisceral reactions were inhibited, whereas the behavioral arousal remained. (2 p. ref.)—*Journal abstract*.

7677. Loh, Horace H., Shen, Fu-Hsiung, & Way, E. Leong. (Wayne State U.) **Inhibition of morphine tolerance and physical dependence development and brain serotonin synthesis by cycloheximide.** *Biochemical Pharmacology*, 1969(Dec), Vol. 18(2), 2711-2721.—Mice were rendered tolerant to and physically dependent on morphine by daily subcutaneous injections of increasing doses of morphine for 3 wk. The degree of tolerance was determined by measuring the increase in the median analgesic dose of morphine in relation to response to thermal stimulus, and dependence was determined by the precipitation of withdrawal jumping with the antagonist, naloxone. The concomitant daily administration of cycloheximide with morphine prevented the development of tolerance and physical dependence. The increase in brain serotonin turnover, which was noted to accompany development of tolerance and physical dependence, was also blocked. Findings suggest that the 3 responses to morphine may be closely related. (19 ref.)—*Journal abstract*.

7678. Maj, J., Grabowska, M., & Kwiek, J. (Polish Academy of Sciences, Inst. of Pharmacology, Cracow) **The effect of disulfiram, diethyldithiocarbamate and dimethyldithiocarbamate on serotonin and 5-hydroxyindole-3-acetic acid brain levels in rats.** *Biochemical Pharmacology*, 1970(Aug), Vol. 19(8), 2517-2519.—Investigated the activity of disulfiram (DS), diethyldithiocarbamate (DE), and dimethyldithiocarbamate (DM) on cerebral serotonin (5-HT) and catecholamine (C) levels. Ip injections of 3% DS suspensions were given 3 times at 2-hr intervals to albino Wistar rats, while DE and DM (in saline) were given in single doses. Ss were sacrificed 3 hr. following DS injections, or 2 hr. following DE or DM injections. 5-HT and 5-hydroxyindole-3-acetic acid (5-HIAA) levels were determined using the Ansell and Beeson method. Results indicate that only 2 significant changes occurred: (a) DE (250 mg/kg) increased 5-HIAA content to 143%, and (b) DE (500 mg/kg) lowered 5-HT content to 75%. It is concluded that DS, DE, and DM do not effect 5-HT levels in rat brains. (17 ref.)—*B. A. Stanton*.

7679. Mal'chikova, L. S. & Poskonova, M. A. (Moscow State U., USSR) **Vliyaniye adrenalina i adenilovyykh nukleozidov na spontannuyu aktivnost' i atsetilkholinovuyu kontrakturu gladiikh myshts.** [Influence of adrenaline and adenylnucleotides on the spontaneous activity and acetylcholine-induced contraction of smooth muscles.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1378-1384.—Utilized the smooth muscles of frog gastric circular muscle and guinea pig taenia coli in a study of their reaction to the action of adenosine tri-, di-, and monophosphate, as well as of adrenaline. A definite similarity existed in the action of adrenaline and that of the adenylnucleotides on the spontaneous activity of smooth muscles, depressing such activity and relaxing the muscles. The adenylnucleotides effectuated their inhibitory influence through the beta-adrenoreceptors which serve as the substrate of adrenaline in its inhibitory effect on the smooth musculature. Adrenaline and the adenylnucleotides abolished or diminished the reaction to acetylcholine in the muscles studied. (English summary) (23 ref.)—*I. D. London*.

7680. Marcucci, F., Fanelli, R., Mussini, E., & Garattini, S. (Mario Negri Inst. of Pharmacological Research, Milan, Italy) **Effect of phenobarbital on the in vitro metabolism of diazepam in several animal species.** *Biochemical Pharmacology*, 1970(May), Vol. 19(5), 1771-1776.—Investigated the metabolic pathway by which diazepam is transformed in vitro by liver microsomes from control and phenobarbital-treated male Sprague-Dawley rats, albino Swiss mice, and albino guinea pigs. Increased diazepam metabolism resulting from phenobarbital treatment led to the formation of increased amounts of hydroxylated metabolites in mice, and of both hydroxylated and N-demethylated metabolites in rats. In guinea pigs pretreatment with phenobarbital produced only an increased formation of N-demethylated metabolite. In all the animal species considered, in addition to the increased diazepam metabolism, phenobarbital treatment led to a decreased recovery of diazepam from incubation medium.—*Journal abstract*.

7681. McCarroll, James E. (U. Arkansas) **Magnesium pemoline: Effects of high dosage on water maze performance by rats.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1567.

7682. Meyerson, Bengt J. & Lewander, Tommy. (U. Uppsala, Sweden) **Serotonin synthesis inhibition and estrous behavior in female rats.** *Life Sciences*, 1970(Jun), Vol. 9(12, Pt. 1), 661-671.—Estrogen and progesterone are normally required to activate estrous behavior (i.e., lordosis response) in ovariectomized rats. Previous data suggest that serotonergic pathways inhibit the hormone activated estrous behavior. The present results show that the tryptophan hydroxylase inhibitor p-chlorophenylalanine (PCPA, 350 mg/kg), but not p-propyldopacetamid (H 22/54, 500 mg/kg), can replace the progesterone treatment. The ability of PCPA to activate estrous behavior could be due to decreased serotonin biosynthesis in combination with loss of serotonin from storage sites caused by PCPA itself or a metabolite. A release is indicated by a significant inhibition of the estrogen + progesterone activated estrous behavior, if PCPA is preceded by the MAO inhibitor pargyline (25 mg/kg). No inhibitory effect was obtained when the order of the injections of the 2 drugs was reversed. No similar inhibition was caused by H 22/54 preceded by pargyline. The turnover of serotonin in brains of ovariectomized, hormone treated females was estimated by measuring the decrease in brain serotonin after inhibition of tryptophan hydroxylase with PCPA or H 22/54. No changes in turnover of brain serotonin were found after estrogen, estrogen + progesterone, or progesterone treatment.—*Journal summary*.

River Swiss albino male mice for retention of a spatial task 1, 7, or 14 days after training. Normal Ss exhibited savings after 1 or 7 days, but not after 14 days. Ss given physostigmine before the retention test were impaired 1 day after training, but exhibited savings at both 7 and 14 days after training. Neostigmine, a peripherally acting anticholinesterase, had no effect when administered alone 1 day after training. Methscopolamine, a peripherally acting anticholinergic agent, had no effect when administered alone, but antagonized the behavioral effects of physostigmine. It is concluded that both central and peripheral actions of physostigmine are necessary to affect performance in this task.—*Journal abstract.*

7693. Strada, S. J., Sanders-Bush, E., & Sulser, F. (Vanderbilt U., Medical School, Psychopharmacology Research Center) ***p*-Chloroamphetamine: Temporal relationship between psychomotor stimulation and metabolism of brain norepinephrine.** *Biochemical Pharmacology*, 1970(Sep), Vol. 19(9), 2621-2629.—Unlike amphetamine, *p*-chloroamphetamine causes a decrease in cerebral serotonin (5HT) in rats. This effect on 5HT metabolism persists after the psychomotor stimulation has subsided. A study with male Sprague-Dawley rats indicates that like amphetamine, however, *p*-chloroamphetamine exerted a marked effect on the metabolism of intraventricularly administered ³H-norepinephrine during the period of psychomotor stimulation. Thus, it markedly increased the level of ³H-norepinephrine and decreased that of the tritiated deaminated catechol and the deaminated-O-methylated metabolites Desipramine, which blocks the metabolism of amphetamine, prolonged both the pharmacological and biochemical effects caused by amphetamine. It is concluded that the psychomotor stimulation elicited by *p*-chloroamphetamine is associated with changes in the metabolism of brain norepinephrine and not of brain serotonin. (35 ref.)—*Journal abstract.*

7694. Teitelbaum, Harry A., Newton, Joseph E., & Gantt, W. Horsley. (Johns Hopkins U., Medical School, Pavlovian Lab.) **Effects of pentobarbital sodium anesthesia and neurohumoral agents on the cardiac orienting reflex.** *Conditional Reflex*, 1970(Jan), Vol. 5(1), 6-26.—Reports studies of the cardiac orienting reflex in 16 dogs, moderately anesthetized and awake. In the anesthetized Ss prominent transient heart rate decrease was commonly noted within 1 or 2 beats after the onset of various auditory stimuli, and less often after visual stimuli. This cardiac inhibition was neither as prominent nor as frequent in occurrence in awake Ss. The respiratory cycle at stimulus onset influenced the appearance and degree of heart rate decrease, with the greatest and most frequent decreases occurring during the expiratory phase. Atropine abolished the response. There was little evidence of habituation of this orienting response under anesthesia, although "waxing" and "waning" apparently related to minute-by-minute fluctuations in degree of unconsciousness, occurred. Findings are discussed in relation to neurophysiological and neuroanatomical correlates of orienting responses, hypotheses of orienting and attention, cardiovascular neurohumoral mediators. (44 ref.)—*Journal abstract.*

7695. Wahlström, Göran. (U. Uppsala, Sweden) **Sleep induction by progesterone and medroxyprogesterone in the canary.** *Acta Pharmacologica et Toxicologica*, 1968(Nov), Vol. 26(6), 583-596.—Employing a method by which canaries could choose

between light and darkness, the circadian rhythm of activity and rest were recorded, using waking up times as starting points of the circadian periods. Progesterone (300 mg/kg) and medroxyprogesterone (75 mg/kg) were given as single oral doses during the activity of circadian period number 0. The progestational agents were administered either during the 1st half of the activity (AM) or during the last half of the activity (PM) period. The changes induced in duration of activity and rest were very similar after the 2 progestational agents. In the AM-series, activity was decreased and rest was increased. Roosting in circadian period number 0 thus occurred earlier than expected. A sleep-seeking behavior was thus induced in the Ss. In the PM-series opposite results were obtained, i.e., activity increased and rest decreased. There was a linear regression between the time during the activity when progesterone or medroxyprogesterone was administered and the changes induced in duration of activity and rest. The regressions were similar for progesterone and medroxyprogesterone. The changes in the duration of the circadian periods were different after progesterone and medroxyprogesterone. Marked changes were seen only in the AM-series. After progesterone, circadian period number 0 and 1 were decreased. After medroxyprogesterone, circadian period number 0 was increased and circadian period number 1 slightly decreased. (17 ref.)—*Journal summary.*

CARDIOVASCULAR PROCESSES

7696. Blitz, P. S., Hoogstraten, J., & Mulder, G. (U. Amsterdam, Psychological Lab., Netherlands) **Mental load, heart rate and heart rate variability.** *Psychologische Forschung*, 1970(Sep), Vol. 33(4), 277-288.—"Several investigators have shown that diminished sinus arrhythmia can be seen as an indication of increased mental load. The present experiment deals with the influence of different levels of mental load, operationalized as the number of binary choices per minute, on the regularity of the heart rate. Also ... investigated [were] the influence of 4 different rest conditions on the regularity of the heart rate. The results show that sinus arrhythmia scores differentiate significantly between several levels of mental load, but heart frequency appeared to be an even better indicator. No significant differences were found between the 4 rest conditions. Stability over 3 subsequent measurement sessions was satisfactory, and reliability within the measurement periods was very high."—R. Gunter.

7697. Cohen, David H. & MacDonald, Robert L. (U. Virginia, Medical School) **Some variables affecting orienting and conditioned heart-rate responses in the pigeon.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 123-133.—Describes in Exp. I 40 white Carneaux pigeons' heart-rate orienting response to light—monotonic cardioacceleration that habituates rapidly with a more persistent long-latency acceleratory component. Intermittent footshock modified the response dynamics, producing a decelerative component. However, this effect persisted for a limited number of presentations. Exp. II examined the effects of preexposures to light or unpaired light and shock. Preexposures to light had no effect. However, preexposure to 40 lights and shocks produced an acquisition decrement. Exp. III investigated ITI. There was a direct relationship between mean ITI and response magnitude, indicating a trial-massing effect in cardiac

conditioning. Controlling head position was found to have no effect. (22 ref.)—*Journal abstract.*

7698. Dobrovolskaya, V. N. (Pavlov Inst. of Physiology, Leningrad, USSR) *Uroven' i kolebaniya kolichestva leikotsitov perifericheskoi krovi u sobaks raznymi svoistvami osnovnykh nervnykh protsessov.* [Level and fluctuations of the number of leucocytes in the peripheral blood of dogs with various properties of the basic nervous processes.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 509-515.—Ss were 24 3-8 yr. old dogs with different types of nervous systems. High average degree and larger fluctuations of leucocytic density were noted in Ss with a weak excitatory process, independently of other properties, and, among Ss with a strong excitatory process, those that were equilibrated and labile. Lower average degree and smaller fluctuations of leucocytic density were characteristic for unequilibrated and inert Ss with a strong excitatory process. The average degree of leucocytic density was higher in females than in males. The degree of fluctuations of leucocytic density was the same in males and females.—I. D. London.

7699. Finley, William W. (Children's Medical Center, Tulsa, Okla.) *The effect of feedback on the control of cardiac rate.* *Journal of Psychology*, 1971(Jan), Vol. 77(1), 43-54.—Examined effect of correct feedback (CF) and incorrect feedback (IF) of cardiac rate across 5 display (D) and 6 no-display (ND) trials. 10 human Ss were tested in each feedback condition. Results show that CF Ss significantly decreased their cardiac rate during D relative to ND and to D of the IF Ss. Skin conductance was positively correlated with cardiac rate during CF D, suggesting that CF Ss successfully decreased cardiac rate by adopting some sort of arousal or relaxation strategy. (24 ref.)—*Author abstract.*

7700. Galantsev, V. P. (Leningrad State U., USSR) *Rol' vagusnoi innervatsii v mekhanizme vznikeniya reflektornoi bradikardii u nyryayushchikh mlekopitayushchikh.* [Role of vagal innervation in the mechanism behind the emergence of reflex bradycardia in diving mammals.] *Nervnaya Sistema*, 1968, No. 9, 65-70.—Muskrats (*Ondatra zibethica* L), capable of remaining under water for 12 min., were used to study the role of the vagus nerve in changes observed in the functional state of the heart muscle upon diving. On plunging into water, an abrupt reflex bradycardia showed up (from an average of 310 contractions/min down to 44), produced by a change in vagal tonus. Reflex bradycardia was abolished with bilateral vagotomy in the cervical region or with injection of atropine (1 ml. of .1% solution), thereby excluding any vagal influence on the heart. Surfacing by the intact S led to an increase of pulse rate to 8-10% above the normal prior to diving. During this time, cardiac activity was not subjected to vagal inhibition.—I. D. London.

7701. Higgins, J. David. (Harvard Medical School, Boston, Mass.) *Set and uncertainty as factors influencing anticipatory cardiovascular responding in humans.* *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 272-283.—Monitored human heart-rate and vasomotor activity while 24 male undergraduates' expectancies concerning which of 2 stimuli would occur were manipulated. 1 stimulus demanded a button-press response while the other required the S not to respond. In 1 group this response served merely to detect the respond stimulus, while in a 2nd group it was given the added dimension of being a

RT response. In both groups cardiovascular activity leading up to stimulus onset was observed to be a function of stimulus uncertainty rather than a simple function of the respond stimulus' expectancy. It is concluded that anticipatory cardiovascular responding reflected the attentional requirements of the task rather than simple motor preparation. (21 ref.)—*Journal abstract.*

7703. Newton, Joseph E., Murphree, Oddist D., & Dykman, Roscoe A. (Veterans Administration Hosp., Neuropsychiatric Research Lab., North Little Rock, Ark.) *Sporadic transient atrioventricular block and slow heart rate in nervous pointer dogs: A genetic study.* *Conditional Reflex*, 1970(Apr), Vol. 5(2), 75-89.—2 behaviorally distinct strains of pointer dogs, 1 bred for nervousness (pronounced freezing, withdrawal behavior), the other bred for normal behavior, exhibited prominent differences in their heart rates and incidence of sporadic occurrences of atrioventricular (AV) heart block. Of 67 nervous-line dogs, 70% showed 2nd degree AV block on at least 1 occasion, and their heart rates averaged 65 bpm. Only 15% of 52 normal-line dogs displayed AV block (generally fewer instances/dog) and their heart rates averaged 110 bpm. 5th generation nervous-line puppies, 2-6 wk. old, exhibited occasional AV block even at heart rates averaging 183 bpm. The incidence and severity increased as the puppies aged. Dogs crossbred from 2nd and 3rd generation parents of the 2 main lines show intermediate incidences of AV block and intermediate heart rates. The incidence of AV block is predominant in females. This is interpreted as a sex-influenced, age-dependent, polygenic mode of inheritance. Humoral factors probably account for the sex-influence, and psychological stress also probably plays a role. No sex difference is noted in heart rates.—*Journal abstract.*

7704. Vainshtein, B. G. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) *K voprosu o proiskhozhdenii dykhatel'nykh voln vnutricherepnogo davleniya.* [On the origin of respiratory intracranial pressure waves.] *Fiziologicheskii Zhurnal SSSR*, 1969(Nov), Vol. 55(11), 1385-1392.—Used 50 cats and 21 dogs under nembutal narcosis to assess the importance of several major influences, in the formation of respiratory intracranial pressure waves. Under normal conditions these waves are due mainly to respiratory pressure waves originating in the superior cava, with those of arterial and inferior caval origin contributing little to formation of the respiratory intracranial pressure waves. ENVIRONMENT & STRESS

7706. Altukhov, G. V., Khruleva, L. N., Gritsyuk, R. I., & Tkachenko, P. A. (Inst. of Medicobiological Problems, Moscow, USSR) *Vliyaniye okhlazhdeniya razlichnoi*

stepeni i dlitel'nosti na vysshuyu nervnuyu deyatel'nost' i vegetativnye funktsii krysa. [Influence of duration and different degrees of cooling on higher nervous activity and autonomic functions in rats.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 788-793.—Studied the influence of prolonged and repeated cooling on CR activity, and its aftereffects. Hypothermal effects on motor alimentary CRs to sound were studied in 24 white rats. Cooling down to body temperatures of 21, 26, and 30° C was accompanied by depression of CR activity and autonomic functions. Depth and duration of the changes were a function of degree of cooling and, to a lesser extent, its duration. In 50% of the cases with cooling down to 30° C and in single instances with cooling down to 26° C, cooling had a stimulating action on CR activity during the revival period. Restoration of higher nervous activity started on the 2nd-3rd day, with complete restoration in 5-6 days. Such hypothermia produced more drastic changes in higher nervous activity, the general state, pulse, and respiration. Any stimulating effect that may be observed occurred only in single cases and was not served at all after maximal hypothermia. Cooling down to 26 and 30° C for 24 hr. and 21° C for 2 hr. produced no irreversible changes in higher nervous activity, autonomic functions, and general behavior.—*I. D. London.*

7707. Bokhor, B. B. & Voinova, I. I. (Inst. of Medicobiological Problems, Moscow, USSR) **Vliyaniye poverkhnostnoi gipotermii na protsessy tormozheniya v vestibulyarnom analizatore.** [Influence of surface hypothermia on the processes of inhibition in the vestibular analyzer.] *Fiziologicheskii Zhurnal SSSR*, 1970(Apr), Vol. 56(4), 570-574.—Ss were 52 rats, several of which were subjected to extirpation of the temporal-parietal lobe of the cerebral cortex. Angular acceleration arising on stoppage of uniform rotation served as stimulus of the vestibular apparatus. Body cooling to 30° C slowed down extinction of the nystagmic reflex on repeated rotation. Transition from normal body temperature to surface hypothermia was accompanied by complete disinhibition of earlier extinguished nystagmus. The observed effects are viewed as the result of enhanced functional activity of the brainstem reticular formation during cooling. (English summary) (19 ref.)—*I. D. London.*

7708. Fantalova, V. L. (Inst. of Neurosurgery, Moscow, USSR) **O razlichnykh formakh reaktsii na proizvol'no usilennoe dykhanie.** [On different forms of reaction to voluntary deep breathing.] *Fiziologicheskii Zhurnal SSSR*, 1970(Apr), Vol. 56(4), 632-639.—2 Ss, exhibiting 2 distinctly different forms of reaction to hyperventilation (1 and 2 min.), and an additional 25 Ss (16-54 yr. old) participated in a study of the effects of momentary hyperventilation, utilizing simultaneous respiratory, digital plethysmographic, and EEG recordings. Typical of the 1st distinct variant are atactic breathing and an increase in peripheral blood supply, accompanied by evidence of hypersynchronization of cortical rhythms in the EEG. In the 2nd distinct variant, a stable increase in the amplitude of respiratory movement and a decline in peripheral blood supply appeared without evidence of hypersynchronization in the EEG. Both variants were distinguished also by the degree of change in pH of the blood and by the reports of subjective sensations. (English summary)—*I. D. London.*

(Bowling Green State U.) **Conditioned fear and gastric pathology in a continuing stress-rest paradigm in rats.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 20-22.—Examined the hypothesis that ulceration in a continuing stress-rest paradigm may be suppressed as a function of the addition of conditioned fear to the rest period. Rest periods were modified by presenting 90 male Long-Evans rats with tones which were paired with shock during stress periods. The conditioned-fear group did not differ from the other groups in number of ulcers, but lost less weight ($p < .01$) than control groups which received no conditioned tones during the rest periods. Findings are consistent with previous research which failed to demonstrate that conditioned fear affects the development of gastric ulceration.—*Journal abstract.*

7710. Hörmann, H., Mainka, G., & Gummlich, H. (Ruhr U., Inst. of Psychology, Bochum, W. Germany) **Psychische und physische Reaktionen auf Geräusch verschiedener subjektiver Wertigkeit: Zeitweilige Hörschwellenverschiebung und Elektromyogramm.** [Psychological and physiological reactions to noise of different subjective valence: Temporary threshold shift and electromyogram.] *Psychologische Forschung*, 1970(Sep), Vol. 33(4), 289-309.—Hypothesized "that physiological and psychological reactions to noise are not independent from one another. 2 groups of Ss were exposed to an identical tape of interrupted white noise of 95 db. For Group A noise was the signal that they had made an error in a pseudo-tracking task; for the other group (B) the same noise was the signal that they were on target in the pseudo-tracking task. A 3rd group (C) of Ss heard the same noise without any task. The dependent variables were: (a) temporary threshold shift (TTS), (b) muscle tension as measured by electromyography, and (c) subjective scaling of the amount of annoyance and disturbance induced by the noise and of the general sensitivity for noise of the S. Results: Ss who invest the noise with a positive emotional valence feel themselves less disturbed, less annoyed and in general less susceptible to noise than Ss who receive the same noise with negative valence. Muscle tension is highest for Group A, less for Group B, least for Group C. The amount of TTS is dependent upon the valence of the noise; noise with negative valence results in a TTS of 18.1 db, whereas noise of neutral or positive valence leads to a TTS of only 11.0 resp. 12.8 db. The results are discussed in relation to noise research and to activation theory and detection theory."—*R. Gunter.*

7711. Lidberg, Lars & Levi, Lennart. (Lab. for Clinical Stress Research, Stockholm, Sweden) **Anxiety and the endocrine system.** *Australian & New Zealand Journal of Psychiatry*, 1969, Vol. 3(3-A), 202-206.—Describes 4 studies on: (a) sympatho-adrenomedullary responses during pleasant and unpleasant emotional states (Ss were 20 young female office clerks who viewed bland, tragic, and comic films), (b) central nervous function and sympatho-adrenomedullary response (Ss were 20 patients with Ménière's disease, and the 20 Ss from the previous study were controls), (c) life stress and sympatho-adrenomedullary activity (Ss were stutterers speaking in public and nonstutterers as controls, and 20 young men in police custody and awaiting trial; all were subjected to a 2-hr relaxed condition followed by 2 hr. during which they were repeatedly asked to read texts and describe TAT pictures projected onto a screen), and (d) long-term stress and thyroid activity (Ss were 31

military Ss who had to perform uninterruptedly on an electronic shooting range during 3 days and 3 nights; 32 Army officers were Ss in another, similar experiment). Results from all studies indicate "that situations that evoke anxiety, both in the laboratory and real life, are capable of provoking marked endocrine reactions, which may even be of pathogenic significance." (18 ref.)—*M. Maney*.

7712. Mikhail, A. A. (U. Manitoba, Winnipeg, Canada) **Effects of acute and chronic stress situations on stomach acidity in rats.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 23-27.—Tested the effects of acute (Exp. I) and chronic (Exp. II) conditioned fear on gastric acidity in pylorus-ligated female Sprague-Dawley rats. Exp. I indicated that the acidity of 10 Ss exposed to conditioned fear during 14 hr. of accumulation of gastric juice was not significantly different from that of 10 controls. In Exp. II it was found that 16 Ss from 2 experimental groups which received 7 days of stimulation by light and shock followed by further stimulation during 14 hr. of pylorus ligation had significantly lower gastric acidity than 8 control Ss. These observations support the view that the sympathetic activity associated with fear-provoking situations, particularly chronic ones, suppresses rather than promotes gastric acidity. 7719. Thiessen, D. D. (U. Texas) **Reply to Wilcock on gene action and behavior.** *Psychological Bulletin*, 1971(Feb), Vol. 75(2), 103-105.—Replies to J. Wilcock's (see PA, Vol. 43:12595) review of single-gene studies of behavior in which he evaluates most studies as "trivial" in that they concentrate on obvious peripheral mechanisms without deep psychological meaning. It is argued that the evaluation neglects that: (a) peripheral mechanisms often account for much of the normal range of variation, (b) single genes can be used to preset physiological parameters, and (c) simple explanations can prevent premature neurologizing. (19 ref.)—*Journal abstract*.

7720. Wilcock, John. (U. Birmingham, England) **Gene action and behavior: A clarification.** *Psychological Bulletin*, 1971(Feb), Vol. 75(2), 106-108.—Replies to D. D. Thiessen's (see PA, Vol. 45:Issue 5) criticism of J. Wilcock's (see PA, Vol. 43:12595) review of single-gene studies of behavior, in which a number of methodological points are raised. It is argued that the previous paper was intended not as a contribution to methodology, but as a critique of empirical findings and their implicit or explicit interpretations.—*Journal abstract*.

PERSONALITY CORRELATES

NUTRITION & GASTROINTESTINAL PROCESSES

7721. Borisova, R. P. (Inst. of Sanitation & Hygiene, Leningrad, USSR) **Vliyanie razdrazheniya interotseptorov zheludka i slepoi kishki na bioelektricheskuyu aktivnost' skeletnykh myshts.** [Influence of stimulation of the gastric and cecal interoceptors on the bioelectrical activity of skeletal muscles.] *Fiziologicheskii Zhurnal SSSR*, 1966(Feb), Vol. 52(2), 188-194.—Employed rabbits with chronic gastric and cecal fistula to study the influence of balloon stimulation of the interoceptors of different parts of the gastrointestinal tract on the bioelectrical activity of skeletal muscles (gastrocnemius and anterior tibial). Stimulation of the interoceptors of the stomach and cecum caused a considerable change in the distension evoked bioelectrical activity of the leg muscle antagonists. Stimulation of the gastric interoceptors elicited primarily inhibition of the bioelectric activity of the muscles; that of the cecal interoceptors exerted both an inhibitory and stimulatory influence. It is concluded that the inhibitory or stimulatory effect of interoceptive stimulation is a

function of level of initial bioelectrical activity of the muscle.—*I. D. London.*

7722. Deaux, Edward & Kakolewski, Jan W. (Antioch Coll.) **Character of osmotic changes resulting in the initiation of eating.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 248-253.—Presents evidence regarding the systemic cue of lowered body-fluid osmolality in the initiation of eating. In 40 female albino Holtzman and 60 male albino partially hydrated rats the latency to eating and serum osmolality are inversely related to the volume consumed. The preference for eating increases with an increased level of hydration. With unlimited water available the rat prefers to rehydrate before engaging in food consumption. Results are discussed in terms of a model relating preferred consummatory responding to the internal state of the body-fluid osmolality.—*Journal abstract.*

7723. Kas'yanov, V. M. (Lenin Pedagogical Inst., Moscow, USSR) **Soderzhanie medli v slyune okoloushnykh zhelez s uchëtom parnosty ikh raboty.** [Copper content in the saliva of the parotid glands with due consideration of their joint function.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 886-888.—Used 3 dogs in a polarographic study of bilateral effects on salivary copper content of elaborating alimentary CRs to sound, light, and dermatactile stimulation. A number of asymmetrical effects are noted. The largest asymmetrical concentration of salivary copper was observed in the right gland when the stimulus was dermatactile. The impossibility of fine cortical regulation of copper content in the secretory process is attributed to the minuteness of the quantities of copper involved and leads to an instability in the disclosed forms of asymmetry.—*I. D. London.*

7724. Kosenko, A. F. (Shevchenko State U., Kiev, USSR) **Rol' bluzhdayushchikh i chrevnykh nervov v peredache vliyaniy gipotalamusa na sekretnuyu zheludka.** [Role of the vagus and splanchnic nerves in the transmission of hypothalamic influences on gastric secretion.] *Fiziologicheskii Zhurnal SSSR*, 1966(Feb), Vol. 52(2), 179-183.—Employed 4 dogs with isolated stomach pouches to study (a) the character of the influences resulting from electrical stimulation of different parts of the hypothalamus on the secretory activity of the stomach during digestion under conditions of chronic experiment, and (b) the importance of the vagus and splanchnic nerves in the transmission of hypothalamic influences on the 1st and 2nd phase of gastric secretion. Stimulation of different parts of the hypothalamus caused a change in gastric secretion in response to food. With stimulation of the anterior and middle parts of the hypothalamus, influences on gastric secretion were transmitted chiefly by the nervous route. Influences, mainly exciting gastric secretion and partially inhibiting it, were transmitted through the vagus nerves; influences, mainly inhibiting gastric secretion, were transmitted through the splanchnic nerves. With stimulation of the posterior part of the hypothalamus, the influences on gastric secretion were mediated by the humoral route.—*I. D. London.*

7725. Maier, Steven F., Zahorik, Donna M., & Albin, Richard W. (U. Illinois) **Relative novelty of solid and liquid diet during thiamine deficiency determines development of thiamine-specific hunger.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 254-262.—Previous experiments have found that thiamine-deficient Ss prefer new solid diets to the diet

present during deficiency but do not prefer new liquids to the liquid present during deficiency. That is, thiamine-specific hunger has been shown for solid diets but not for liquids. In these experiments the familiarity of the liquid and solid was not equated. Using 64 male Holtzman rats, the novelty of the liquid and solid diet present during thiamine deficiency was varied. It was found that the degree of new liquid preference by thiamine-deficient Ss depended on the novelty of both the liquid and solid present during deficiency. Parallel results were found for solid-diet preferences. The relevance of these results for a learned-aversion interpretation of thiamine-specific hunger is discussed. (17 ref.)—*Journal abstract.*

7726. Udalova, G. P. (Leningrad State U., USSR) **Vliyaniye khimicheskogo razdrazheniya retseptorov tonkogo kishechnika na élektricheskuyu aktivnost' gipotalamusa i dvigatel'noi oblasti kory bol'shikh polusharii u kryss.** [Influence of chemical stimulation of the small intestinal receptors on electrical activity of the hypothalamus and motor region of the rat cerebral cortex.] *Nervnaya Sistema*, 1968, No. 9, 103-108. Ss were 32 nembutalized rats with prepared small intestinal loops (4-5 cm. in length). The study utilized, for 10-25 sec., the following stimuli on the small intestinal receptor field: solutions of NaCl, HCl, and glucose; water; and a physiological solution. Changes emerged in the electrical activity of several hypothalamic nuclei in response to the stimulation of small intestinal receptors by chemical solutions. The electrical responses were expressed either in a transformation of spontaneous rhythm or in the appearance of a series of potentials with diverse configurations (amplitude of 50-150 microV, and duration of 50-200 msec.). Adequate stimulation of the small intestinal chemoreceptors produced in the motor cortical region bioelectrical reactions, by way of response, in the form of changes in spontaneous activity or the appearance of evoked potentials.—*I. D. London.*

ANIMAL PSYCHOLOGY

COMPARATIVE PSYCHOLOGY

7728. Collins, William E., et al. (FAA, Civil Aero-medical Inst., Oklahoma City, Okla.) **Some characteristics of optokinetic eye-movement patterns: A comparative study.** *Aerospace Medicine*, 1970(Nov), Vol. 41(11), 1251-1262.—Optokinetic stimulation of parrots and cats showed that both slow-phase displacement and frequency of eye movements increased during the initial 18 sec. or more of stimulation before leveling off. There was no significant difference between right- and left-beating responses. Cats were studied more extensively and showed no clear adaptation effects for stimuli up to 2 min. in duration. Cats also displayed a smoothly declining afternystagmus (in the dark) following stimulus termination; this response consistently gave way to a secondary nystagmus, the magnitude of which did not seem to be affected by the longer stimulus durations. Vertical nystagmus from cats was less regular and could be obtained consistently only in a down-beating direction. Human Ss showed no consistent

directional differences in either horizontal or vertical optokinetic nystagmus but differed from the cats in that no build-up period was evident, a sharp drop in nystagmus followed stimulus termination, the output of afternystagmus tended to be greater following longer durations of stimulation, and secondary responses were both infrequent and weak. Some striking but apparently normal asymmetries in the vertical responses of humans were noted. (34 ref.)—*Journal abstract*.

(FAA, Civil Aero-medical Inst., Oklahoma City, Okla.) **Some characteristics of optokinetic eye movement patterns: A comparative study.** *FAA Office of Aviation Medicine Report*, 1970(Jul), No. 70-10, 29 p.—Optokinetic stimulation of parrots, dogs, and cats showed that both slow-phase displacement and frequency of eye movements increased during the initial 18 sec. or more of stimulation before leveling off. There was no significant difference between right- and left-beating responses. Cats, studied more extensively, showed no clear adaptation effects for stimuli up to 2 min. in duration. Cats also displayed a smoothly declining afternystagmus (in the dark) following stimulus termination; this response consistently gave way to a secondary nystagmus, the magnitude of which did not seem to be affected by the longer stimulus durations. Vertical nystagmus from cats was less regular and could be obtained consistently only in a down-beating direction. Human Ss showed no consistent directional differences in either horizontal or vertical optokinetic nystagmus but differed from the cats in that no build-up period was evident, a sharp drop in nystagmus followed stimulus termination, the output of afternystagmus tended to be greater following longer durations of stimulation, and secondary responses were both infrequent and weak. Some striking but apparently normal asymmetries in the vertical responses of humans were noted. (32 ref.)—*Author abstract*.

7730. Fox, M. W. (Washington U.) **Ontogeny of prey-killing behavior in Canidae.** *Behaviour*, 1969, Vol. 35(3-4), 259-272.—Observed hand-raised foxes, wolves, coyotes, and dogs in their responses to live rats and mice. "Movement of the prey was a strong stimulus to all canids, eliciting orientation, approach and attack. These reactions occurred earliest in ontogeny, followed by seizure of the prey and carrying to a safe or quiet place. Consummatory eating in the wolf and grey fox appeared to be triggered by blood."—*N. M. Ginsburg*.

7731. Fox, M. W. (Washington U., St. Louis) **The anatomy of aggression and its ritualization in Canidae: A developmental and comparative study.** *Behaviour*, 1969, Vol. 35(3-4), 242-258.—Observed conspecific interactions of pairs of foxes, wolves, coyotes, and dogs. "Piloerection and back arching were present in all species.... The orientation of attack was almost exclusively directed at the cheek in the grey fox, but in other canids the shoulder hackle area, throat and muzzle area were also attacked; prolonged bouts of jaw-muzzle wrestling occurred in the wolf, scruff-wrestling in wolf and coyote and dog, and cheek-wrestling in the grey fox.... Orientation of attack was correlated with distinctive body markings."—*N. M. Ginsburg*.

7732. Gruber, Howard E., Girus, Joan S., & Banuazizi, Ali. (Rutgers State U., Inst. for Cognitive Studies) **The development of object permanence in the cat.** *Developmental Psychology*, 1971(Jan), Vol. 4(1, Pt. 1), 9-15.—Modified Piaget's methods of studying object permanence in children to form 8 behavioral tests

suitable for cats. 12 laboratory-reared kittens and alley cats served as Ss. It was found that Ss reached an early developmental limit. Unlike children, they were unable to follow an object through a series of invisible displacements. 7 house-reared Ss showed similar limitations, but advanced more rapidly than cage-reared Ss. A longitudinal study with 3 house-reared litter mates suggests that cats go through 4 stages rather than the 6 found by Piaget in children. In the 1st 24 wk. of life, kittens develop as far as children do in their 1st yr., but the child's behavior with respect to vanished objects eventually becomes more complex and more general.—*Journal abstract*.

7733. Harper, Lawrence V. (U. California, Davis) **The young as a source of stimuli controlling caretaker behavior.** *Developmental Psychology*, 1971(Jan), Vol. 4(1, Pt. 1), 73-88.—Reviews the effects of mammalian offspring on their caretakers, following a general classification system in which the offspring are seen as providing exogenous stimuli which facilitate (trigger, sensitize, orient) or inhibit (check, desensitize, disorient) caretaker behavior. Comparative studies provide well documented examples of general offspring-stimulus effects. The application of the same behavior analysis to parent-offspring relations in man is suggested. (4 p. ref.)—*Journal abstract*.

7734. Layne, James N. (American Museum of Natural History, New York, N.Y.) **Nest-building behavior in three species of deer mice, Peromyscus.** *Behaviour*, 1969, Vol. 35(3-4), 288-303.—Compared Florida, cotton, and wood mice on the "basis of amount of cotton removed daily from a dispenser and the type of nest built, and... their tendency to shred paper strips. Floridanus removed less cotton and built poorer nests than the other species.... Laboratory conceived and reared Ss of floridanus and gossypinus performed more poorly and more variably in these tests than wild-caught individuals.... Floridanus did less shredding than gossypinus... Laboratory Ss of both species tended to do more shredding than field animals."—*N. M. Ginsburg*.

7735. Maurinya, Kh. A. (Ed.) **Voprosy biologii.** [Problems of biology.] Riga, USSR: Zinatne, 1969, 267 p.—Contains 4 articles on human and animal physiology, 1 of which is devoted to a study of the autonomic components of the anxiety reaction in situational neuroses.—*I. D. London*.

7737. Sanders, Barbara. (U. Colorado) **Factors affecting reversal and nonreversal shifts in rats and children.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 192-202.—Trained 20 2nd grade children (Exp. I), 20 preschool children (Exp. II), and 16 naive brown male rats (Exp. III) on sequential discriminations analogous to reversal-nonreversal (R-NR) shifts, but without a basis for dimensional mediation. Population differences paralleled those obtained in actual R-NR studies and suggest that 1 factor which may contribute to the R-NR results is the spontaneous abandonment by older children of 1 previously rewarded response following nonreward of another previously rewarded response. Preschool Ss "spontaneously shifted" in this situation when the 1st postshift nonreward was accompanied by verbal instruction (Exp. IV). In an actual R-NR situation (Exp. V), although more instructed than noninstructed preschoolers spontaneously shifted, criterion performance in both groups depended

upon training dimension. Results are consistent with a theory in which dimensional mediators are assumed for rats and younger children as well as for older human Ss. (18 ref.)—*Journal abstract.*

NATURAL OBSERVATION

7739. Nogge, G. & Staack, W. (Inst. angewandte Zoologie, Bonn, W. Germany) **Das Flugverhalten der Dasselfliege (*Hypoderma Latreille*) (Diptera, Hypodermatidae) und das Bienen der Rinder.** [Flying behavior of the warble-fly and the panicking of cattle.] *Behaviour*, 1969, Vol. 35(3-4), 200-211.—Investigated the flight-sound by a $\frac{1}{3}$ octave analyser, and the oviposition-flight by slow motion filming. "Flying speed is 8-9 m/sec, the wing-stroke frequency 450 Hz.... Oviposition itself takes place in .2-.3 sec. After 1 attack, consisting of 3-6 ovipositions, a short rest follows.... The female may oviposit all her eggs within 2.5-3 hr.... The cattle react with panic on the flies' behaviour and take to flight. After some experience the flight-sound, as recorded by a tape, is able to induce fleeing."—N. M. Ginsburg.

EARLY EXPERIENCE

7740. Abel, Ernest L. (U. Toronto, Ontario, Canada) **Habituation as a factor in early handling.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 219-221.—Either handled or carried 48 Long-Evans hooded rats in their home cages during infancy. As adults, they were placed in an open field either by handling or by tipping them out of their cages. Infant handling was shown to affect latency to move in the open field only when handling occurred immediately prior to testing. Results are discussed in terms of habituation.—*Journal abstract.*

7741. Fox, M. W. (Washington U.) **Behavioral effects of rearing dogs with cats during the "critical period of socialization."** *Behaviour*, 1969, Vol. 35(3-4), 273-280.—Raised 4 pups singly with a litter of 4-6 kittens together with their mother, from 25 days to 16 wk. old. A series of tests were run on both experimental Ss and controls at 16 wk. Experimental Ss showed much less responsiveness to a mirror than controls. They played actively with strange cats but avoided other dogs. "Only cats with prior experience with a dog interacted socially with dog raised dogs while the latter always solicited play from cats."—N. M. Ginsburg.

7742. Tees, Richard C. (U. British Columbia, Vancouver, Canada) **Luminance and luminous flux discrimination in rats after early visual deprivation.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 292-297.—Trained 38 light- and 44 dark-reared hooded Long-Evans rats on 3 visual discrimination tasks. No significant difference due to rearing condition was observed in acquisition of an intensity discrimination in which both luminance and luminous flux differences were available and relevant. Stimulus equivalence tests revealed that the luminance differences were utilized by light-reared Ss in learning such a discrimination significantly more than by dark-reared Ss. Inferior performance by dark-reared Ss was obtained on a 2nd intensity discrimination in which only

luminance differences were relevant. No significant differences due to rearing condition were found in terms of acquisition or cue utilization on a luminous flux-size discrimination. Findings are discussed in terms of the effect of visual deprivation on selective attentional and information-processing mechanisms. (16 ref.)—*Journal abstract.*

7743. Wong, Roderick. (U. British Columbia, Vancouver, Canada) **Infantile handling and the extinction of responses acquired under food reward.** *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 702-706.—Compared the runway behavior of female Long-Evans rats which had been handled from Days 1-21 (N = 12) and their nonhandled litter mates (N = 12). The training began on Day 70 after Ss were habituated to a restricted food schedule for 10 days. Ss were given 6 trials each day in the runway and were rewarded with a .045-gm Noyes pellet. After 10 days of rewarded training trials, Ss were given 6 extinction trials a day for 10 days. Results show that handled Ss ran faster than nonhandled Ss during acquisition and during the 1st 3 days of extinction. Extinction data suggest that the relationship between emotionality and effects of frustrative nonreward should be reevaluated.—*Journal abstract.*

INSTINCTS

7744. Gardner, Louis E. & Ratner, Stanley C. (Creighton U.) **In-burrow behavior of earthworms.** *Psychological Record*, 1970(Sum), Vol. 20(3), 387-394.—Studied several classes of earthworm (*Lumbricus terrestris*) behavior in a 3-dimensional, seminatural habitat. Study I described the burrowing, foraging, feeding, and mating behavior of 5 Ss. Ss were exposed to light, air, and vibratory stimulation while in their burrows. Light and intermittent vibration consistently elicited responses while air was an ineffective stimulus. Study II with 8 Ss investigated the effects of a light-dark cycle and the time of day upon the amount of burrowing by the Ss. The light cycle did not affect the distance burrowed, but time of day did have a significant effect upon the amount of burrowing activity.—*Journal abstract.*

7745. Hailman, Jack P. (U. Wisconsin) **How an instinct is learned.** *Scientific American*, 1969(Dec), Vol. 221(6), 98-106.—Investigated the hypothesis that "stereotyped behavior patterns of animals also require subtle forms of experience for development." The feeding behavior of laughing and herring sea gull chicks was studied in both a natural and laboratory environment. Results show that the newborn chick reveals a poorly coordinated peck, motivated by hunger and elicited by the stimulus properties of shape and movement from a parent or sibling. The chick's aim and depth perception improves steadily through practice in pecking. Also, the chick's begging and feeding pecks become differentiated as it learns to rotate its head when begging from the parent. It is concluded that "behavioral development is a mosaic created by continuing interaction of the developing organism and its environment."—P. McMillan.

7746. Vaidya, V. G. (U. Poona, India) **Studies on the perception of colours in some Papilionidae (Lepidoptera): II. Inborn preferences for colours in the state of feeding.** *Acta Biologica Experimentalis*, 1968, Vol. 28(4), 401-407.—3 Papilionid species, *Papilio demoleus*, *Polydorus aristolochiae*, and *Graphium aga-*

memnon, with no previous color experience, were kept in a large outdoor cage. They were offered artificial flowers made out of the papers of the Otswald color series and the Bauman grey series. The insects showed characteristic feeding responses toward the flowers. A comparison of color preferences indicate that all 3 species preferred the purple and blue colors for feeding, and, to a lesser extent, the yellow and orange colors. These preferences were similar to those shown by the Pierids, but quite distinct from those shown by the Nymphalids.—*Journal summary*.

MOTIVATION & EMOTION

7747. Ewert, J. P. & Rehn, B. (Technische Hochschule, Darmstadt, W. Germany) **Quantitative Analyse der Reiz-Reaktionsbeziehungen bei visuellem Auslösen des Fluchtverhaltens der Wechselkröte (*Bufo viridis* Laur.)** [Quantitative analysis of stimulus-response relations in visual release of escape behavior in the toad.] *Behaviour*, 1969, Vol. 35(3-4), 212-234.—“Escape activity... was quantitatively studied as a function of the stimulus parameters of a visual enemy-dummy. A dummy coming from above... releases more reactions than 1 coming from the ground.... Escape activity increases with increasing contrast of the dummy against the background.” Stimulus velocity showed a maximum effect at 30°/sec, and stimulus size at 50°.—*N. M. Ginsburg*.

7748. Frieman, Jeanne P., Rohrbaugh, Michael, & Riccio, David C. (Kansas State U.) **Age differences in the control of acquired fear by tone.** *Canadian Journal of Psychology*, 1969(Aug), Vol. 23(4), 237-244.—Administered 10 inescapable shocks to 38 male Holtzman infant and adult albino rats in the presence of a 450-cps tone (CS) while Ss were confined in 1 compartment of a double-compartment shuttle box. Each S subsequently received 20 4-min trials (without shocks) in which a 230-, 450-, or 1000-cps tone, or no-tone, was made contingent upon S's presence in the former shock (fear) compartment. 8 Ss served as controls. Time spent avoiding the fear compartment during the various tone conditions revealed a steeper group gradient for pups than for adults, although mean avoidance of the CS condition was comparable for both groups. Individual stimulus generalization gradients were observed in 8 of 10 infants and 2 of 10 adults. Data are discussed in relation to the nature of maturational experience. 7752. Hsiao, Sigmund & Kendrick, Daryl. (U. Arizona) **Feeding-drinking interaction: Efficacy of saline solutions for ingestion of dry food in rats.** *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 62-67.—Deprived 30 female Wistar albino rats of food and

water for 24 hr. Ss were then given food and 1 of the following liquids: water; .3, .6, .9, and 1.8% NaCl solutions; or a condition with no liquid as the base-line level. Food and a liquid (or no-liquid) were presented for 2 hr. to measure intake. Results show that (a) Ss drank more isotonic saline (.9%) than other hypo- or hypertonic saline solutions; (b) Ss ate more food with water, and food intake declined as the accompanying solution increased in NaCl concentration; and (c) Ss drank more liquid to eat the same amount of food beyond the base-line level as NaCl in liquid increased. NaCl reduces the effectiveness of liquid in reducing thirst induced by ingestion of dry food. Increased intake of dilute saline solutions may be partly due to their reduced hydrating capability compared with water. (28 ref.)—*Journal summary*.

7753. Long, Charles J. & Stein, Gerald W. (Memphis State U.) **An analysis of the reinforcing properties of food odour.** *Canadian Journal of Psychology*, 1969(Jun), Vol. 23(3), 212-218.—Evaluated food-odor preference for 24 male albino rats in a double-lever situation where odor presentation and odor-offset were made contingent upon a lever press, or in a noncontingent situation, where no change in stimulus presentation was made contingent upon the lever press. All groups exhibited a significant odor preference, although the odor-onset elicited the greatest preference and the noncontingent situation the least. Results suggest that when odor-stimuli are made response-contingent, the increased probability of responding is due to directing, stimulus-changing, and conditioned-reinforcing properties of the stimulus. (French summary)—*Journal abstract*.

7754. Matthews, T. James. (New York U., Coll. of Arts & Sciences) **Thermal motivation in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 240-247.—Studied thermally motivated behavior under variations in 3 basic parameters; drive intensity, reinforcement duration, and reinforcement intensity. 5 naive male albino Norway rats were trained to press a bar to change the temperature of air in the experimental chamber from the drive temperature to the reinforcer temperature. Exp. I measured the effects of drive intensity and reinforcement duration with reinforcement intensity held constant at neutrality. Response speed increased sharply with increases in drive intensity but was very weakly affected by reinforcement duration. In Exp. II, variations in the reinforcement temperature between the drive temperature and neutrality did not affect response speed. Exp. III showed that variations in reinforcement intensity and reinforcement duration only affected response speed when the temperature of the reinforcer was on the opposite side of neutrality from the drive. With reinforcers beyond neutrality, response speed decreases with an increase in reinforcement intensity or duration.—*Journal abstract*.

LEARNING

7756. Hu, Baw-chyr. **Runway performances as a function of reinforcement schedule and alley length.** *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 125-134.—Reports studies designed to integrate 2 different kinds of learning, classical and instrumental con-

ditioning. 48 naive albino rats were trained to run to water in a straight alley, and randomly assigned to 6 groups. A factorial design was employed with 3 alley lengths (32, 8, and 4 in.) and 2 levels of reinforcement schedules. Starting and running speed were measured for each section of the runway. Analyses of variance indicate that starting speed was the most sensitive measure of all, since it yielded significant and consistent major effects. For the extinction performances, findings indicate a greater resistance to extinction under partial reinforcement schedule. Results also indicate that during the acquisition, the effect of the reinforcement schedule was significant in the shorter alley groups. Results are consistent with previous instrumental reward studies, i.e., the effects of variation of the reinforcement schedule in an instrumental conditioning situation may depend upon which portion of the response chain is measured. The prediction that the response latency depends on the response speed was also confirmed.—*Journal abstract.*

7758. Lachman, Sheldon J. (Wayne State U.) **Behavior in complex learning situations involving three levels of difficulty.** *Journal of Psychology*, 1971(Jan), Vol. 77(1), 119-126.—Solutions to multiple-choice problems involving 3 (N = 11), 4 (N = 9), and 5 (N = 7) elevated paths in which the order of elimination was determined by the S were learned by albino rats. The problem for the S was to choose different paths on successive runs, i.e., not to repeat a particular path on a day's trial. Each trial consisted of as many runs as there were paths plus the number of incorrect choices, i.e., path selections repeated. The criterion of learning was 4 successive errorless trials (days). For all problems: (a) Correct choices were made more rapidly than incorrect choices. (b) Ss did not stereotype in the sense of repeating the same pattern of choices on consecutive days, but rather chose different patterns on consecutive days. (c) Ss exhibited strong preferences for choosing successive pathways which diverged maximally from each other, i.e., Ss tended to select on a given run a pathway which was maximally different in terms of spatial orientation from the pathway chosen on the immediately previous run. Alternation in the 2-path problem is regarded as a specific instance of this general principle.—*Author abstract.*

7759. Mackintosh, N. J. & Little, Lydia. (Dalhousie U., Halifax, Nova Scotia, Canada) **Selective attention and response strategies as factors in serial reversal learning.** *Canadian Journal of Psychology*, 1969(Oct), Vol. 23(5), 335-346.—3 experiments investigated the basis of serial-reversal improvement in 40 white Carneaux pigeons. In the 1st, Ss trained on either color or position reversals alone performed more accurately than Ss initially trained on interspersed color and position reversals, and then shifted to 1 type of problem only. This suggests that the selective strengthening of attention to a single relevant dimension is 1 factor underlying rapid reversal learning. In 2 further experiments, Ss were trained on delayed conditional discriminations, the requirements of which were similar to those of a win-stay, lose-shift strategy. Ss' poor performance on these problems implies that such strategies do not play an important part in reversal learning in these Ss. (French summary)—*Journal abstract.*

7760. Manocha, Satinder N., Mills, John A., & Winocur, Gordon. (U. Toronto, Ontario, Canada) **The effects of concept training on interproblem transfer in rats.** *Canadian Journal of Psychology*, 1969(Oct), Vol. 23(5), 327-334.—Assigned 24 hooded rats, matched for intelligence on the Hebb-Williams maze, to 3 groups. Groups I and II were trained on 10 2-choice simultaneous discrimination problems (56 trials/problem); for Group I, positive discriminanda had the feature of curvature in common. Group III were untrained controls. On transfer to 10 unrelated discrimination problems (20 trials/problem), Group III ran at 50% correct. Group I was significantly superior to all other groups and Group II was significantly superior to Group III. It is concluded that training on related problems leads to a more efficient reduction of error tendencies than training on unrelated problems. (French summary) (21 ref.)—*Journal abstract.*

Conditioning

7762. Black, A. H. (McMaster U., Hamilton, Ontario, Canada) **Mediating mechanisms of conditioning.** *Conditional Reflex*, 1970(Jul), Vol. 5(3), 140-152.—Attempts to explain the connection between the discriminative stimulus (S^D) and the CR that is established by the conditioning procedure. 2 approaches to mediating mechanisms are discussed: (a) the peripheral mechanism approach which determines whether the occurrence of 1 CR is necessary for the occurrence of another; and (b) the central mechanism approach which considers the neural structures that underlie the CR, the specific changes in neural activity that occur in these structures when S^D is presented, and the temporal relationship among these changes. It is thought that the peripheral mechanism approach is less likely to provide useful information about the mechanisms underlying the CR than the central mechanism approach. Reasons for this are reviewed and experimental evidence is cited to support them. The central mechanism approach is discussed regarding experiments which analyze the relationship of hippocampal theta waves to CR. A new method for studying the central mechanisms of behavior, i.e., operant reinforcement of the central electrical activity, is described. It is concluded that, although the mechanisms underlying CR are not yet understood, this approach appears to be the most promising. (21 ref.)—*M. Maney.*

7763. Black, Roger W. (U. South Carolina) **Incentive motivation and the parameters of reward in instrumental conditioning.** *Nebraska Symposium on Motivation*, 1969, Vol. 17, 85-137.—Discusses the "role of reward and reinforcement in simple learning situations" involving instrumental and appetitive conditioning. Recent research on "reward," here considered interchangeable with "reinforcer," is presented. Charts showing the mean running speed and average rate of rats in a straight alley following various lengths of access to food reward, different amounts of reward, and number of reinforcements per trial are discussed in detail. It is concluded that: (a) "A primary mechanism of reinforcement seems to be incentive-motivational." (b) "The apparent reinforcement value of a reward appears to

depend not only on its magnitude or the amount of consummatory behavior it evokes but upon the consistency with which such behavior occurs." (c) "The 'sources of reward' appear to be multiple." Comments by E. L. Wike follow. (69 ref.)—*J. M. Roberts.*

7764. **Dmitriev, Yu. S.** (Pavlov Inst. of Physiology, Koltushi, USSR) **Rol' struktury stereotipa v skorosti obrazovaniya uslovnykh refleksov.** [Role of stereotypic structure in speed of formation of conditioned reflexes.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 257-260.—Used 32 rats, in groups of 8, to study the influence of the order of application of 2 CSs on the speed of formation and reversal of 2 electrodefensive CRs simultaneously in a T maze. 5 acoustic and 5 photic stimuli were employed in each experimental trial. In the 1st stereotype, CSs were applied in strict alternation and always started with an acoustic signal. In the 2nd stereotype, the conditioned signals were also alternated, but each succeeding experimental trial began with that CS, with which the preceding trial ended. In the 3rd stereotype, in the beginning, 5 acoustic stimuli were given in sequence, then 5 photic stimuli, with this order unchanging thereafter. But in the 4th stereotype, while repeating the blocks of stimuli, each succeeding experimental trial began with that sequence of stimuli, with which the preceding trial ended. The 1st CS was a bell signaling a turn to the right in order to escape painful electrostimulation; the 2nd CS was a light signaling a turn to the left to accomplish the escape. It was established that the elaboration and reversal of CRs are accomplished more quickly in rats. The growth of magnitude of the reflex from combination to combination in the experimental trials is viewed as the essential parameter of speed of reflex formation.—*J. D. London.*

7765. **Franchina, Joseph J., Sparling, Daniel L., & Chlipala, Ronald.** (Virginia Polytechnic Inst., Coll. of Arts & Sciences) **Effects of patterns of goal-box placements on the subsequent acquisition of instrumental response patterning.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 84-89.—Placed 64 male hooded naive rats either directly into the goal box of a runway or into a neutral box with either reward alone, nonreward alone, or both reward and nonreward presented in alternation or random sequences. In subsequent runway training, the acquisition of single-alternation (SA) running behavior was reliably facilitated following goal- or neutral-box placements with alternating reward and nonreward compared to all other procedures, acquisition being faster for goal- than neutral-box conditions. Placements with either nonreward alone or random reward and nonreward reliably facilitated subsequent SA learning over that for placements with reward alone in the goal- but not in the neutral-box condition.—*Journal abstract.*

7766. **Hitzing, E. Wade & Safar, Tibor.** (Kalamazoo State Hosp., Mich.) **Auto shaping: The conditions necessary for its development and maintenance.** *Psychological Record*, 1970(Sum), Vol. 20(3), 347-351.—Investigated the conditions necessary for the acquisition of key pecking. 12 naive white carneaux pigeons were tested during 2 sessions of 80 key light trials, 8 sec. in duration, presented on a noncontingent variable-interval 1" schedule. After 2 hopper-training periods the Ss were again presented with 2 sessions of key light only trials. Prior to hopper training none of the Ss pecked, but after training 8 Ss pecked within the 1st 2 trials, 1 pecked during the 16th trial and 1 during the

83rd trial. 2 never pecked the lit key. 4 Ss were then tested during sessions in which both the key light and hopper were presented but never paired (forward pairing). This procedure was not sufficient to maintain key pecking. Noncontingent forward-pairings of key light and hopper presentations resulted in both a reacquisition and maintenance of the key peck. It is concluded that pairing of the key light and hopper presentation is not necessary for acquisition of the key peck but is necessary to maintain the behavior.—*Journal abstract.*

7767. **Johnson, Donald & Anderson, D. Chris.** (U. Minnesota) **Acquisition of a second-order classically conditioned response.** *Canadian Journal of Psychology*, 1969(Jun), Vol. 23(3), 174-183.—Following alleyway food-training on a 50% random partial reinforcement schedule and 10 forward 1st-order (CS-UCS) conditioning trials elsewhere, forward 2nd-order (CS₁-CS₂) classical conditioning trials were initiated for 40 female albino rats (Group 1) and equivalent but backward (CS₁-CS₂) training was started for 20 additional Ss (Group 2). After each set of 2 CS₁-UCS and 3 CS₂-CS₁ trials (or 3 CS₂-CS₁ trials for Group 2) were given, the CS₂ was presented in the goal area of the alley on nonreinforced trials to assess its suppressing effect on total running times. While the performance of Group 2 to the CS₂ was unchanged as a function of conditioning trials, Group 1 evinced both increasing suppression and skin conductance levels as 2nd-order training progressed. Maximum suppression was obtained by the 12th CS₂-CS₁ trial. (French summary) (16 ref.)—*Journal abstract.*

7768. **Karas, A. Ya., & Yakimenko, O. O.** (Moscow State U., USSR) **Issledovanie mekhanizmov razlicheniya elementarnykh i slozhnykh priznakov pri opoznanii form u karpovykh ryb (Cyprinus carpio).** [Investigation of the mechanisms involved in discrimination of elementary and complex cues in the recognition of forms by carp (Cyprinus carpio).] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 404-409.—6 2.5-yr-old Ss were used to study (a) the mechanisms involved in the recognition of simple and complex cues (differently oriented lines and geometric figures, e.g., square, rectangle, triangle), and (b) the influence of kind of stimulus on signal recognition time. Various physiological mechanisms account for the discrimination of elementary and complex cues. The differentiation of elementary cues (variously oriented lines, e.g., 0, 25, 35, 45, 60, and 90°) developed with their simultaneous presentation (1 positive, 3 inhibitory), independently of their number (from 1 to 4). This can be seen by the fact that motor RT was not prolonged with an increase in the number of selected signals. Geometrical figures were distinguished by complex cues through a sequential analysis involving a mechanism of choice. This can be seen by the fact that recognition-time here was a function of the number of stimuli—evidence of signal choice. The speed of formation of the CR depends on the kind of stimuli. The CR is elaborated the most quickly to a horizontal line; the most slowly to an inclined line; in between for a vertical line. The data still cannot be held to provide evidence for the existence of visual images in fish.—*J. D. London.*

7769. **Kimmel, H. D.** (U. South Florida) **Essential events in the acquisition of classical conditioning.** *Conditional Reflex*, 1970(Jul), Vol. 5(3), 156-164.—Identifies 3 approaches to the definition of "mediating" mechanisms in classical conditioning—that of the neuro-

psychologist, the radical empiricist, and the theoretical behaviorist. Studies are reported concerning inhibitory behavioral aspects of classical conditioning, especially the diminution of the unconditional response and the conditioned inhibition of the conditional response. Theoretical possibilities concerning this inhibitory phenomenon are considered. It is concluded that a possibly essential factor in the acquisition of classical conditioning is the "paired presentation in appropriately close temporal contiguity of the conditional stimulus and the unconditional stimulus, but only when the course of conditional response acquisition is still upward."—P. McMillan.

7770. Kremer, Edwin F. & Kamin, Leon J. (Princeton U.) **The truly random control procedure: Associative or nonassociative effects in rats.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 203-210.—Using 16 naive male hooded rats in a CER paradigm, a truly random (TR) control procedure was found to produce reliable suppression during testing. The suppression could not be attributed to a nonassociative effect based simply on prior experience with both stimuli, independent of temporal spacing, as a group receiving the same number of CSs and UCSs "explicitly unpaired" showed little suppression. In a 2nd experiment with 16 hooded and 16 albino Holtzman rats, unlike at least some nonassociative effects, TR-produced suppression was retained intact over a long retention interval. In Exp. III with 32 naive male hooded rats, the outcome of a TR schedule was shown to be sensitively related to average CS-UCS interval, despite the absence of any contingency.—*Journal abstract*.

7771. Levis, Donald J. (U. Iowa) **Short- and long-term auditory history and stimulus control in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 298-314.—The rearing history of the organism was considered a potentially important variable in determining the ability of offset of a stimulus to serve as a cue for responding. 72 naive male Blue Spruce rats were raised for various durations under a constant-tone environment and/or under normal rearing conditions. At maturity, Ss were exposed to either a tone-present or tone-absent cue. Tone offset provided a comparable cue as its onset, for both rearing conditions, in either a shuttle-box avoidance or bar-press situation. Long-term tone exposure retarded an S's avoidance learning and appeared to reduce responsiveness to fearful stimuli. This effect is not a function of early experience but rather is related to the duration of exposure. (27 ref.)—*Journal abstract*.

7772. Li, Mei-chih. (National Taiwan U., Taipei) **The relationship between classical conditioning and generalization.** *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 135-141.—Administered classical conditioning trials to 14 goats. Of these trials 16 were training trials, with 500-msec light for CS and 150-msec electric shock for UCS; 2 were test trials, with 500 msec-light accompanied with 30-msec electric shock; and 2 were 500-msec light alone for test stimuli. If response potential were considered an index of response strength, a rather distinctive generalization gradient is obtained. The response potential decreases as the difference between training stimulus and the test stimulus increases. Results illustrate the fact that classical conditioning can be regarded as a special case of generalization. CS and UCS in the classical conditioning corresponds to the training stimulus in the

process of generalization, whereas CS plus a fraction of UCS in the classical procedure is equal to the test stimulus of generalization.—*Journal abstract*.

7773. Miyata, Y. & Soltysek, S. (Nencki Inst. of Experimental Biology, Warsaw, Poland) **The relations between salivary, cardiac and motor responses during instrumental performance.** *Acta Biologica Experimentalis*, 1968, Vol. 28(4), 345-361.—Using the Ellison-Konorski separation procedure, 6 naive adult mongrel dogs were trained to perform 14 lever presses in response to a metronome (instrumental CS), followed by a buzzer (classical CS) and food reinforcement. Salivary and instrumental CRs and cardiac responses were recorded. 2 other Ss served as controls. The instrumental CS elicited lever pressing but also a fair rate of salivation, and failed to obtain a strict separation between the motor and salivary responses. The classical CS, however, strongly inhibited the instrumental response and produced a large amount of salivation. The cardiac rate increased during the instrumental CS and slowed during the classical CS. From several tests of the properties of both CSs, it is concluded that neither was a pure instrumental or classical CS. Acute extinction was performed 3 times in each S. No Ss in the 1st extinction, 1 in the 2nd, and 4 in the 3rd could reach the criterion of 3 consecutive trials without lever pressing. Even when the instrumental CR was extinguished, some salivation was still observed and the cardiac rate remained at a relatively high level. The interrelationship between the drive and consummatory CRs is discussed.—*Journal summary*.

7774. Mohay, Heather & Chen, Chia-Shong. (Monash U., Melbourne, Victoria, Australia) **Effects of food deprivation on the performance of a two-turn task in a temporal circular maze.** *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 674-680.—Trained 10 hooded rats to perform a 2-turn task in a temporal circular maze. The effects of levels of food deprivation (2, 26, 50, 74, 98, 122 hr.) on performance were evaluated. It was found that the correct responses were not affected, but both running time and competing behavior decreased significantly with increase in hours of food deprivation. In a 2nd experiment, 8 Ss were trained in a similar way and after attaining a stable performance, were run for a further 4 sessions at 24-hr deprivation, and then at 72-hr deprivation. Results preclude the possibility that results obtained in Exp. I were due to practice effects, and support the findings on the effects of deprivation.—*Journal abstract*.

7775. Ramsay, Douglas A. (Franklin Delano Roosevelt Veterans Administration Hosp., Montrose, N.Y.) **Form and characteristics of the cardiovascular conditional response in Rhesus monkeys.** *Conditional Reflex*, 1970(Jan), Vol. 5(1), 36-51.—Exposed 3 male rhesus monkeys restrained in primate chairs to several Pavlovian control procedures, followed by 13 sessions of cardiac conditioning under a delay paradigm. The CS was a vertical line and the UCS was electric foot shock. Heart rate (HR) was analyzed in successive 5-sec intervals beginning 5 sec. before CS onset. The major finding was that the CR was consistently biphasic and consisted of an initial acceleration followed by deceleration toward the base line, but rarely reaching it before onset of UCS. Ss differed in magnitude of acceleration and subsequent deceleration as well as the location of the maximum rate in the CS-UCS interval. A breakdown of trials on the basis of the pre-CS HR revealed that the

magnitude of effect was inversely related to the pre-CS rate. (24 ref.)—*Journal abstract.*

7776. Rudenko, L. P. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) *K voprosu o mekhanizme uslovno-reflektornogo pereklyucheniya.* [On the mechanism of conditioned response switchover.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 794-800.—Utilized secretory alimentary and instrumental electrodefensive CRs on 4 dogs to determine (a) whether in CR switchover functional readiness is merely an aspect of a "dominant" in operation or whether at its basis an elaborated CR of the "tonic type" is to be found, and (b) what physiological mechanism is involved in the emergence of a phasic CR against a background of functional readiness as well as the significance of the signal character and specificity of the CS in eliciting the corresponding reaction. A number of functional tests were carried out, involving the substitution of different stimuli: (a) participating in the switchover, (b) indifferent, (c) with definite signal significance. Alimentary and defensive CRs were elaborated to the same signal stimuli (bell, buzzer, light). The start of a wall ventilator served as switchover signal in the electrodefensive situation; its cessation for the alimentary situation. It was established that the employment of an indifferent stimulus instead of the switchover signal interfered with the switchover effect. Indifferent stimuli, employed in place of the phasic, did not produce the corresponding reaction. CSs, employed in an opposite situation, elicited a reaction corresponding to their own signal significance, not that corresponding to the situation in which they were employed. It is concluded that, at the basis of functional readiness for imminent activity, there lie not the operations of a "dominant," but those characteristic of CR activity, i.e., the "elaboration of true CRs." A CR, accordingly, is elaborated to a switchover stimulus—a reflex which is not visibly active, but which creates maximal functional readiness for imminent activity. E. A. Asratyan's conception of a "tonic" CR.—*I. D. London.*

7777. Schoenfeld, W. N. (Queens Coll., City U. New York) *Oyepk on mediating mechanisms of the conditional reflex.* *Conditional Reflex*, 1970(Jul), Vol. 5(3), 165-170.—Discusses mediating mechanisms from the "pure" behavioristic viewpoint. A preference for empirical approaches over reliance on hypothetical constructs is presented in considering all events that occur between the stimulus and the response. Examples are provided from studies with a Pavlovian or an operant approach. Conclusions illustrative of the behavioristic viewpoint include the following: (a) "experimental analysis of behavior into reflex terms is not compromised by analysis at any other level"; and (b) data so derived have "absolute priority over all constructional theories about the reflex and its mediating mechanisms."—*P. McMillan.*

7778. Shapiro, Martin M., Mugg, Gregory J., & Ewald, William. (Emory U.) *Instrumental preferences and conditioned preparatory responses in dogs.* *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 227-232.—24 dogs, divided into 3 groups, chose between 2 levers. Forced trials were intermixed with free-choice trials. Both levers produced a 4-sec noise with a probability of .5 and both produced food after the delay with a probability of .5. The levers differed only in the correlation between noise and food,

1, .5, or 0; each group had a choice between 2 contingencies. Ss preferred the lower correlation lever, but salivated more to the noise after pressing the higher correlation lever. Salivary results were attenuated when the data were compared with respect to each S's preference of choice rather than the correlations of the levers. Salivation was functionally related to stimulus contingencies rather than instrumental choice behavior. (15 ref.)—*Journal abstract.*

7779. Shapiro, Martin M., Sadler, Emory W., & Mugg, Gregory J. (Emory U.) *Compound stimulus effects during higher order salivary conditioning in dogs.* *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 222-226.—Ran 45 dogs on higher order salivary conditioning, pseudohigher order, a generalization control, a 1st-order control, or a partial reinforcement procedure. Significant higher order salivary conditioning was demonstrated. The subsequent extinction of the higher order CR was shown to be a function of the discrimination between the higher order serial stimulus and the 1st-order CS.—*Journal abstract.*

7780. Smith, Stanley G. (U. Mississippi, Biocontrol Systems Lab.) *Auto-shaping: A three key technique.* *Psychological Record*, 1970(Sum), Vol. 20(3), 343-345.—Attempted to extend single key autoshaping to 3-key training. 3 naive homing pigeons were given key peck training with a 3-key autoshaping technique. The new procedure eliminates successive approximation shaping and presence of the E. Results indicate all Ss rapidly acquire the initial pecking behavior and readily transfer it to a new discrimination on the 1st trial. It is suggested that the technique would be desirable for the operant laboratory.—*Journal abstract.*

7781. Tang, Maisy & Collier, George. (Rutgers State U.) *Effect of successive deprivations and recoveries on the level of instrumental performance in the rat.* *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 108-114.—Studied the effect of prior deprivation experience and different metabolic states on the relationship between percentage body weight loss and rate of instrumental behavior. A group of 8 male albino Sprague-Dawley rats were trained to bar press for water on a variable interval (VI) 1 schedule and were then subjected to 3 successive water-deprivation recovery cycles. A 2nd group of 8 matched Ss was given only 2 cycles with the 1st cycle beginning at the same time the 1st group initiated its 2nd deprivation. Bar-press sessions were given throughout the duration of the experiment. Results reveal that neither prior deprivation nor different metabolic states (deprivation vs. recovery) had any effect on the function between body weight loss and rate of performance and failed to find any significant difference in either the slopes or intercepts from any of the functions obtained. Results suggest body weight loss regardless of the direction of weight change to be a major factor in determining the level of thirst-motivated behavior, and that this relationship appeared to be independent of prior deprivation experiences. (18 ref.)—*Journal abstract.*

7782. Uhl, Charles N. & Sherman, William O. (U. Utah) *Comparison of combinations of omission, punishment, and extinction methods in response elimination in rats.* *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 59-65.—Compared, after 40 male albino rats were pre-trained to lever press for sucrose reinforcement, the relative effectiveness of combinations of omission,

extinction, and punishment in eliminating the lever-pressing response. Omission is characterized by reinforcement of response cessation. Punishment consisted of grid shock. Response elimination was more rapid when punishment was used in combination with omission or extinction in comparison to either of the latter procedures used alone. However, the durability of response elimination was greater when omission alone was used in comparison with extinction alone or combinations of punishment with omission or extinction. Results amplify and extend previous research demonstrating the efficacy of omission as a response-elimination procedure, especially in terms of the relatively greater durability of omission effects in comparison with other response-elimination methods.—*Journal abstract.*

7783. Vogel-Sprott, M. & Burrows, V. (U. Waterloo, Ontario, Canada) **Response suppression in humans as a function of contingent and non-contingent punishment: Signal properties of stimuli.** *Canadian Journal of Psychology*, 1969(Feb), Vol. 23(1), 66-74.—Trained an instrumental goal (G) response in 40 undergraduates in 4 groups under intermittent reward (money). When the acquisition criterion was met, reward was withdrawn and different punishment treatments administered. Group C received contingent punishment (electric shock) of the G response whenever it was omitted. Shock occurring on a variable interval schedule provided noncontingent punishment to another group (NC). Contingent and noncontingent punishments were combined and administered to Group C and NC. The 4th group (E) served as a control and received no punishment. This entire study was repeated, and both experiments indicate that the C treatment yielded most suppression, even exceeding that obtained under the C and NC procedure which administered more punishments. Results favor the notion that punishment acts in an analogous, but opposite direction to reward, and that its consequences may be predicted on the basis of the consistency of the information conveyed by a punisher. (French summary)—*Journal abstract.*

7784. Weisman, R. G. & Litner, J. S. (Queen's U., Kingston, Ontario, Canada) **Role of the intertrial interval in Pavlovian differential conditioning of fear in rats.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 211-218.—In Exp. I, 36 naive female Long-Evans rats were trained to turn a wheel to avoid unsignaled shock, then received Pavlovian differential conditioning with either a .5-, 1-, 2-, or 5-min ITI. Decreased responding to CS-, but not increased responding to CS+, was a function of ITI duration. In Exp. II with 47 female hooded rats, Pavlovian differential inhibitory conditioning, with 2 conditioned inhibitors (CI₁ and CI₂), each signaling a different shock-free interval, was administered. Decreased responding to CI₁, that always signaled at 200-sec period free from shock, was a function of the duration of the shock-free (10-, 110-, 200-, 290-, or 390-sec) interval correlated with CI₁. Results suggest possible relationships between the role of the intertrial, or shock-free, interval in Pavlovian inhibitory conditioning and in avoidance training. (20 ref.)—*Journal abstract.*

7785. Wu, En-chang. (National Taiwan U., Taipei) **Body weight and the maximum of effort.** *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 142-148.—Using a modified Skinner-box, 24 albino cross-hooded rats were tested concerning the relationship between

body weight and maximum effort. Ss average age was 150 days when the experiment began. Results indicate that 2 kinds of bar-pressing were used by Ss: (a) the usual method of standing on the grid and putting forelegs on the bar; and (b) other methods, e.g., biting the bar or standing or hanging on it. Counting the 2 kinds as 1, there is a coefficient $r = -.014$ for body weight and maximum of effort. However if only the usual method of bar pressing is considered, which includes 83.33% of Ss, another $r = .87$ with $Z = 3.83$ is gained. It is concluded that body weight, in general, correlates with maximum effort.—*Journal abstract.*

Discrimination

7786. Born, David G. & Snow, Mark E. (U. Utah) **Stimulus control by relevant, irrelevant, and redundant components of complex stimuli as assessed by two testing methods.** *Psychological Record*, 1970(Sum), Vol. 20(3), 311-319.—Compared generalization and component stimulus testing procedures within each of 6 adult white King pigeons. Ss learned a successive discrimination where S+ was a vertical line on a green background, and S- was either a green background, a red background, or a vertical line on a red background. Generalization of responding to the angular orientation of line on green, dark, and red backgrounds was evaluated. A component stimulus test was conducted in which green, line on green, red, line on red, dark, and line on dark, appeared separately. Steep generalization gradients were obtained from all Ss when angular orientation was varied on the green background, and similar gradients were obtained from all but 1 S when the background was dark. Results indicate stimulus control by line for Ss in all groups. However, results of the component stimulus test indicate clear stimulus control by line only in the case of the 2 Ss trained with a green background, and 1 of the Ss with a red background. Component stimulus tests for the other 3 Ss produced no clear evidence of stimulus control by line. Of the 2 testing methods used to determine stimulus control, stimulus generalization testing appears to be the most sensitive and easiest to interpret.—*Journal abstract.*

7787. Miles, C. G., Mackintosh, N. J., & Westbrook, R. F. (Addiction Research Foundation, Toronto, Ontario, Canada) **Redistributing control between the elements of a compound stimulus.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 478-483.—Gave 28 hybrid male pigeons discrimination training. 4 groups were run in which for 0, 2, 4, and 9 sessions of training color was an irrelevant cue and tone was relevant. Generalization tests were given in extinction; the training color (C₁) and another color (C₂) were presented with tone (T) and noise (N). Responding to these 4 stimulus combinations, TC₁, TC₂, NC₁, and NC₂, allowed the assessment of control by color and tone. A reduction of control by color and an increase in control by tone were found to be positively related to the amount of training with color irrelevant. Tests show a strong inverse relationship between control by color and tone.—*Journal abstract.*

7788. Milner, A. D. (Inst. of Psychiatry, London, England) **Cross-modal transfer between touch and vision without change of illumination.** *Neuropsychologia*, 1970(Nov), Vol. 8(4), 501-503.—11 preadolescent rhesus monkeys showed significant transfer of training from a visual shape discrimination given in darkness

(using self-luminous objects) to the same discrimination given in the light. No transfer was found between a visual and tactual size discrimination both of which were given in darkness. Results suggest that the illumination change normally a feature of tactual/visual cross-modal transfer studies is not critical. (French & German summaries)—*Journal abstract*.

7789. Riopelle, A. J. & Kumaran, Mary B. (Tulane U., Delta Regional Primate Research Center, Covington, La.) **Learning of repeated and nonrepeated discrimination-reversal problems by patas monkeys.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 185-191.—Trained 40 patas monkeys on 10 repeated-reversal problems with 5 reversals/problem using correction and noncorrection procedure. Criterion lengths prior to reversal were 2, 3, 4, 8, and 16 consecutive correct responses. Ss were then tested on nonrepeated reversals. The most important determiner of proficiency was criterion length. Proficiency on Exp. I did not predict efficiency in Exp. II. The role of win-stay, lose-shift hypotheses is questioned as is the general capability of the patas monkey in discrimination-learning performance. (26 ref.)—*Journal abstract*.

7790. Steiner, John. (Maudsley Hosp., Inst. of Psychiatry, London, England) **Observing responses and uncertainty reduction: II. The effect of varying the probability of reinforcement.** *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 592-599.—Used the observing response paradigm to assess the reinforcing properties of discriminative stimuli by allowing a rhesus monkey and a baboon either to work for food in the presence of a neutral stimulus or to 1st make an observing response by pressing a lever. On a progressive ratio schedule this resulted in the appearance of easily discriminable stimuli which marked positive and negative trials. The uncertainty associated with the imposed neutral stimulus was varied by manipulating the proportion of positive and negative trials in the session. Ss switched most often when the probability of reinforcement was low, less often when it was intermediate, and least often when it was high. This is inconsistent with an uncertainty reduction hypothesis but can be explained if the uncertainty has to do with response rather than outcome.—*Journal abstract*.

7791. Thomas, David R., Miller, James T., & Svinicki, John G. (U. Colorado) **Nonspecific transfer effects of discrimination training in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 96-101.—Gave 1 group of 11 male albino Sprague-Dawley rats 16 sessions of "true-discrimination" (TD) training in which the houselight intensity, bright or dim, denoted S+ and S-. 1 control group of 11 Ss was given training in which responses to the 2 intensities were equally reinforced, while another control group of 11 Ss experienced only 1 light intensity. Next, all Ss were shifted to a transfer problem in which tones of 2500 and 4500 Hz. denoted S+ and S-. An analysis of the percentage of total responses to S+ revealed that the TD group learned more rapidly than either of the controls, which did not differ. Thus, the nonspecific transfer effect previously observed with pigeons extends to a different species and to discrimination problems in different sensory modalities.—*Journal abstract*.

Avoidance & Escape

7792. Banks, R. K. & Torney, D. (U. Waterloo,

Ontario, Canada) **Generalization of persistence: The transfer of approach behaviour to differing aversive stimuli.** *Canadian Journal of Psychology*, 1969(Aug), Vol. 23(4), 268-273.—In 3 experiments it was found that intermittent punishment with electric shock increased persistence to quantitatively and qualitatively different punishers but failed to increase resistance to extinction. Male albino Wistar rats (N=16, 26, and 17, respectively) served as Ss. It is suggested that while approach tendencies acquired to 1 fear state may be elicited by quite different fear states, generalization between fear and frustration may be limited by fairly narrow boundary conditions. (French summary)—*Journal abstract*.

7793. Fonberg, Elzbieta. (Nencki Inst. of Experimental Biology, Warsaw, Poland) **The instrumental alimentary-avoidance differentiation in dogs.** *Acta Biologicae Experimentalis*, 1968, Vol. 28(4), 363-373.—Established an alimentary-avoidance differentiation in 12 male mongrel dogs in 2 experiments. Results indicate that (a) combining alimentary and avoidance procedures during the same experimental session is not neurosogenic, and (b) the alimentary-avoidance differentiation was not more difficult for Ss than the usual alimentary differentiation between positive and inhibitory stimuli. (22 ref.)—*Journal summary*.

7794. Riccio, David C. & Schulenburg, Candace J. (Kent State U.) **Age-related deficits in acquisition of a passive avoidance response.** *Canadian Journal of Psychology*, 1969(Dec), Vol. 23(6), 429-437.—In Exp. I, 80 male albino rats 10, 15, 20, 30, or 100 days old received a brief inescapable shock contingent upon making a step-off response. Step-off latencies increased for all age groups, but rate of learning was significantly faster in older Ss. Learning appeared to be based primarily upon punishment effects rather than general emotionality, since yoked Ss shocked after being placed directly on the grids did not acquire the avoidance response. Exp. II with 120 Ss employed 3 training conditions with independent groups 12, 15, 18, or 21 days old. The step-off response resulted in shock that was either: (a) escapable; (b) inescapable, 1-sec duration; or (c) inescapable, yoked duration. Younger Ss were again significantly inferior to more mature Ss. Escapable shock improved acquisition at 2 age levels, but the effect appeared to be more related to shock duration than to the response contingency. It is suggested that the requirement of withholding a punished response may represent a category of learning that is especially sensitive to maturational changes. (French summary) (16 ref.)—*Journal abstract*.

7795. Schulenburg, Candace J., Riccio, David C., & Stikes, Edna R. (Kent State U.) **Acquisition and retention of a passive-avoidance response as a function of age in rats.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 75-83.—Administered in Exp. I, brief inescapable shock to 135 15-, 21-, 27-, and 100-day old male albino Holtzman rats contingent upon crossing into the black side of a white-black chamber. Rate of acquisition increased significantly as a function of age. Resistance to extinction suggested that immature animals were also somewhat inferior to adults in response strength. Exp. II and III examined the influence of age, shock duration in training, and length of the training-test interval upon retention of the passive-avoidance response. Young Ss were markedly inferior to adults in retention, even under training conditions which produced comparable re-

sponse strength across ages. (23 ref.)—*Journal abstract.*

7796. Steiner, Geri. (RPH-1, Massachusetts General Hosp., Boston) **Stimulus control of avoidance learning in fish.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 52-58.—Observed shuttling in 72 common goldfish in the absence of shock schedule, in 2 experiments with nonavoidable shock and with avoidable shock. After establishing that this response was an operant, the development of stimulus control over shuttling was compared under free-operant and traditional discriminated-avoidance schedules by investigating the effects of variables on which these schedules differ. Introducing temporal restrictions on avoidance (differential reinforcement) into free-operant schedules lowered avoidance significantly, while the introduction of signals prior to shock increased avoidance. Response distributions revealed that diverse patterns of stimulus control were generated. Although schedules, in general, produced characteristic response patterns, individual deviations provided important clues to mechanisms underlying avoidance learning.—*Journal abstract.*

Reinforcement

7797. Biederman, Gerald B. & Furedy, John J. (U. Toronto, Ontario, Canada) **The preference-for-signalled-shock phenomenon: Signalling shock is reinforcing only if shock is modifiable.** *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 681-685.—Inescapable, unavoidable, 5-sec shocks were preceded by 5-sec white-noise signals contingent on previously food-trained bar pressing and fixed ratio 40 reinforcement training of 20 male Sprague-Dawley rats. 20 yoked-control Ss receiving the same, but noncontingent, series of signals indicated that the signal was reliably reinforcing only if the shocks were delivered through an alternate, rather than scrambled, floor-grid system. Implications are discussed for previous reports of the preference for signaled shock phenomenon.—*Journal abstract.*

7798. James, J. P. & Mostoway, Walter W. (U. Manitoba, Winnipeg, Canada) **Stimulus intensity dynamism: Effect of non-reinforcement of the highest intensity stimulus.** *Canadian Journal of Psychology*, 1969(Feb), Vol. 23(1), 49-55.—24 naive male albino Sprague-Dawley rats, in 2 groups, received extensive lever-pressing-discrimination training to 4 intensities of auditory stimulation (85, 90, 95, 100 db.); 1 intensity was SA and 3 were SP. For 1 group, the lowest intensity stimulus was nonreinforced; for the other group the highest intensity stimulus was the SA. After 24 days, nonreinforcement in each group was switched to stimulation of the other extreme and performance was assessed for an additional 15 days. Results indicate that (a) during the 1st phase response strength was a positive function of the distance, along the intensity continuum, from the nonreinforced stimulus; (b) after nonreinforcement contingencies were changed, performance was immediately disrupted and tended to be replaced by the functional relation of the initial phase; and (c) SA response rate was positively related to SA intensity. (French summary)—*Journal abstract.*

7799. Laforge, Hubert. (U. Quebec, Montreal, Canada) **The influence of random reinforcement on heart rate during extinction.** *Journal of Psychology*, 1971(Jan), Vol. 77(1), 89-99.—Studied heart rate, considered as an

index of specific activation, during extinction in 2 groups of 8 male rats water-deprived for 24 hr. Ss had acquired a habit under either a fixed 100% reinforcement schedule or a random schedule of 50% reinforcement. The significant stimulus was the appearance of a retractible lever and lever pressing by the S resulting in the delivery of water as reinforcement. The attempt to reconcile the theoretical viewpoint of habit activation according to M. H. Marx and the physiological concept of activation was successful. Activation may be considered responsible for the prolonging of the habit as demonstrated by the group which learned under a random reinforcement schedule. (33 ref.)—*Author abstract.*

7800. Marx, Melvin H. & Tombaugh, Tom N. (U. Missouri) **Acquisition and extinction of an instrumental response as a function of quality and quantity of reinforcement.** *Psychological Record*, 1970(Sum), Vol. 20(3), 297-303.—Investigated the "quantitative (volume) and qualitative (concentration) effects of sucrose incentives within a discrete-trial operant paradigm." Ss were 63 albino Sprague-Dawley rats trained in controlled-operant bar-pressing boxes. The design was a 3×3 factorial in which 3 levels of sucrose concentration (4, 16, and 64%) were combined with 3 levels of volume (.05, .15, and .45 ml.). The major findings are: (a) acquisition performance is an increasing monotonic function of both volume and concentration; (b) volume and concentration interact with the effects of volume being greatest at low level of concentration; and (c) in extinction only concentration affects performance, with the 4% groups showing poorer performance in early trials. (23 ref.)—*Journal abstract.*

7801. Tarpay, Roger M. (Williams Coll.) **Reinforcement difference limen (RDL) for effort.** *Canadian Journal of Psychology*, 1969(Dec), Vol. 23(6), 410-414.—150 naive, male albino Sprague-Dawley rats pressed 1 of 2 levers to terminate shock. 1 lever required a standard force, the other a comparison force. Comparison levels were paired with standard force requirements of 20, 40, 80, or 160 g. The reinforcement DL (defined as the minimum difference in force producing a 75% preference for the less effortful lever) increased as a function of the standard force. The relative function, $\Delta E/E$, was U shaped. (French summary)—*Journal abstract.*

Reinforcement Schedule

7802. Carlson, John G. & Arokbaar, Richard E. (U. Hawaii) **Effects of time-out upon concurrent operant responding.** *Psychological Record*, 1970(Sum), Vol. 20(3), 365-371.—Reinforced 2 male Long-Evans hooded rats on variable-interval (VI) schedules of reinforcement on each of 2 concurrently available response levers. When responding on 1 lever was punished by time-out from positive reinforcement (retraction of both levers), responding on the punished lever was suppressed and rate of responding on the unpunished lever increased. The preference for the unpunished lever persisted when the VI schedule of reinforcement on this lever was adjusted to relatively lower levels than that on the punished lever. Results favor the view that time-out functioned as an aversive stimulus in this context.—*Journal abstract.*

7803. Hake, D. F. & Powell, J. (Anna State Hosp., Behavior Research Lab., Ill.) **Positive reinforcement and suppression from the same occurrence of the**

unconditioned stimulus in a positive conditioned suppression procedure. *Journal of the Experimental Analysis of Behavior*, 1970(Nov), Vol. 14(3, Pt. 1), 247-257.—Maintained the responding of 6 experimentally naive Sherman Sprague-Dawley rats on a variable-interval schedule of food reinforcement. The same response also produced a blinking light followed by electrical brain stimulation according to a fixed-interval schedule. This conjoint schedule produced 2 behavioral changes: (a) instead of a steady rate of responding throughout the session, which would be characteristic of the variable-interval food schedule alone, responding between occurrences of the light-brain stimulation pairings became positively accelerated and thus was more characteristic of the fixed-interval schedule of these pairings; and (b) food responding was suppressed during the light that preceded brain stimulation. Results indicate that positive reinforcement and suppression resulted from the same occurrence of the light-brain stimulation combination and suggest that stimuli, e.g., conditioned reinforcers that precede an unconditioned reinforcer may have a suppressive effect upon responding in their presence that is being maintained by another reinforcer. (28 ref.)—*Journal abstract*.

7804. Menitskii, D. N. & Khananashvili, M. M. (Pavlov Inst. of Experimental Medicine, Leningrad, USSR) *Izmeneniya komponentov émoțional'nykh reaktsii u sobak pri veroyatnostnom podkreplenii uslovnykh razdrzhitel'ei i ugashenii uslovnykh reflektsov*. [Changes in the components of emotional reactions in dogs subjected to probability-scheduled reinforcement of conditioned stimuli and extinction of conditioned responses.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(5), 876-878.—Presents the results of 12 experimental series with 6 dogs. The changes in the complex of behavioral reactions of Ss as a function of various probabilities of reinforcement of motor alimentary CRs was investigated. Findings involve (a) the high activity of food procuring reactions under the conditions of probability scheduled reinforcement employed in the study, (b) the slow extinction of the CRs, and (c) the absence of clearly expressed signs of any neurotic state.—I. D. London.

7805. Morgan, M. J. (U. Cambridge, England) **Fixed interval schedules and delay of reinforcement.** *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 663-673.—Compared the behavior of 3 female hooded rats on a fixed interval schedule with their behavior on a schedule where a response made at any time during the interval was reinforced by setting up a reward which was delivered when the interval had elapsed. Response rates were higher in the ordinary fixed interval schedule than in its modified version, and it is argued that this rules out attempts to explain the maintenance of fixed interval performance by delayed reinforcement. Despite the clear difference in response rates, there was considerable similarity between the postreinforcement pauses developed in the 2 schedules, and this suggests that pausing is influenced more by temporal than by response contingencies. (19 ref.)—*Journal abstract*.

7806. Zeiler, Michael D. (Emory U.) **Fixed-interval stimulus control.** *Journal of the Experimental Analysis of Behavior*, 1970(Nov), Vol. 14(3, Pt. 1), 291-299.—Exposed 4 adult white Carneaux pigeons to 3 stimuli simultaneously, with responses to 1 of them, the positive stimulus, followed by food presented according to a

fixed-interval (FI) schedule (2, 4, 8, or 16 min.). Over 90% of the total responses emitted were to the positive stimulus within a few sessions. When Ss were then studied under each of 4 FIs, responding continued to be confined primarily to the same stimulus independent of interval size. In subsequent conditions, the 3 stimuli changed positions after each $\frac{1}{4}$ of the interval. If the position changes did not require a response, response rate and the percentage of responses occurring to the positive stimulus decreased. If the changes did depend on a response, the complete interval appeared to be divided into 4 smaller intervals with a pause and then positively accelerated responding following each position change. Position changes produced by a response to any stimulus decreased control by the positive stimulus, and changes produced only by a response to it increased the percentage of responses made to that stimulus. All of the data suggest that the stimulus conditions contiguous with reinforcement controlled behavior.—*Journal abstract*.

Punishment & Extinction

7807. Baum, Morrie. (McGill U., Montreal, Quebec, Canada) **Extinction of an avoidance response following response prevention: Some parametric investigations.** *Canadian Journal of Psychology*, 1969(Feb), Vol. 23(1), 1-10.—Conducted 2 experiments to investigate parameters influencing the efficacy of response prevention. In Exp. I, with 44 female hooded rats, the amount of response prevention given to Ss who had learned to avoid electric shock in an automated apparatus was systematically varied. Increasing the duration of response prevention increased its effectiveness in hastening extinction. In Exp. II, with 31 Ss, the intensity of shock used in avoidance learning was parametrically varied. More intense shock diminished the efficacy of a fixed amount of response prevention. In both experiments, S's spontaneous behavior during response prevention was systematically recorded. The cessation of fear behavior and the occurrence of relaxation during response prevention were found to predict accurately the successful extinction of the avoidance response. (French summary)—*Journal abstract*.

7808. Best, John K. & Baum, Morrie. (U. Western Ontario, London, Canada) **Studies of the extinction of avoidance responding through the massing of trials.** *Canadian Journal of Psychology*, 1969(Dec), Vol. 23(6), 438-444.—Performed 2 experiments in an automated 1-way avoidance box for rats. Exp. I, with 44 Sprague-Dawley female albino rats, was concerned with the effect of shock intensity on the rate of extinction using the massing-of-trials technique during extinction. Most measures of avoidance learning were not affected by shock intensity, and the rate of extinction was also not significantly affected. Exp. II, with 44 Ss similar to those in Exp. I, examined the effect of the duration of the extinction ITI on the rate of extinction. A critical duration is suggested by results. (French summary) (15 ref.)—*Journal abstract*.

7809. Homzie, M. J., Gohmann, Timothy, & Hall, Stanley W. (U. Virginia) **Runway performance in rats as determined by the predictive value of intertrial reinforcements.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 90-95.—Attempted to investigate the hypothesis that rats discriminate intertrial reinforcements (ITRs) from runway

trials and that such differentiation can affect resistance to extinction. Ss were 45 naive female Long-Evans rats. Ss receiving partial reinforcement training were administered ITRs either positively, negatively, or randomly correlated with reinforced runway trials. Extinction was conducted under 2 different conditions, either the ITR was administered prior to each of the daily nonreinforced trials or the ITR was omitted. For each S the extinction procedure was subsequently switched to the other condition, and later changed back to the original testing method. Results show that with extended training rats differentiated between ITR events and runway trials and that extinction performance was in accordance with the reinforcement contingencies established during acquisition training.—*Journal abstract*.

7810. Katzev, Richard D. & Hendersen, Robert W. (Reed Coll.) **Effects of exteroceptive feedback stimuli on extinguishing avoidance responses in Fischer₃₄₄ rats.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 66-74.—Investigated the role of exteroceptive feedback stimuli in controlling discriminative-avoidance responding during extinction trials in the shuttle box in 3 studies. Ss were 30 experimentally naive male Fischer₃₄₄ rats. Exp. I demonstrated that such a stimulus has no effect on extinction responding when it had been a redundant source of information during previous acquisition trials. In contrast, Exp. II showed that when such a feedback stimulus becomes a source of information during acquisition, its removal during extinction significantly reduces the occurrence of avoidance responses. Exp. III revealed that the probability of responding during extinction trials is a decreasing monotonic function of the delay in presenting such an informational feedback stimulus.—*Journal abstract*.

7811. Leonard, Dale W. & Capaldi, E. J. (U. Rochester) **Successive acquisitions and extinctions in the rat as a function of number of nonrewards in each extinction session.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 102-107.—Gave 2 groups of 11 female albino Holtzman rats a daily acquisition-extinction-reacquisition session for 20 consecutive days in a discrete-trials lever-press situation. In both groups the preextinction acquisition series in each session consisted of 7 rewarded trials while the postextinction acquisition series consisted of 9 rewarded trials. In 1 group (Group 12) the extinction series was 12 consecutive nonrewarded trials; in the other (Group 24) the extinction series was 24 trials. Group 12 exhibited more improvement in acquisition performance across sessions than did Group 24. In extinction Group 12 showed a decrease in extinction rate over sessions, both for the early and late nonrewarded trials in each extinction series. Group 24 showed a decrease in extinction rate over sessions only on late nonrewarded trials in the extinction series, i.e., those immediately preceding reacquisition, but an increase in extinction rate on early extinction trials. A theoretical analysis derived from the sequential hypothesis described these results quite satisfactorily.—*Journal abstract*.

7812. McCain, Garvin; Baerwaldt, James, & Brown, Erin R. (U. Texas, Arlington) **Extinction following a small number of goal-box placements.** *Canadian Journal of Psychology*, 1969(Aug), Vol. 23(4), 274-284.—3 experiments involved extinction of male and female Wistar albino rats in a straight alley following direct

placement in the goal box. Placements were given either before or after running trials in Exp. I and II. In Exp. III only placements with no alley running were given. In each case the presence of a partial reinforcement extinction effect indicates the effectiveness of placements. Data are interpreted in terms of the cue effects of placement. (French summary) (16 ref.)—*Journal abstract*.

7813. Milstead, James R. (U. Houston) **Interactive effects of reward magnitude and intertrial intervals on resistance to extinction.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1567.

7814. Ward, John E. & Duerfeldt, Pryse H. (U. Portland) **The influence of varied reinforcement magnitude on extinction: A test of Capaldi's "N-length" hypothesis.** *Canadian Journal of Psychology*, 1969(Oct), Vol. 23(5), 315-326.—Tested an extension of E. J. Capaldi's modified after effects hypothesis. 3 small reinforcement (s)-length groups of 15 male albino Holtzman rats each were run down a straight alley for a food reward. In place of the usual sequences of nonreward vs. reward trials there were substituted 3 s-length sequences of small- vs. large-reward trials. The s-length is defined by the number of consecutive small-reward trials occurring in sequence without interruption by a large-reward trial. Differential effects of s-length on resistance to extinction were predicted in accordance with Capaldi's theoretical development of the hypothesis. Analyses of extinction data statistically confirm, in general, the experimental predictions and support the nonreinforcement-length hypothesis. (French summary)—*Journal abstract*.

SOCIAL & SEXUAL BEHAVIOR

7815. Barrass, Robert. (Sunderland Polytechnic, England) **Preening and abdomen dipping by the male *Mormoniella vitripennis* (Walker) (Hymenoptera, Pteromalidae) after courtship.** *Behaviour*, 1969, Vol. 35(3-4), 304-312.—Observed wasps that had been parasitic on house fly pupae on their 1st day as imagos. "Fewer preening movements occur when a male is undisturbed than after courtship and more after courtship of 20 females than after a single courtship. Abdomen dipping movement may occur when the male is undisturbed but they occur characteristically after courtship. More abdomen dipping movements follow mating than follow courtship of non-receptive females. These movements are compared to the 'displacement activities' described in other groups of animals."—N. M. Ginsburg.

7816. Bierl, Barbara A., Beroza, Morton, & Collier, C. W. (U.S. Agricultural Research Service, Entomology Research Div., Beltsville, Md.) **Potent sex attractant of the gypsy moth: Its isolation, identification, and synthesis.** *Science*, 1970(Oct), Vol. 170(3953), 87-89.—Identified the sex attractant emitted by the female gypsy moth (*Porthetria dispar*) as cis-7,8-epoxy-2-methyloctadecane. The structure was verified by spectral, gas chromatographic, and biological comparisons with the synthesized compound. 9 closely related isomers were considered less effective. (20 ref.)—*Journal abstract*.

7817. Cole, James E. & Ward, Jack A. (Bloomsburg State Coll.) **The communicative function of pelvic fin-flickering in *Etoplus maculatus* (Pisces, Cichlidae).** *Behaviour*, 1969, Vol. 35(3-4), 179-199.—"Fin-flickering... is exhibited only by adult fish when they are caring for young." Orange chromides were

observed during Days 1, 3, 6, 9, and 12 of free swimming of the fry. Ss were observed when undisturbed and when disturbed by a ball swung in front of the tank. "The amount of parental fin-flickering during undisturbed conditions was significantly greater on Day 3 than on any other test day." On all test days fin-flickering was much higher when Ss were disturbed. There were no sex differences under either condition.—*N. M. Ginsburg.*

7818. Free, J. B., Weinberg, Ingrid, & Whiten, A. (Rothamsted Experimental Station, Harpenden, England) **The egg-eating behavior of *Bombus lapidarius* L.** *Behaviour*, 1969, Vol. 35(3-4), 313-317.—Established and observed a bumblebee colony in a nest box. Ovaries of marked workers were later dissected, and oocytes counted. "When ... workers built egg cells and laid eggs, their queen ate the eggs and appropriated the egg cells for her own eggs, whereupon the workers tried to eat her eggs. There was a positive general correlation between the tendency of workers to behave aggressively, to demolish and build cells, to lay and eat eggs, and the degree of their ovary development."—*N. M. Ginsburg.*

7820. Lockner, F. Russell & Phillips, Richard E. (Sonoma State Coll.) **A preliminary analysis of the decrescendo call in female mallards (*Anas platyrhynchos* L.)** *Behaviour*, 1969, Vol. 35(3-4), 281-287.—"Conditions necessary for the elicitation of this call were studied in captive, paired female Mallards ... in both outdoor and indoor pens. Paired females gave significantly more calls when visually isolated from their mates than when their mates were present. The response was specific to separation from the mates and not to separation from familiar but non-mated males. Females did not give decrescendos when they were auditorially as well as visually isolated from their mates."—*N. M. Ginsburg.*

7821. Menzel, Emil W. (Tulane U., Delta Regional Primate Research Center, Covington, La.) **Group behavior in young chimpanzees: Responsiveness to cumulative novel changes in a large outdoor enclosure.** *Journal of Comparative & Physiological Psychology*, 1971(Jan), Vol. 74(1, Pt. 1), 46-51.—An established social unit of 4 juvenile chimpanzees was acute in detecting successive additions of 1 new object at a time to an array of 20 test objects in a 30.5 × 122 m. field. The nature and temporal course of responsiveness conformed generally to previous descriptions of individual habituation to novelty in more traditional laboratory settings. However, group processes and spatial variables introduced new problems of equal or greater importance. (16 ref.)—*Journal abstract.*

7822. Pearce, C. (U. Adelaide, South Australia) **A new deterministic model for the interaction between predator and prey.** *Biometrics*, 1970(Sep), Vol. 26(3), 387-392.—A simple model, differing from the standard Lotka-Volterra model in the assumptions made, is proposed to describe the interaction between predator and prey. The difficulties of that model are overcome without the introduction of such additional factors as immigration.—*Journal summary.*

SENSORY PROCESSES

7823. Bertmar, Gunnar & Toft, Rolf. (U. Umea,

Sweden) **Sensory mechanisms of homing in salmonid fish: I. Introductory experiments on the olfactory sense in grilse of Baltic salmon (*Salmo salar*).** *Behaviour*, 1969, Vol. 35(3-4), 235-241.—Eliminated the olfactory sense in 191 grilse and then released them 35-40 km north and south of the home river. "Most of these fishes failed to orient toward home during spawning time, whereas many of the 100 control animals traumatized on the nose homed as readily as did many of the 100 untreated controls released in the same place. These results indicate an important role for olfaction in homing behaviour and migration."—*N. M. Ginsburg.*

7824. Fay, Richard R. (Princeton U., Auditory Research Lab.) **Auditory frequency generalization in the goldfish (*Carassius auratus*).** *Journal of the Experimental Analysis of Behavior*, 1970(Nov), Vol. 14(3, Pt. 1), 353-360.—Studied auditory frequency generalization in 20 goldfish at 5 points within the best hearing range through the use of classical respiratory conditioning. Each experimental group received single-stimulus conditioning sessions at 1 of 5 stimulus frequencies (100, 200, 400, 800, and 1600 Hz.), and were subsequently tested for generalization at 8 neighboring frequencies. All stimuli were presented 30 db. above absolute threshold. Significant generalization decrements were found for all Ss. For the Ss conditioned in the range between 100-800 Hz., a nearly complete failure to generalize was found at 1 octave above and below training frequency. The Ss conditioned at 1600 Hz. produced relatively more flat gradients between 900-12000 Hz. The widths of the generalization gradients, expressed in Hz., increased as a power function of frequency with a slope greater than 1. (23 ref.)—*Journal abstract.*

7825. Graham, Ernest S., Farrer, Donald N., Crook, Guy H., & Garcia, Paul V. (Holloman Air Force Base, 6571st Aeromedical Research Lab., Alamogordo, N. M.) **A self-adjustment procedure for measuring the visual acuity of rhesus monkeys.** *Behavior Research Methods & Instrumentation*, 1970(Nov), Vol. 2(6), 301-305.—Describes a visual acuity testing procedure which uses a self-adjustment procedure combined with shock avoidance and punishment. A male rhesus monkey (*Macaca mulatta*) served as the S. S adjusts the size of the gap opening in Landolt rings by pressing levers. Correct trials decrease the size of the gap opening and are followed by a tone; incorrect trials increase the size of the gap opening and are followed by shock. The number of correct and incorrect trials needed to change the gap-opening size can be varied.—*Journal abstract.*

7826. Hack, Martin H. (New York U., Medical School) **Auditory intensity discrimination in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Feb), Vol. 74(2), 315-318.—Examined auditory intensity discrimination in 5 naive male albino Wistar rats in a frequency range of 2-30 kHz., at sensation levels of 20 and 40 db. Minimum mean DLs at these 2 sensation levels were found to be 2.3 and 1.3 db., respectively, at 8 kHz. These values were compared with those of man, cat, and goldfish. They were found to be of the same magnitude, except for relative shifts along the frequency axis.—*Journal abstract.*

7827. Hoffman, Howard S. & Wible, Barry L. (Pennsylvania State U.) **Role of weak signals in acoustic startle.** *Journal of the Acoustical Society of America*, 1970(Feb), Vol. 47(2, Pt. 2), 489-497.—Conducted 2 experiments to determine the minimum inten-

sity at which a weak signal could reliably produce facilitation (latency reduction) and inhibition (amplitude reduction) of the startle response in 7 and 6 experimentally naive male Wistar rats. Stimulus configurations were used in which the weak pulse had intensities as low as 10 db. Both response inhibition and latency reduction were detected when the weak signal had an intensity of only 35 db., and the magnitude of the 2 effects increased with increases in pulse intensity. Since, for signals comparable to the pulses used here, the S's threshold for hearing is approximately 35 db., it is concluded that the brain system that mediates these effects is probably as sensitive as the auditory system itself. (16 ref.)—*Journal abstract*.

7828. Morrison, G. Rolfe. (McMaster U., Hamilton, Ontario, Canada) **The relative effectiveness of salt stimuli for the rat.** *Canadian Journal of Psychology*, 1969(Feb), Vol. 23(1), 34-40.—Determined the relative detectability of 8 salts over a molar concentration range of .0125-.80 in an experiment with 5 male hooded rats. The detectability of those salts, which have a strong sour or bitter quality, is substantially greater when compared with sodium chloride, than their relative effectiveness as determined by the size of the evoked response in the chorda tympani. It is suggested that, like quinine, these salts are more effective on the posterior tongue. (French summary)—*Journal abstract*.

DEVELOPMENTAL PSYCHOLOGY

7829. Bühler, Charlotte. (U. Southern California, Medical School) **Vorstellungen vom Glück in unterschiedlichen Altersgruppen.** [The concept of happiness in different age groups.] *Psychologische Beiträge*, 1970, Vol. 12(2), 173-185.—Reviewed and summarized results of investigations conducted since 1965 concerning the concept of "happiness" in different age groups. Elementary school children (age 8) responded to interviews in such a manner as to equate happiness with wish fulfillment. An investigation in 1967 by E. Scott of delinquent and nondelinquent Oregon high school students showed that happiness was most often equated by both groups with feelings of love, success, and personal satisfaction. Another study by S. Blum revealed that middle-aged women, equated happiness with marital accord. In conclusion, it is suggested that personal interviews and psychotherapy records were of greater value than were questionnaires in conducting investigations of the concept of "happiness." (French & English summaries) (15 ref.)—*B. A. Stanton*.

7830. Kay, A. W. (Nottingham Coll. of Education, England) **Moral development: A psychological study of moral growth from childhood to adolescence.** New York, N.Y.: Schocken, 1969, 270 p. \$5.50.

7831. Liss, Phillip H. & Haith, Marshall M. (City Coll., City U. New York) **The speed of visual processing in children and adults: Effects of backward and forward masking.** *Perception & Psychophysics*, 1970(Dec), Vol. 8(6), 396-398.—Tested 8 4-5 and 9-10 yr. old children, and college-age adults on 2 visual masking tasks. In Task 1, Ss indicated whether a tachistoscopically presented bar was horizontal or vertical. In Task 2, also using tachistoscopic presentation of stimuli, Ss located a horizontal (or vertical) bar in a matrix of vertical (or horizontal) bars. In both tasks, backward masking produced greater disruption than

forward masking, and the amount of disruption induced by both decreased as age increased. An Age \times Masking Condition interaction was found only in the location task and reflected a much greater difference between backward- and forward-masking conditions for the youngest group than for older groups. It is concluded that only in the location task, which presumably required visual search, was the speed of visual processing slower in the younger group.—*Journal abstract*.

7832. Mackworth, N. H. & Bruner, J. S. (Stanford U.) **How adults and children search and recognize pictures.** *Human Development*, 1970, Vol. 13(3), 149-177.—Recorded the eye fixations of 20 young adults and 20 6-yr-old children while they were recognizing or inspecting a series of displays. The test photographs presented 3 levels of definition for 1 particular scene: very blurred, blurred, or sharp. Each picture was presented for 2 10-sec trials. Either the very blurred or the sharp picture was given 1st to a particular S. The position and sequence of the fixations of each S were recorded individually on a Polaroid copy or the original display. 8 different analysis procedures were used to study the eye tracks, and all showed reliable differences between adults and children. With the sharp pictures, children lacked adequate coverage of the display; and their eye tracks averaged only $\frac{2}{3}$ the length of the adult tracks. Adults were more skillful at visually selecting the informative areas within out-of-focus pictures which requires a delicate balance between central and peripheral vision. Children were less consistent than adults regarding the areas they visually selected from the out-of-focus displays. Only adults attempted to relate important areas of such displays by long leaping movements of the eyes. The direction of these long movements altered when S already knew the nature of the display. Adult fixation times increased by 40% when Ss had to comprehend the out-of-focus displays rather than merely inspect them. Theoretical interpretations are provided. (73 ref.)—*Journal abstract*.

7833. Piaget, Jean. **Izbrannyye psikhologicheskile trudy.** [Collected psychological words.] Moscow, USSR: Prosveshchenie, 1969, 660 p.—Presents translations of several of Piaget's works: *La Psychologie de l'Intelligence*, *La Genèse du Nombre Chez l'Enfant*, and *Logic and Psychology*. The translations include (a) an introductory article on the operational conception of the intellect in the works of Piaget, coauthored by V. A. Lektorskiĭ, V. N. Sadovskii, and E. G. Yudin; (b) a concluding commentary by the same authors; (c) a listing of terminological vocabulary (French-Russian); and (d) a complete bibliography of Piaget's writings, including translations into foreign languages.—*I. D. London*.

7834. Schmidt, W. H. & Nzimande, A. (U. Alberta, Edmonton, Canada) **Cultural differences in color/form preference and in classificatory behavior.** *Human Development*, 1970, Vol. 13(2), 140-148.—Presents data concerning color-form preference and ability to classify obtained from rural Zulu children with and without Western-type schooling, from literate and illiterate Zulu urban workers, and from illiterate urban workers. Significant differences are shown between children in school and those not going to school, between literate and illiterate urban workers, between illiterate urban and farm workers. Some comparisons are made with R. G. Suchman's data on Moslem Hausa children, J. Gay and M. Cole's data on Kpelle children, J. S. Bruner and associates' studies of Wolof children, and N.

L. Corah's data on American children. It is concluded that even a poorly equipped and poorly staffed Western-type school in the bush "seems to be a powerful agent for changing the direction in which the course of human cognitive development will flow." (15 ref.)—*Journal abstract.*

7835. Smulders, F. J. De pseudoherediteit van gedragsmodaliteiten: Een konfliktologische visie op de normering van menselijk gedrag. [The pseudo-heredity of behavioral modalities: A conflictual analysis.] *Gawein*, 1969(Jun), Vol. 17(4), 172-193.—Develops the theory that behavior is primarily environmentally determined. The only thing hereditary is the possibility of responding at all; the precise way of responding is culturally determined. Cathexis and introjection are the major tools in this process.—S. G. Vandenberg.

7836. Staub, Ervin. (Harvard U.) **Helping a person in distress: The influence of implicit and explicit "rules" of conduct on children and adults.** *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 137-144.—Examined the influence of variation in information about the permissibility of behavior involved in helping on subsequent attempts to help in response to sounds of severe distress from an adjoining room. In Exp. I 40 7th grade boys and girls who received prior permission to enter the adjoining room attempted to help more often than those who did not. In Exp. II 33 7th grade girls who received permission helped more than those who received no information or those who received a prior prohibition against entering the adjoining room. Prohibition and no information had about the same effects. In Exp. III 56 adult females helped a distressed female significantly more following both permission and no information than following prohibition, with no difference between the former 2 groups. Behavior that is thought to be highly valued culturally seems easily inhibited by counterinfluences including beliefs about appropriate social behavior and explicitly stated expectations of others that prohibit behavior involved in helping. (19 ref.)—*Journal abstract.*

INFANCY

7837. Barber, Lucie W. (Union Coll., Character Research Project) **Effect of an infancy curriculum on motor and personal-social behaviors.** *Character Potential*, 1971(Feb), Vol. 5(3), 128-147.—Parent reports on 16 infants were coded for Gesell normative behaviors. The agreement of 2 independent judges that evidence for a normative behavior existed was stipulated. Each separate Gesell behavior was recorded with the age in weeks when it occurred. Graphs for each of the 16 Ss were constructed to describe each behavior and illustrate by how many weeks it either exceeded Gesell norms or lagged behind norms. Categories for motor and personal-social behaviors were kept separate. The criterion for classifying an infant as benefiting from the infancy design rested on an overall pattern of acceleration which increased with age. Each case history was judged. The results of a previous study on language development were included in the discussion. All infancy design children benefited in at least 1 area. 7 benefited in all 3, while 4 benefited in 2 of the 3 categories of behavior. Language and personal-social advantage to the infancy design children were most pronounced. The large differences discovered using innovative procedures warrant further research.—*Author abstract.*

7838. Barber, Lucie W. (Union Coll., Character Research Project) **Language development in infants enrolled in the infancy design.** *Character Potential*, 1971(Feb), Vol. 5(3), 118-128.—Parents of 19 infants reported on infant language behavior from the time the infants were first enrolled until the children were 24 mo. old. These data were compared to Gesell norms for each child. Infants were judged as having benefited from the infancy design if their language development exceeded norms and increasingly so with age. 15 benefited, 2 did not, while no conclusions were reached for the remaining 2. Accelerated language ability was not the primary purpose of the infancy design. It was 1 of many areas studied with personality integration as the chief concern.—*Author abstract.*

7839. Barber, Lucie W. (Union Coll., Character Research Project) **The effects of an infancy curriculum on character development.** *Character Potential*, 1971(Feb), Vol. 5(3), 147-151.—Parents of infants enrolled in an infancy curriculum and parents of infants without exposure to the curriculum completed an open-ended statement of their child's self. An instrument was used which elicited information on purposiveness, value integration, and social effectiveness. Pairs were achieved that matched sex, age, and socioeconomic background. There were 19 pairs that were judged by 5 judges. When 4 or 5 judges agreed on a pair member as superior, reliability was assumed. Results strongly indicate that infants exposed to the infancy design exceeded infants not so exposed in 2 dimensions: values and social (17 to 7 and 20 to 5, respectively). Judges were not in agreement on the purposiveness dimension which could indicate a problem of definition of this dimension in infancy. Findings further indicate that infants with early exposure to the curriculum fared better than late starters. Other findings are included from this exploratory research which will be of interest to those involved in the infancy period.—*Author abstract.*

7840. Barber, Lucie W. (Union Coll., Character Research Project) **The infancy design in relation to other infancy research: A search of the literature.** *Character Potential*, 1971(Feb), Vol. 5(3), 107-111.—There is great current interest in infancy research. A large share of this research is related to the poverty problem; the poor environment for cognitive development of disadvantaged infants, and how to correct deficiencies to insure later academic success, thus breaking the poverty cycle. How does research with the infancy design to which only advantaged infants have been exposed relate to research with the disadvantaged? This article scans all infancy research and places the infancy design and its research, described in other articles in the same journal, in context. Learning by conditioning and individual differences in infancy are examples of other areas of infancy research that are examined besides the area of extra stimulation for disadvantaged infants. Certain distinctions are made (the infancy design's aim is character development—not just cognitive development or acceleration of infant behaviors; and theoretical explanations for a relationship transcending the distinctions are provided. The infancy design is an innovative program and the importance of relating this new educative approach to other infancy research is recognized as beneficial to all. (26 ref.)—*Author abstract.*

7841. Barber, Lucie W. & Hedges, Elizabeth W. (Union Coll., Character Research Project) **Family**

background and socio-economic environment of infants enrolled in the infancy design. *Character Potential*, 1971(Feb), Vol. 5(3), 114-118.—Describes the sample for 6 other studies in the same journal. The families who volunteered their participation in the infancy design (a curriculum for character development in infants) were above average in socioeconomic status, education, prenatal care of mother, physical condition of infant, and exposure of child to environment. The infants began life highly advantaged. The infancy design made already abundant stimuli more appropriate and meaningful to the maturation of unique infants.—*Author abstract.*

7842. Barber, Lucie W. & Hedges, Elizabeth W. (Union Coll., Character Research Project) **Research results with the infancy design.** *Character Potential*, 1971(Feb), Vol. 5(3), 112-114.—Summarizes the results of 7 studies described in the same journal. 1 study describes the sample. 2 studies compare infants exposed to the infancy design with Gesell norms. The infancy design children are clearly accelerated in either language, personal-social, or motor development, and combinations of the 3. The aim of the infancy design is to promote character development in infancy along 3 dimensions: purposiveness, value integration, and social effectiveness. Results from the 4th study were inconclusive for purposiveness but strongly suggest an effect of the infancy design on value integration and social effectiveness. The concluding 3 studies present an innovative method for studying a unique infant. Elements to explain personality integration were recognized and quantified from parent reports on 1 infant from 5-30 mo. of age. Consistent patterns over time were found.—*Author abstract.*

7843. Campos, Joseph J., Langer, Alan, & Kowitz, Alice. (U. Denver, Behavior Development Lab.) **Cardiac responses on the visual cliff in prelocomotor human infants.** *Science*, 1970(Oct), Vol. 170(3954), 196-197.—Previous studies, reporting marked emotionality in animals placed directly over the visual cliff's deep side, suggested that the autonomic responses of infants placed directly over either side of the cliff might serve to discriminate the deep from the shallow sides. In an experiment with 31 human infants younger than crawling age, it was found that Ss yielded reliable cardiac decelerations when placed directly atop the deep side of a visual cliff and generally nonsignificant changes when atop the shallow side. Distress was elicited less frequently, however, on the deep side than on the shallow at these ages, in contrast to the behavior of older infants and other species. Prelocomotor infants, therefore, can discriminate the 2 sides of the cliff, but not by means of distress at loss of optical support.—*Journal abstract.*

7845. Hedges, Elizabeth W. (Union Coll., Character Research Project) **Evidence of self in an infant at five months and thirty months of age.** *Character Potential*, 1971(Feb), Vol. 5(3), 157-159.—The self element includes one's basic drives and desires. Evidence of the self element was coded in open-ended reports by parents on their infant son who was enrolled in a home-based infancy curriculum. Reports chosen were from 5-7 mo. of age and, again, from 24-30 mo. of age. 2 matrices were constructed, 1 for each time period, and a cluster

analysis was performed. 3 judges interpreted the clusters. 2 important findings resulted: (a) the self could be described even at these early ages, and (b) there was a consistency of basic drives and desires from the early age to the later age for this infant. The study belongs to a series of studies reported in the same journal on a new approach to training infants. The purpose for training is character development and the core of the program is parents' recognition of their infant's unique self.—*L. W. Barber.*

7846. Hedges, Elizabeth W. (Union Coll., Character Research Project) **Purposiveness, value integration, and social effectiveness in an infant from five months to thirty months of age.** *Character Potential*, 1971(Feb), Vol. 5(3), 160-162.—Parent reports on an infant enrolled in an infancy curriculum were coded for an M element. The M element is "measures of character dimensions orientation." The dimensions were: purposiveness, value integration, and social effectiveness. The reports were also coded for each of these dimensions. The open-ended reports were written reports of behavior from 5-30 mo. of age. Frequencies of codes when put in graph form indicated a pattern which suggests that the infant was consistently higher in the social dimension than in values, with purposiveness increasing with age. This pattern was interrupted only around 1 yr. when the infant was perfecting walking skills and was able to verbalize value preferences for the first time. Thereafter the original pattern returned. This study along with others in the same journal presents an innovative method for studying personality development in infants.—*L. W. Barber.*

7847. Hedges, Elizabeth W. (Union Coll., Character Research Project) **The presence and frequency of personality elements in one infant, five months to thirty months of age.** *Character Potential*, 1971(Feb), Vol. 5(3), 152-157.—Parent reports on a male infant from 5-30 mo. old were coded for 15 "elements" of personality. These elements are members of a mathematical group by which personality integration can be described. Evidence on all but 1 element (vision) was found, although frequencies of codes were low for judgment, courage, roles, and decision-making. The following elements were coded most frequently: endowments, action, growth and maturation, self, measures of character dimensions, and learning. Evidence was found for the other 4 elements: home resources, evaluation, world, and philosophy of values. The definitions of the elements are presented and illustrations found of them in the infant's behavior. This is a new and possibly valuable approach to the study of infancy.—*L. W. Barber.*

7848. Jordan, T. E. & Spaner, S. D. (U. Missouri, St. Louis) **Biological and ecological influences on development at 12 months of age.** *Human Development*, 1970, Vol. 13(3), 178-187.—Reported a multivariate analysis of development at the end of 1st yr. of life, and analyzed the contribution of biological data, and 2 aggregates of environmental data to the study of development at age 12 mo. The case histories of 353 12-mo-old children were drawn from a prospective longitudinal study of development in the preschool years.—*Journal abstract.*

on the origin and development of various movements in the 1st yr. of life, including the results of studies on the development of movements in 2-yr-old children characterized by severe hypotrophy and acute retardation of development.—I. D. London.

7850. Munroe, Ruth H. & Munroe, Robert L. (Pitzer Coll.) **Household density and infant care in an East African society.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 3-13.—Carried out time- and event-sampling observations of infant care among 12 Logoli households. High household density was associated with frequent holding of the infant and small latency of response to crying. However, the infant's mother was somewhat less accessible to him in the high-density household. The mother's lower availability was probably due to her greater economic responsibilities in a large household. Findings support the view that ecological variables can influence socialization practices. (18 ref.)—*Author abstract*.

7854. Williams, Herman. (Union Coll., Character Research Project) **Possible applications of an infancy curriculum.** *Character Potential*, 1971(Feb), Vol. 5(3), 163-165.—The infancy design, developed by the Union College Character Research Project, has been used in infants' families for 3 yr. Initial research indicates acceleration in motor, language, and personal-social behaviors, as well as advancement in value integration and social influence. Revision and further research will be continued. Although the infancy design has been used with middle-class Ss, it has also been applied in the case of training home educators who help mothers of disadvantaged infants in an innercity project. Both the research and the practical applications will be continued.—L. W. Barber.

7855. Williams, Herman & Barber, Lucie W. (Union Coll., Character Research Project) **Description of an infancy curriculum for character development.** *Character Potential*, 1971(Feb), Vol. 5(3), 99-106.—The Union College Character Research Project has worked with character education for 35 yr. In 1967, the decision was made to add an infancy curriculum to the existing nursery-senior high curriculum. Developing purposiveness, value integration, and social effectiveness was the goal of the infancy design. The method involved drawing parents' attention to maturations so that appropriate stimuli could be introduced to the infant. Basic to the design was parents' learning about their child's unique self. This introductory article describes the infancy design and how it has been used by participating families.—L. W. Barber.

7856. Zelazo, Philip R. **Smiling to social stimuli: Eliciting and conditioning effects.** *Developmental Psychology*, 1970(Jan), Vol. 4(1, Pt. 1), 32-42.—In Exp. I, 1 male and 1 female E each tested 5 male and 5 female infants (11-13 wk. old). 1 block (2 6-min trials) of base

rate and 5 blocks of conditioning were run over 3-4 days. During base rate, Es were unresponsive; during conditioning, each infant smile received contingent smiling, talking, and touching. Results show differential smiling to E during base rate, a significant but scalloped decline in smiling to contingent stimulation, and a need to rigidly control ITIs. In Exp. II, 1 female E examined 10 Ss in each of 3 conditions: contingent and noncontingent stimulation, and an unresponsive control. 3 6-min trials were run each day for 3 consecutive days. Results reveal a significant linear decline over trials and days for all groups with an attenuation of the decline on Trial 1 and from Day 1-2 for the contingent condition. A 2-process view of smiling is proposed involving reinforcement and habituation effects. (26 ref.)—*Journal abstract*.

CHILDHOOD

7857. Benavent Oltra, Jose A. (U. Valencia, Spain) **Génesis de la risa infantil.** [Origin of laughter in children.] *Anuario de Psicología*, 1970, Vol. 1(2), 107-114.—Examines the development of laughter in children from 0-14 yr. old and concludes that, contrary to psychoanalytic theories, a child is able to laugh at a very early age (2 mo.). As the child develops, the stimuli for laughter gradually multiply until, at the age of 10, he acquires an understanding of that which is comical. His laugh reaches full maturity at 14, at which point he is able to appreciate humor. Any type of laugh that can be observed thereafter in an adult will have already appeared in the child. This does not mean that those situations which cause a child to laugh will produce the same effect in an adult. It is suggested that the best stimuli for laughs are always those situations that are particular to the age and last functional or intellectual achievement of the moment. Thus any stimulus that brings about a child's laugh has its parallel in an adult. It is proposed that such parallel situations be searched and outlined whereby the causes and types and laughs can be studied. (41 ref.)—S. Maze.

(Northwestern U.) **Effects of film material upon children's behavior.** *Psychological Bulletin*, 1971(Jan), Vol. 75(1), 50-59.—Reviews studies of symbolic modeling influences upon human behavior. Experiments concerned with film influences upon aggression, phobic and altruistic responses, as well as their impact upon social judgments and communications are discussed. (38 ref.)—*Journal abstract*.

7860. Candiani Moncalvo, Ernesta. (U. Turin, Graduate School of Psychology, Psycho-Pedagogy, & Pedagogy, Italy) **Intorno ad un aspetto del comportamento morale di bambini immigrati.** [On one aspect of moral behavior in immigrant children.] *Rivista di Psicologia Sociale e Archivio Italiano di Psicologia Generale e del Lavoro*, 1970(Jan), Vol. 37(1), 53-81.—Semin's test of moral judgment was administered to local northern (N = 35) and southern (N = 39) immigrant children of elementary school age in the suburbs of Milan, Italy. The immigrant children tended to give a significantly greater number of responses of a sociocentric (rather than egocentric) nature. This propitiatory, ingratiatingly sacrificial attitude appeared related to age and length of residence in the North of Italy. (French & English summaries)—L. L'Abate.

7861. de Moffarts, M. (25 rue Charles Degroux, Brussels, Belgium) **Le choix de la main pour l'écriture: Etude au Niveau préscolaire.** [The choice of hand for writing: Study at the preschool level.] *Revue de Psychologie et de Sciences de l'Education*, 1970, Vol. 5(3), 309-316.—19 left-handed or ambilateral preschool children were compared with a random sample of 40 right-handed preschool children by means of neurological and psychomotor tests. All parents were interviewed regarding their attitudes toward the etiology and importance of handedness. Parents' attitudes were, for the most part, liberal. Establishment of preference, except for cases of retarded neurological maturation, is established by the end of the kindergarten period. Motivation and affective factors are important and, if these are taken into account, intervention which begins early enough will usually lead to the establishment of right-hand preference. (Dutch & English summaries)—S. S. Marzolf.

7862. Dusek, Jerome B. (Syracuse U.) **Experimenter bias in performance in children at a simple motor task.** *Developmental Psychology*, 1971(Jan), Vol. 4(1, Pt. 1), 55-62.—54 boys and 72 girls of CAs 6-7 were tested by neutral Es, or Es biased to expect boys (or girls) to drop marbles faster than girls (or boys) in a marble dropping task. $\frac{1}{2}$ of the Ss were tested under conditions of social reinforcement and $\frac{1}{2}$ under conditions of nonreinforcement. Es were 18 male undergraduates. There were 2 dependent variables: a base-rate score and 6 difference scores. Girls had a higher base rate than boys. The difference scores indicate a significant main effect due to E bias for girls but not for boys. Results do not support (a) the hypothesis of a greater bias effect in the social than in the nonreinforcement condition, or (b) a cross- or same-sex effect for the neutral Es. Results are related to previous studies of social reinforcement in children. (23 ref.)—*Journal abstract.*

Torino, Inst. of Experimental & Social Psychology, Turin, Italy) **Effetti del linguaggio dell'adulto sul pensiero e sul linguaggio del fanciullo.** [The effects of adult language on thinking and language of the child.] *Rivista di Psicologia Sociale e Archivio Italiano di Psicologia Generale e del Lavoro*, 1970(Jan), Vol. 37(1), 3-22.—The verbal help of a grown-up influences operational and verbal solutions of 5-6 yr. olds in different ways, according to the frequency and manner of intervention. A type of verbal guidance helped specifically in lowering the frequency of mistakes made during test performance. (French & English summaries)—L. L'Abate.

7865. Flapan, Dorothy & Neubauer, Peter B. (Teachers Coll., Columbia U., Psychological Consultation Center) **Issues in assessing development.** *Journal of the American Academy of Child Psychiatry*, 1970(Oct), Vol. 9(4), 669-687.—Presented some of the difficulties and problems encountered in a study of the development of children attending community nursery schools, and suggested directions for further investigations of children's development. Among the issues considered are: the conceptualization of health, the problems of validity and reliability, the prediction of developmental progression and postdiction, the role of symptoms, the determination of developmental interference, and the

definition of variations in development. Implications of these issues for clinical diagnosis, treatment, and judgments concerning the development of the children in a community are discussed. The criteria used to determine which children need treatment and to decide on the choice of treatment technique for a particular child are questioned, and the broader question of recommendations for community mental-health programs is examined.—*Journal summary.*

7866. Herzka, Heinz S. (Child Psychiatric Service of the Zürich Cantons, Switzerland) **Die Bedeutung der Spielsachen für die Reifung des Kindes.** [The meaning of toys for the maturation of children.] *Heilpädagogische Werkblätter*, 1970(Sep), Vol. 39(5), 225-231.—Toys are an example for the meaning that objects can possess for the development and education of children. The meaning can be divided into functional and educational values. Educational values influence the logical, esthetic, emotional, and ethical development of the child, while functional values concern the environmental situation (living architecture, playground layout) as well as the planning, manufacture, and sales of toys in a narrower sense. Toys are of similar value as books and other educational and informative media engender.—R. F. Wagner.

7867. Hirschhorn, Theodora. (Inst. for Emotional Education, New York, N.Y.) **Jacob's log: On teaching a two-year-old to handle fear.** *Journal of Emotional Education*, 1969(Spr), Vol. 9(2), 69-75.—Defines discipline as "teaching the child to recognize and handle his needs." Teaching the child to discipline himself is 1 of the objectives at the Institute for Emotional Education. A log book is presented which illustrates the steps and progress in teaching a 2 yr. old to cope with fear.—B. A. Stanton.

7868. Hoffman, Martin L. (U. Michigan) **Conscience, personality, and socialization techniques.** *Human Development*, 1970, Vol. 13(2), 90-126.—Divided 7th graders with internal moral orientations into humanistic and conventional groups on the basis of moral judgment responses. A 3rd group oriented toward detection and punishment (external) was also selected. The humanistic and conventional Ss were found similar to each other and higher than the external on guilt, confession, acceptance of blame, and parent identification; their parents were reported to express affection and use induction discipline more frequently, and power assertion less frequently. The major differences were (a) the humanistic Ss appeared more tolerant of antimoral impulses, (b) more apt to experience guilt as a direct result of awareness of consequences of their behavior for others, and (c) more identified with personal characteristics of their parents. Their parents' discipline techniques were more varied. The conventional Ss appeared to be more repressed, more apt to experience guilt as a result of their own impulse expression rather than the harm done to others, and more identified with the power aspect of the parental role. Their parents' discipline was characterized by frequent use of love withdrawal and inductions highlighting the harm done to the parent by the child's action. The differences, especially on the guilt and repression indexes, were more pronounced for boys than girls. Findings are discussed and interpreted in terms of a general analysis of the discipline encounter and the attempt was made to link them with trends among today's youth. (27 ref.)—*Journal abstract.*

7869. Kogan, L. N. (Ed.) *Molodēzh, eē Interesy, stremeniya, idealy*. [Youth, its interests, strivings, ideals.] Moscow, USSR: Molodaya Gvardiya, 1969. 431 p.—Presents a collection of 17 sociological and social psychological papers, read at the 1967 All-Union Scientific Theoretical Conference on Socialism and Youth held in Moscow.—I. D. London.

7870. Kohlberg, Lawrence. (Harvard U.) *The child as a moral philosopher*. *Psychology Today*, 1968(Sep), Vol. 2(4), 25-30.—A 12-yr study of the moral development of 75 boys supported the theory that moral thought develops in a stage sequence independently of specific experience. The 3 stages are: preconventional (an orientation toward punishment and self-needs), conventional (obedience to rules and support of the social order), and postconventional (espousal of principles that have generality beyond the group). Cross-cultural comparisons suggested that the general sequence is not altered by the culture although the rate of progression through the stages may be different.—E. J. Posavac.

7871. Laurence, Joan E. *White socialization: Black reality*. *Psychiatry, Washington, D.C.*, 1970(May), Vol. 33(2), 174-194.—Asserts that political socialization is a process beginning in childhood, and a number of definitions are discussed. 178 black and 821 white children from 5th, 6th, and 8th grade integrated classes filled in a questionnaire in March, 1968. Feelings of general efficacy within the political system and information on politics is constant among younger black and white Ss, but older black Ss had less information and felt less efficacious than whites. A number of specific variables are questioned including feelings for minority groups, responses to black power, trust of policemen, and the Vietnam war. Attempts to increase political socialization of blacks is seen to be futile as long as what is taught is in contrast to the reality of their lives. 2 suggestions for reducing polarization and immunizing conflict between the races are (a) intensifying efforts for socialization of white children in the area of racial realizations, and (b) changing attitudes of black children by changing the reality of their circumstances.—E. M. Uprichard.

7872. MacMillan, Donald L. & Keogh, Barbara K. (U. California, Riverside) *Effects of instructional set on twelve-year-old children's perception of interruption*. *Developmental Psychology*, 1971(Jan), Vol. 4(1, Pt. 1), 106.

7873. Marsden, Gerald. (U. Michigan, Medical Center) *Intelligence and the Rorschach whole response*. *Journal of Projective Techniques & Personality Assessment*, 1970(Dec), Vol. 34(6), 470-476.—Previous research on the relation between intelligence and Rorschach whole (W) responses has produced inconclusive results. The problem was reexamined with methodological improvements. Ss were 58 8-14 yr. old boys. Rorschach W responses were coded to H. Friedman's developmental scoring system, and response frequencies in these categories were correlated with WISC IQ and subtest scaled scores. IQ scores were significantly related to 1 of 2 types of developmentally advanced W responses as predicted ($r = .33$), and no meaningful pattern of correlations was found between the developmentally more primitive types of W responses and IQ. (31 ref.)—*Journal abstract*.

7874. McKeever, Walter F. & Huling, Maurice D. (Ventura County Mental Health Dept., Calif.) *Lateral dominance in tachistoscopic word recognitions of*

children at two levels of ability. *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 600-604.—Studied monocular tachistoscopic word recognition performance as a function of word placement to the right or left of fixation in 20 7th grade children. $\frac{1}{4}$ the Ss possessed normal reading skills, while the other $\frac{1}{4}$ read at a 3rd grade level. Words directed to the left cerebral hemisphere (right field words) were recognized significantly more often ($< .005$) in both groups than words channeled to the right hemisphere. The result supports the view that right field recognition superiority reflects the language specialization of the left hemisphere rather than training of the left hemiretinae through the acquisition of reading proficiency.—*Journal abstract*.

7875. Peto, Andrew. (Albert Einstein Coll. of Medicine, Yeshiva U.) *To cast away: A vestibular fore-runner of the superego*. *Psychoanalytic Study of the Child*, 1970, Vol. 25, 401-416.

7876. Rabinowitz, F. Michael & DeMyer, Sandra. (Tulane U., Newcomb Coll.) *Stimulus and response alternation in young children*. *Developmental Psychology*, 1970(Jan), Vol. 4(1, Pt. 1), 43-54.—Investigated in 3 experiments the stimulus and response alternation of 72 preschool and 66 kindergarten children. Of major interest are the findings that (a) stimulus alternation decreased as stimulus meaningfulness increased, (b) stimulus alternation increased as stimulus discriminability increased, (c) response alternation increased as stimulus discriminability decreased for kindergarten Ss but decreased for preschool Ss, (d) stimulus alternation remained relatively constant across trial blocks for kindergarten Ss but decreased across trial blocks for preschool Ss, (e) response strategies were more pronounced in girls than boys, and (f) choice latencies were faster on stimulus-alternation trials than on stimulus-repetition trials with the more discriminable pair of stimuli.—*Journal abstract*.

7877. Siegel, Alexander W. & McBurney, Donald H. (U. Pittsburgh) *Estimation of line length and number: A developmental study*. *Journal of Experimental Child Psychology*, 1970(Oct), Vol. 10(2), 170-180.—96 children from 6-13 yr. old and 16 adults matched handgrip force to length of lines and verbally presented numbers. Slopes of the matching functions increased with age, with the greatest differences in slope being found between 11-13 yr. on both tasks. Response variability was not a function of age, indicating that in spite of systematic differences among age levels, the method used has promise for the assessment of perceptual and cognitive skills of young children whose facility with the ratio properties of numbers cannot be assumed. *Journal abstract*.

7878. Swingle, Paul G. & Condy, Henry V. (McGill U., Montreal, Quebec, Canada) *Social class, age, and the nature of the incentive in children's lever-pressing performance*. *Canadian Journal of Psychology*, 1969(Feb), Vol. 23(1), 41-48.—96 middle class (MC) and lower class (LC) 6-, 10-, and 15-yr-old schoolchildren lever pressed for a 2 min. practice, followed by a 5-min session reinforced on a fixed-interval 30-sec schedule with money, a verbalism ("good"), both money plus "good," or nothing. Results indicate that MC sensitivity to verbal incentive and LC sensitivity to monetary incentive become pronounced as the child grows older since no differences between LC and MC were found for the youngest Ss. Data also suggest that sensitivity to the reinforcing properties inherent in a task does not develop

as rapidly in LC as in MC Ss. (French summary)
—*Journal abstract.*

7879. Vijftigschild, W., Berger, H. J., & van Spaendonck, J. A. *Interpretatie en greep op de werkelijkheid van alledag: een sociale interpretatie test.* [Intelligence and the grasp of everyday life reality; A social interpretation test.] *Gawein*, 1969(Jun), Vol. 17(4), 161-171.—Constructed a Social Interpretation Test which provides information about a child's individual response to situations arising in daily life. Binet's work was used as a basis. An attempt was made to develop a type of test that would satisfy psychometric conditions, and allow the S a margin of freedom. 1 finding is that S's scores gained in this test do not necessarily agree with the level of general intelligence as expressed in an IQ score.—*English summary.*

7880. White, Elliott. (Temple U.) *Intelligence, individual differences, and learning: An approach to political socialization.* *British Journal of Sociology*, 1969(Mar), Vol. 20(1), 50-68.—Proposes a general 4-stage model of political socialization, based on the principle that socialization involves a mutual interaction between the child and his environment. The 1st facet of the political socialization process is considered to be the agents of socialization: the family, church, school, peers, mass media, etc. These agents act on the child through the 2nd aspect of the process—learning—according to generally accepted (connectionist or cognitive) principles. Developmental theory, the 3rd facet, is also applicable to political socialization and suggests the importance of cognitive aspects of learning. If the 4th facet, cognitive abilities, is indeed paramount, then individual differences in political socialization can be traced to differences in conceptual or cognitive ability. Specifically, it is asserted that the politically active, as opposed to passive, individual tends to be more intelligent, cognitively more abstract and conceptual, more internally motivated, and personally more effective.—K. G. Shaver.

7881. Yoshikawa, Tomizo; Yagishita, Toyoko, & Matsuda, Yaeko. (Mukogawa Women's U., Nishinomiya, Japan) *Color-mood associations in young children.* *Psychologia: An International Journal of Psychology in the Orient*, 1970(Mar), Vol. 13(1), 57-58.—Previous research by other investigators found a close relationship between mood-tone and color choice among nursery school children. An attempt was made to determine if Japanese children of the same age had "good" color-mood associations. Ss were 307 children from 3 kindergartens and 1 nursery school, about evenly divided by sex. Ages ranged from 5-6½ yr. Apparatus consisted of 2 crayons of different color, white paper with a drawing of a girl on it, and 2 short stories, 1 sad, 1 happy. Some Ss heard the former, the others the latter. Ss colored the girl's dress with either crayon they chose. No significant sex differences were obtained. A chi-square test indicated a mood-color choice relationship.—R. D. Nance.

Learning

7882. Brown, Richard A. (Michigan State U.) *The effect of alternating social approval comments and tangible rewards on task performance of kindergarten children.* *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1530.

7883. Burt, David L. & Knull, W. D. (U. Alberta, Edmonton, Canada) *A comparative study of different*

modes of presentation on efficiency of learning and retention. *Alberta Journal of Educational Research*, 1970(Sep), Vol. 16(3), 149-156.—Studied the problem of learning and retention with special consideration given to single channel presentation modes. 120 8th graders were exposed to 1 of 3 learning tasks (paired associates) and were posttested for retention on a strict schedule. The learning tasks were presented with a constant printed word stimulus. The responses were printed words, pictures, and spoken words depending on the experimental treatment group. Students in the picture response group made correct associations with fewer errors and retained information over the 7-day period significantly better than did the other 2 experimental groups.—*Journal abstract.*

7884. Flavell, John H., Friedrichs, Ann G., & Hoyt, Jane D. (U. Minnesota) *Developmental changes in memorization processes.* *Cognitive Psychology*, 1970(Oct), Vol. 1(4), 324-340.—Studied developmental changes in 2 broad classes of memory-related phenomena using nursery school, kindergarten, and 2nd and 4th grade children as Ss: (a) the production and strategic deployment over time of various types of memorization activities; (b) S's knowledge concerning his own memory. With regard to the former class, only the older Ss tended to show a specific, fairly complex memorization strategy when given unlimited time to study a set of items to the point of perfect serial recall. The strategy appeared to consist of first naming the items to oneself to initiate the learning process, and of subsequently using systematic anticipation and rehearsal procedures to monitor and maintain one's gradually increasing state of recall readiness. As for the latter class, the older Ss were likewise better able than the younger ones, both to predict their own memory span in advance of any concrete memorization experience, and to assess their readiness to recall after such experience. It is concluded that the 2 phenomena are intimately interrelated in the older child's memorization activities and that the nature and development of S's knowledge and awareness of his own memory system is a particularly important and timely research problem.—*Journal abstract.*

7885. Fleming, James T. (U. California, Graduate School of Education, Los Angeles) *Oral language and beginning reading: Another look.* *Reading Teacher*, 1968(Oct), Vol. 22(1), 24-29.—In confirming the relation between oral language and beginning reading assumptions about both the nature of language and the reading act must be clear. As a substantial part of developing sound programs, more research is needed wherein the instruments used to measure reading achievement or language development, must incorporate some of the relatively recent findings of linguistic research. It is concluded that in any rank ordering of language priorities or objectives, there would seem to be no debate about placing competence in reading well ahead of the acquisition of language etiquette. (22 ref.)—P. D. Leedy.

7886. Frith, Uta. (Medical Research Council Developmental Psychology Unit, London, England) *Memory coding for binary sequences in children.* *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 618-630.—10 3-5 yr. old children with a short memory span and 10 5-7 yr. old children with a long memory span recalled binary word sequences of different structure. It was found that the difficulty of recall was mainly determined by the run structure but not by the cyclicity of the sequences. Incorrectly recalled

sequences were systematically analyzed in terms of 2 supposed coding mechanisms, i.e., feature extraction and pattern imposition. It could be demonstrated that certain features of the presented sequences were preserved while others usually were not. While the extracted feature served as a basis for reconstruction of the sequence in recall, the obtained sequences showed in addition certain characteristics which appeared to be unrelated to the input. Some differences in the efficiency of coding were found between 4 and 6 yr. olds. However, it appeared that the coding strategies were similar at lower and higher levels of memory capacity and development. —*Journal abstract.*

7890. King, Mary L. (U. Mississippi) **The effectiveness of social reinforcement on a motor performance of Negro preschool children as a function of socioeconomic level.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1540-1541.

7891. Levin, Joel R. (Wisconsin Research & Development Center, Madison) **Factors related to the sentence facilitation of paired-associate learning: Some characteristics of verbs.** *Journal of Educational Psychology*, 1970(Dec), Vol. 61(6, Pt. 1), 431-439.—Reports 2 paired-associate learning experiments with 75 6th graders. On the study trials, the to-be-learned paired associates were embedded in 3-word sentences of the form noun-verb-noun. Ss were cued for recall of the 2nd noun by either the 1st noun (N), the verb (V), or the 1st noun plus the verb (N + V). Results show that: (a) the type of test cue provided made a difference, with N and N + V producing better recall than V; (b) neither prelearning instructions nor the amount of implied activity of the verb connectives had an effect on performance; and (c) the usual finding that sentence-embedded paired associates are easier to learn than nonsense paired associates was not demonstrated. (24 ref.)—*Journal abstract.*

7892. Muñoz Perez, Francisco. (U. Barcelona, Spain) **Actividad de organización y capacidad de aprendizaje verbal en el niño de ocho a doce años.** [Organization and learning in an 8 to 10 year old child.] *Anuario de Psicología*, 1970, Vol. 1(2), 65-84.—Performed an experiment of free recall learning on 3 groups of 16 normal children, ages 8-13, from an all boys school

in Paris. 13 different 1-min tests, consisting in recalling in writing a list of 12 2-syllable meaningful words, were administered to these Ss. The order of words varied each time. Results show that (a) learning increased according to age, though not in every case; (b) learning occurred throughout the experiment and that the test factor was important; (c) there were no basic differences of learning development among the 3 groups; (d) organization increased progressively with the tests in all 3 groups; and (e) the data established by organization increased with each age group. It is concluded that: (a) organization and the amount of words learned increased with each test; (b) the Ss who organized more were those who learned more words; (c) as of the age of 8, a child is able to spontaneously develop a method of organizing material to be learned; (d) this organization is a factor (though not the only 1) at every age level which determines the number of words learned; (e) there is a correlation between the development of a capacity for organization between the ages of 8 and 12 and a capacity for learning; and (f) the development of the organization process is greatly responsible for the development of learning and determines its progress and stability between the ages of 8 and 10. 7895. Williams, Eddie H. (U. Southern California) **Effects of readiness on incidental learning in EMR, normal, and gifted children.** *American Journal of Mental Deficiency*, 1970(Sep), Vol. 75(2), 117-119.—Investigated the effects of readiness on incidental learning among 30 educable mentally retarded (EMR), 30 normal, and 30 gifted Ss who were equated on CA (84-119 mo.). Ss were divided into readiness and nonreadiness treatment groups. The incidental learning stimuli were presented with the intentional learning materials. The criterion measure was based on the incidental learning task. When readiness was given, EMR, normal, and gifted Ss did not differ in incidental learning; when readiness was not given, they did. Readiness was found to benefit EMR and normal Ss while it had no effect on gifted Ss.—*Journal abstract.*

7896. Brainerd, Charles J. & Allen, Terry W. (U. Windsor., Div. of Developmental Psychology, Ontario, Canada) **Experimental inductions of the conservation of "first-order" quantitative invariants.** *Psychological Bulletin*, 1971(Feb), Vol. 75(2), 128-144.—Reviews experiments that have attempted to train Piaget's concrete conservations. Pertinent theoretical and meth-

odological issues are summarized. Empirical questions are posed concerning: (a) whether or not conservations are trainable, (b) what training methods are most effective, (c) whether or not specific transfer of training occurs, (d) whether or not nonspecific transfer or training occurs, (e) whether or not some conservations are more resistant to extinction than others, and (f) whether or not "natural" conservers are more resistant to extinction than trained conservers. On the basis of currently available data, reasonably complete answers to questions a, b, c, and e are advanced, and judgment is reserved on questions d and f. (58 ref.)—*Journal abstract.*

7897. Bresnahan, Jean L. & Blum, William L. (Emory U.) **Chaotic reinforcement: A socioeconomic leveler.** *Developmental Psychology*, 1971(Jan), Vol. 4(1, Pt. 1), 89-92.—Presented 60 1st grade children from 2 different socioeconomic levels with a concept-acquisition problem after either 0, 6, or 12 trials of random reinforcement. The overall performance of high socioeconomic level Ss was superior to low socioeconomic level Ss, but results also indicate a significant interaction between socioeconomic level and number of random reinforcements. With an increase in the number of random reinforcements, the behavior of high socioeconomic level Ss deteriorated to the same level as low socioeconomic level Ss. The experimental manipulation of prior reinforcements produced low socioeconomic level behavior in high socioeconomic level Ss. Data are interpreted as further evidence that the inconsistent reinforcement histories of low socioeconomic level children contribute to their typical ineffectual performance.—*Journal abstract.*

7898. Bronckart, J. P. (U. Liège, Lab. of Experimental Psychology, Belgium) **Le rôle régulateur du langage chez l'enfant: Critique expérimentale des travaux d'A. R. Luria.** [The regulatory role of language in the infant: An experimental critique of A. R. Luria's studies.] *Neuropsychologia*, 1970(Nov), Vol. 8(4), 451-463.—Attempts to verify experimentally results obtained by A. R. Luria (see PA, Vol. 36:4GH48L) in his studies on the regulatory role of language, and to analyze the results more deeply. 12 experiments, standardized with 67 normal 1½-6½ yr. old Ss, were conducted. In the 1st series of tests, inspired directly by those of Luria, the importance of other people's language in the initiation of this regulation is demonstrated by showing the precise moment when these functions appear. In the 2nd series, the role of the language of the child himself, is studied trying to evaluate separately the evolution of motor and verbal responses, before deciding on the eventual effect of 1 type of response on the other. It is demonstrated that the regulatory role of language of the child is only important in those situations in which verbal development precedes motor development. This role can only be ascribed to vocal emission which, eventually, reinforces a positive motor act of the same rhythm. (German summary)—*English summary.*

7900. Di Vesta, Francis J. & Walls, Richard T. (Pennsylvania State U.) **Factor analysis of the semantic attributes of 487 words and some relationships to the conceptual behavior of fifth-grade children.** *Journal of Educational Psychology*, 1970(Dec), Vol. 61(6,

Pt. 2), 1-15.—Presents mean ratings of 487 words on 8 semantic differential scales by 5th grade Ss and on Emotionality, Concreteness, and Imagery scales by 15 undergraduates. Frequency counts, primary associates, and probability of association were summarized from other sources where available. The 4 factors of evaluation, activity, concreteness, and potency were extracted via a factor analysis of the intercorrelations among the 11 scales. For emotionally neutral words, but not for affectively polarized words, there was a moderate correlation between evaluation factor scores and imagery, and between imagery of a word and its probability of association with its primary associate. Semantic factor scores of stimulus words were moderately correlated with semantic factor scores of their primary associates when opposites were excluded. Several experiments, in which these norms have been employed, are described together with the implications of the findings for understanding the emergence of affective meaning systems. 7901. Grimmer, Sadie A. (U. Arizona) **The influence of ethnicity and age on solving Twenty Questions.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 143-144.—Contrasted 156 males belonging to 2 low income ethnic groups with 40 white males of a middle income ethnic group and evaluated them for categorizing, strategy, and conceptual tempo via the game of Twenty Questions. Age and socioeconomic status were found to influence level of performance. The only dependent measure affected by ethnicity was tempo rate.—*Author abstract.*

7902. Hornby, Peter A., Hass, Wilbur A., & Feldman, Carol F. (U. Chicago) **A developmental analysis of the "psychological" subject and predicate of the sentence.** *Language & Speech*, 1970(Jul), Vol. 13(3), 182-193.—Studied the early development of the distinction between the "psychological" subject and predicate and to determine its relationship to the grammatical subject and predicate distinction. In the 1st task, 8 kindergarten and 8 2nd grade Ss selected the most important word in each of several sentences. In the 2nd task, 2 more groups of Ss at the same age levels produced opposites for the same set of sentences. It was found that, the younger Ss' responses could be accounted for by factors of semantic features of individual words, the older Ss consistently centered on the grammatical predicate as the locus of opposition and most important word. This shift to the predicate in the older Ss was characterized by an emphasis on the verb. (19 ref.)—*Journal abstract.*

7903. Kasdorf, C. A. & Schnall, M. (Rice U.) **Developmental differences in the integration of picture series: Effects of variations in object-attribute relationships.** *Human Development*, 1970, Vol. 13(3), 188-200.—Studied the effects on integration of variables which contextualize picture series in terms of everyday life: object familiarity and appropriateness of attribute change to the object. Also, integration of color, shape, and position changes were compared. 176 Ss in 3 age groups (mean ages: 6.8, 11.11, 19.7) were subdivided into matched groups; each viewed series manifesting a different contextuality condition: familiar object-appropriate (FA) change, familiar object-inappropriate (FI) change, and geometric object-attribute change same as in other conditions (G). Integration was found to increase between 6 and 11 yr.; varied with contextuality condition (FA>FI>G), different contextuality condi-

tions being the focus of challenge for different age groups; and was less for color changes than for shape or position changes.—*Journal abstract.*

7904. Klahr, David & Wallace, J. G. (Carnegie-Mellon U.) **An information processing analysis of some Piagetian experimental tasks.** *Cognitive Psychology*, 1970(Oct), Vol. 1(4), 358-387.—1 of the fundamental problems in the study of cognitive development is the determination of the developmental relationship between particular cognitive skills. An indication of its complexity is provided by the research literature centered on Piaget's concept of a "stage" in intellectual development. The first steps in an attempt to tackle this issue from a new methodological orientation based upon an information processing analysis are presented. A simple model of the problem-solving processes which appear to underlie successful performance on a range of experimental tasks testing concrete operations is described. It is analogous to a computer assembly system, with the major processes consisting of encoding of external stimuli, assembly of a task-specific routine from a repertoire of fundamental processes, and execution of the task-specific routines sufficient to perform successfully are described in terms of the fundamental processes. It is argued that since the complex task-specific routines consist of components that contain motivational and attentional mechanisms, no simple ordering of concrete operational tasks can be expected. Some new directions for experimental work are suggested. (24 ref.)—*Journal abstract.*

7905. Marsh, Jayne & Fitch, James. (Central State Hosp., Milledgeville, Ga.) **The effect of singing on the speech articulation of Negro disadvantaged children.** *Journal of Music Therapy*, 1970(Fal), Vol. 7(3), 88-94.—"1 of the greatest deficits of the culturally deprived child is in the area of communication and language skills . . . This deficit becomes a crucial barrier when the child is to be educated outside his usual environment, as in the plight of the southern Negro child newly placed in an integrated educational situation . . . Although much attention has been given to the language deficits of the culturally disadvantaged child by various socially-oriented professions, the field of music therapy has not yet developed its potential in this area. It is conceivable that any language program for the disadvantaged would greatly stress oral language skills . . . and singing would seem to be a valuable tool in teaching such skills to children. Few references can be found in the music therapy literature which pertain to the use of music in the improvement of speech patterns." An attempt was made to determine the effect of singing specially composed music on: (a) the articulation of ending consonants as pronounced in continuous speech by southern Negro children, and (b) the syllabic frequency in continuous speech of southern Negro children. Ss were 30 4th, 5th, 6th graders. Although the results were not statistically significant, it is felt there was enough improvement in certain areas to warrant further research. (15 ref.)—*F. O. Triggs.*

7906. Masland, Mary W. & Case, Linda W. **Limitation of auditory memory as a factor in delayed language development.** *British Journal of Disorders of Communication*, 1968(Oct), Vol. 3(2), 139-142.—Describes some of the facets of auditory memory involved in the recall of verbal language. 4 aspects of auditory memory are considered: temporal span, temporal se-

quence, temporal patterning of pitch, rhythm and stress, and patterning of phonetic detail. The interrelationships of these aspects within the linguistic framework of what K. S. Lashley called serial order temporal integration are brought out. Illustrations from the case histories of preschoolchildren delayed in language development are presented.—*Journal abstract.*

7907. Morra Pellegrino, M. L. & Garibbo Giuganino, B. M. (U. Genoa, Inst. of Psychology, Italy) **Confronto di alcuni indici psicolinguistici applicabili al linguaggio scritto e orale in età evolutiva.** [The confrontation of some psycholinguistic indications applicable to the written and oral language in the evolutive age.] *Rivista di Psicologia Sociale e Archivio Italiano di Psicologia Generale e del Lavoro*, 1970(Jan), Vol. 37(1), 99-108.—The Buseman verbs/adjectives ratio and the Osgood-Walker nouns and verbs/adjectives and adverbs ratio showed an increase with increasing age with 90 9-, 11-, and 14-yr-old Ss. The Buseman ratio seemed more appropriate than the latter in its application to developmental stages. (English & French summaries)—*L. L'Abate.*

7908. Pascual-Leone, Juan. (York U., Toronto, Ontario, Canada) **A mathematical model for the transition rule in Piaget's developmental stages.** *Acta Psychologica, Amsterdam*, 1970(Aug), Vol. 32(4), 301-345.—Conceptualizes Piaget's cognitive-developmental variable as a quantitative construct, the central processor M. The set measure of M, i.e., the maximum number of discrete chunks of information or schemes that M can control or integrate in a single act, is assumed to grow in an all-or-none manner as a function of age in normal Ss. The M measure is taken as the quantitative characteristic of each developmental stage. M values for the Piagetian stages were inferred from Piagetian data and postulated as experimental hypotheses. A new compound-stimuli visual information (CSVI) type of task was designed for testing quantitatively the M construct. The stochastic model used for these predictions in the CSVI task is the Bose-Einstein occupancy model of combinatorial analysis. Successful results from 2 different series of studies with 5, 7, 9, and 11 yr. olds are reported. In addition, the manifestation at the performance level of the hidden parameter M is shown to be mediated by a number of moderator variables. (4 p. ref.)—*Journal abstract.*

7909. Sapon, Stanley M. (U. Rochester, Verbal Behavior Lab.) **Contingency management in the modification of verbal behavior in disadvantaged children.** *IRAL: International Review of Applied Linguistics*, 1969(Feb), Vol. 7(1), 37-49.—Reports modification of verbal behavior of 10 2.5-3.5 yr. old nursery school children. Individual acceptable responses were rewarded with tokens that could be used to operate timed, self-terminating, audiovisual reinforcing devices. Contingency management (CM) procedures were transferred to the general school area, as well as the functioning of a token economy during play and mealtime. It is concluded that (a) disadvantaged Ss did not display any striking differences in response to CM procedures that have been successfully applied to middle class Ss, (b) the strategies involved in training seem valid, and (c) verbal behavior in very young Ss was amenable to modification under CM procedures. (French & German abstracts)—*M. West.*

7910. Schludermann, Shirin & Schludermann, Eduard.

(U. Manitoba, Winnipeg, Canada) **A comparative factorial analysis of semantic structures in monolingual Indian and American school children.** *Canadian Journal of Psychology*, 1969(Apr), Vol. 23(2), 79-92.—430 monolingual, Hindi-speaking elementary school children in India and 200 English-speaking Ss in the United States rated 15 concepts on 15 bipolar semantic scales. Factor analyses yielded a bifactor common space for the United States sample, and 3- and 4-factor space for the 8- and 12-yr-old Ss, respectively, in the Indian sample. The common denominator, evaluative, potency, and activity semantic space, was observed in both cultural samples. The 2 sample factor structures showed evidences of factorial congruence. Between sample factorial dissimilarities are suggested to be due to Culture-Concept-Scale interactions. (French summary)—*Journal abstract*.

7911. Schweitzer, Thomas M. & Schnall, M. (Brandeis U.) **Sequence effects in the abstraction of the concept of progressive change.** *Human Development*, 1970, Vol. 13(3), 201-202.—Descriptions of changes as opposed to states are viewed as reflecting an abstract integrative conceptualization when S applies them to picture series depicting steps in the progressive alteration of an object's attributes. 1 concrete-familiar (A) and 3 geometric series (B, C, D) were used, where B, C, and D were respectively decreasingly similar to A. 125 Ss, mean age 7.5 yr., were divided into groups which viewed 1 of the sequences: ABD; ACD; ADD; BAD; BDD. Descriptions of D served as the test trial. S's descriptions were significantly affected by ordering of experiences from concrete to geometric and by similarity between the 1st 2 orienting series. Within the age range studied, suggestive tendencies differentiating oldest and youngest Ss were observed.—*Journal abstract*.

7912. Taylor, Ann. (U. Toronto, Inst. of Child Study, Ontario, Canada) **Followup of institutionalized infants' concept formation ability at age 12.** *American Journal of Orthopsychiatry*, 1970(Apr), Vol. 40(3), 441-447.—Describes a study, made previously by A. Taylor (see PA, Vol. 45:Issue 5) demonstrating that the normal sequence of conceptual development was reversed in 10 children reared for the 1st 3 yr. of life in an institution. The reversal occurred between the ages of 6 and 9. A further study made at age 12 indicates that by then Ss had demonstrated an ability to relearn a more mature conceptual approach. It is noted that the 2 most important steps in the retraining of inadequate cognitive processes were destimulation of the environment and the opportunity to regress to infantile and preschool levels of conceptualization.—*Journal abstract*.

7913. Vasić, Smiljka. **Jedna kvalitativna analiza dečjeg rečnika sa stanovišta psiholingvistike.** [A qualitative analysis of children's vocabulary from the standpoint of psycholinguistics.] *Psihologija*, 1969(Sep), Vol. 2(2), 400-420.—Investigated active children's vocabulary obtained from free essays written by elementary school children in Serbia and the United States. By means of the trend analysis, and the correlational and cluster analysis, the psychosemantic area of the active vocabulary of the Ss in these 2 linguistically and economically different environments was determined. Certain semantic universalities typical for children of elementary school age were determined. It was established that of the 100 observed nouns from the semantic atlas the words used with greatest frequency were home, man, sun, mother, water, meat, bird, river, and hand. The

only difference found was that Serbian Ss placed the word, home, 1st, while American Ss placed the word, mother, 1st. All kinds of nouns have an ascending trend in both vocabularies, the coefficient of direction being sharpest for the concrete nouns. A descending trend was found only for certain singular nouns typical for early childhood and for different economic environments. An even trend was observed for the nouns related to food-stuffs. Psychosemantic area of children's vocabulary is made up of 4 separate discrete groups: man, home, mother, and abstract nouns, which are highly correlated among themselves, but each represents a distinct psychosemantic whole. Irrespective of economic, cultural, social, and linguistic differences, there exists a certain fund of words which has the same dynamics of the development of use, conditioned by general development and growth of the child. It is concluded that different environmental conditions influence a child's vocabulary.—*English summary*.

Abilities

7915. Bannatyne, Alex D. & Wichiarajote, Penny. (U. Illinois, Inst. for Research on Exceptional Children) **Relationships between written spelling, motor functioning and sequencing skills.** *Journal of Learning Disabilities*, 1969(Jan), Vol. 2(1), 4-16.—Reports research on relationships between spelling ability, motor functioning, and various auditory and vocal skills with 50 3rd grade, 8-yr-old schoolchildren. (18 ref.)

7916. Bemelmans, F. (U. Laval, Quebec, Canada) **L'analyse clinique des aptitudes par les tests.** [Clinical analysis of aptitude by tests.] *Bulletin de Psychologie Scolaire et d'Orientation*, 1970(Mar), Vol. 19(1), 24-49.—Discusses aptitude prediction on the basis of Raven's Progressive Matrices Test, which is comprised of 38 matrices. It was administered to 371 9-yr-old Ss, 534 10-yr-old Ss, 575 11-yr-old Ss, and 457 12-yr-old Ss. Age norms and correlations between scholarly performance and test answers were correlated and discussed. Significant correlations were observed and described as items trying to form a "chain." Specific correlations between series and items were interpreted. It is concluded that the test is a useful tool for assessing normal development. (English summary)—*P. R. Shibleski*.

7917. Haber, Ralph N. (U. Rochester) **Eidetic images.** *Scientific American*, 1969(Apr), Vol. 220(4), 36-44.—Reports studies in the identification and examination of children possessing capacity for eidetic imagery. Approximately 20 2nd-6th grade children with apparent eidetic capacity were chosen from 500 tested for this ability. Questions by E regarding the eidetic image and Ss' responses were tape recorded, and an example of 1 child's verbal report of a picture just presented to him is included. Visual stimuli included composite pictures with vivid colors and objects, nonsense words, a succession of letters in a viewing window, and visual illusions, e.g., the Necker cube. Results confirm the presence of eidetic imagery. Characteristics of the recognition and fading of images are summarized.—*P. McMillan*.

7918. Keogh, Barbara K. (U. California, Los Angeles) **Pattern copying under three conditions of an expanded spatial field.** *Developmental Psychology*, 1971(Jan), Vol. 4(1, Pt. 1), 25-31.—75 boys and 60 girls (CAs 8-9) copied patterns by drawing and by walking in an expanded spatial field under 3 conditions: no defined reference points, reference points, and reference points plus visual tracking cues. Drawing differences among groups are nonsignificant. Boys were significantly better than girls in reproducing patterns by walking under 2 of 3 walking conditions. Boys improved in pattern walking across conditions as more visual cues were available; girls did not. Differences were reflected in objective scores and in styles of pattern walking. Findings suggest a sex difference in perceptual strategies in the organization of space.—*Journal abstract.*

7919. Kovacevic, Panta. **Standardizacija Kohn-Goldsteinovog Testa (modifikacija N. Granjon i H. Santucci).** [Standardization of the Kohn-Goldstein Test.] *Psihologija*, 1969(Sep), Vol. 2(2), 483-492.—Tested 400 7-10 yr. old elementary school children in Belgrade by Kohn's Block Design Test to determine the norms, the differences in achievement between Ss of different age, sex, and area of residence, and the metric characteristics of the test. It was established that there were no significant differences in the achievement on the test between Ss 7-8 and 8-9 yr. old, while the difference between Ss 9-10 yr. old was significant. Despite the fact that boys' mean scores are higher, the differences between the boys and the girls are not significant, with the exception of the subsample of 7-yr-olds from the suburbs. The achievement on the test of urban Ss is higher at the age of 7 and 9, while the differences for other age groups are not significant. As for the norms, a satisfactory solution had not been found so that when certain irregularities appeared, a single scale was proposed for the age of 7, 8, and 9, and a separate scale for the age of 10. Item analysis reveals that the models were not in satisfactory order in respect to difficulty of solution. By means of the mean correlation item-test, the reliability of the test was computed: $r_{tt} = .93$. Validity was estimated on the basis of the correlation between the test scores and 4 school ratings. Analysis of Ss behavior reveals typical errors in the task-solving process: (a) apraxis in construction, (b) erroneous orientation, (c) erroneous selection of colors, (d) use of smaller number of blocks for the construction of models, and (e) insufficiency of abstraction. High percentage of ego-centric speech was noted in some Ss. The concrete and the abstract levels of the problem-solving were distinguished.—*English summary.*

7922. Ramos Lopez, Elba C. (U. "Inca Garcilaso de la Vega," Lima, Peru) **Adaptacion de los subtests de vocabulario de las escalas de inteligencia Stanford-Binet Forma L-M y Wechsler para niños.** [Adaptation of the vocabulary subtest of the Stanford Binet (Form L-M) and Wechsler for children.] *Revista de Psicologia General y Aplicada*, 1970(Jan), Vol. 25(102), 53-68.—Reports on just the translated vocabulary subtest of

the Stanford Binet Form L-M and the WISC. 301 6-15 yr. olds of both sexes were selected randomly from the primary school system in Callao, Peru. The average performance of children in Callao was much less on the translated words than the norms on the original words for children in the United States. The mental ages and numbers of words known on the 2 tests correlated .68 and .74, respectively, showing only a moderate degree of equivalence. With restrictions as noted, the tests can be used with these tentative norms.—*D. H. Schuster.*

7923. Stevens, Joseph H. (George Peabody Coll. for Teachers) **Visual attending behavior and information processing ability in kindergarten age children as a function of socioeconomic status, type of preschool education, length of preschool education, and stimulus complexity.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1551.

7924. Turnure, James E. (U. Minnesota) **Control of orienting behavior in children under five years of age.** *Developmental Psychology*, 1971(Jan), Vol. 4(1, Pt. 1), 16-24.—Investigated the capability of young high-ability children to cope with extraneous distractive stimuli during performance on a 2-choice discrimination task. In Study I, 3.3-yr-old nursery school Ss in a noise condition exhibited significantly greater nontask orienting and significantly poorer learning than controls. In 40 Ss (3-9 and 4-9 yr. old) converse results prevailed, as the learning of noise condition Ss was enhanced compared to controls, and they exhibited less nontask orienting. In Study II with 28 Ss, an explanation of the previous results based on possible habituation to noise in the classroom prior to testing was investigated and found deficient. Results are interpreted as placing constraints on traditional views of children's distractibility, and as indicating that existing interpretations of the development of attentive abilities in children, based on an increasing attention span, need elaboration or reformulation. 7925. Wooster, Arthur D. (U. Nottingham, Inst. of Education, England) **Testing the ability to respond to verbal instructions.** *British Journal of Disorders of Communication*, 1968(Oct), Vol. 3(2), 156-160. Presents a method of investigating the young child's ability to understand and respond to verbal instructions, which does not require speech from the child. 64 5-5.5 yr. old children were employed and data is presented which enables some assessment of noncooperation, failure to learn, or the formation of idiosyncratic forms of usage to be made. The technique is shown to be valid and reliable over time.—*Journal abstract.*

Perception

7926. Bryden, M. P. (U. Waterloo, Ontario, Canada) **Laterality effects in dichotic listening: Relations with handedness and reading ability in children.** *Neuropsychologia*, 1970(Nov), Vol. 8(4), 443-450. Investigated dichotic listening performance in 234 children in Grades 2, 4, and 6. Right-ear superiority increased with age in right-handers and decreased with age in left-handers, the difference between right- and left-handers reaching significance at Grade 6. Generally, girls showed the adult pattern of ear dominance earlier than boys. In a subsample of 90, the relation between laterality effects and reading ability was investigated. Boys who were poor readers were more likely to show crossed ear-hand dominance than were boys who were good readers, but

this effect was only evident in 2nd grade girls. (French & German summaries) (21 ref.)—*Journal abstract*.

7927. Munroe, Robert L. & Munroe, Ruth H. (Pitzer Coll.) **Effect of environmental experience on spatial ability in an East African society.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 15-22.—Exploratory testing revealed that Logoli male children were more skillful than female children on maze tests and in the construction of diagonals. It was hypothesized that extensive movement through the environment (noted casually for males) might lead to enhanced spatial ability. An observational study of 30 3-7 yr. old Logoli children indicates that in free time boys were farther from home than age matched girls. It was also found that Ss who were farther from home were more skillful at the spatial task of copying block patterns. Possible contributions of innate sex and sex-role differences to male environmental experience and spatial abilities are discussed. (16 ref.)—*Author abstract*.

7928. Pedersen, Darhl M. & Pedersen, Nancy O. (Brigham Young U.) **The relationship between pitch recognition and vocal pitch production in sixth-grade students.** *Journal of Research in Music Education*, 1970(Fal), Vol. 18(3), 265-272.—54 6th graders were administered tests designed to measure knowledge of (a) musical symbols, (b) pitch discrimination, and (c) ability to vocally produce a pitch sounded on an instrument. Results indicate a significant relationship between b and c, a significant correlation between a and c, but an insignificant correlation between a and b, and insignificant differences in scores related to sex of Ss.—D. Higbee.

7929. Venger, L. A. **Vospriyatle i obuchenie.** [Perception and learning.] Moscow, USSR: Prosveshchenie, 1969, 368 p.—Presents the principles of perceptual development in preschoolchildren, and a psychological evaluation of the different methods of perceptual and sensory training, applied in current preschool pedagogy.—J. D. London.

7933. Epstein, Ralph & Komorita, S. S. (Wayne State U.) **Self-esteem, success-failure, and locus of control in Negro children.** *Developmental Psychology*, 1970(Jan), Vol. 4(1, Pt. 1), 2-8.—Evaluated personality and situational parameters related to internal-external control by investigating self-esteem and success-failure treatments. A 3 × 2 factorial design was employed with 20 4th-6th grade Negro boys in each of 6 experimental conditions. Results confirm the predictions that (a) failure rather than success experiences were attributed to external causes, and (b) high-self-esteem Ss were more

internal than low- or moderate-esteem Ss. Results imply that the belief in one's powerlessness, arising from membership in a stigmatized minority group, may be cushioned by a positive self-concept. (25 ref.)—*Journal abstract*.

7939. Neuringer, Charles & Livesay, Robert C. (U. Kansas) **Projective fantasy on the CAT and CAT-H.** *Journal of Projective Techniques & Personality Assessment*, 1970(Dec), Vol. 34(6), 487-491.—Compared the Children's Apperception Test (CAT) and its "human" equivalent the CAT-H for amounts of evoked projective fantasy in children. The 2 tests were given to 30 4th grade children of high, moderate, and low anxiety. The protocols were scored for 5 indices of productivity. They were (a) number of words, (b) number of emotional words, (c) number of expressed negative emotions, (d) adaptive mechanisms, and (e) Transcendence Index. Results indicate that there is little to choose between the 2 tests in terms of stimulating fantasy production. Neither was there a Test Form × Anxiety Level interaction found. (16 ref.)—*Journal abstract*.

7940. Pérez T., Aurora. **Relaciones objetales y etapas evolutivas.** [Object relations and evolutive stages.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969, Vol. 15(3), 227-232.—270 children were evaluated for prevalent complaints at different age levels and sex. All Ss were seen individually, in private practice. 174 were males and 96 were females, of normal intelligence, with an age range from birth to 12 yr. Dynamic, evolutive hypotheses were made, with emphasis on the status of the integration of object relations with the whole process of integration of the mental apparatus. The implications for therapy procedures are discussed.—*English summary*.

Parent-Child & Family Relations

7954. **Anthony, E. James & Benedek, Therese.** (Eds.) (Washington U., Medical School) **Parenthood: Its psychology and psychopathology.** Boston, Mass.: Little, Brown, 1970. xxiv, 617 p. \$15.—Focuses on parenthood in context of the biologic and environmental evolution of human behavior. The authors present material from a range of interrelated fields but maintain a consistent psychobiologic approach.

7955. **Barnett, Suzanne E.** (Michigan State U.) **Anxiety and negative feeling: Children's perceptions of family members.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1529.

7956. **Baumrind, Diana.** (U. California, Berkeley) **Current patterns of parental authority.** *Developmental Psychology*, 1971(Jan), Vol. 4(1, Pt. 2), 1-103.—Attempted (a) to replicate or modify parent-child relationships found in 2 previous studies by D. Baumrind

(see PA, Vol. 41:5780) and D. Baumrind and A. E. Black (see PA, Vol. 41:10271); and (b) to differentiate further among patterns of parental authority and measure their effects upon the behavior of preschool children. Data were based upon observational procedures, and were analyzed for boys and girls separately. Ss were 146 white preschool children and their families. Results include the following: (a) authoritative parental behavior was clearly associated with independent, purposive behavior for girls but only associated with such behavior for boys when the parents were nonconforming; (b) authoritative parental control was clearly associated with all indexes of social responsibility in boys compared to authoritarian and permissive parental control, and with high achievement in girls, but not with friendly, cooperative behavior; and (c) contrary to expectations, parental nonconformity was not associated with lack of social responsibility in either boys or girls. (45 ref.)—*Journal abstract*.

7958. Bell, Richard Q. (National Inst. of Mental Health, Child Research Branch, Bethesda, Md.) **Stimulus control of parent or caretaker behavior by offspring.** *Developmental Psychology*, 1971(Jan), Vol. 4(1, Pt. 1), 63-72.—Asserts that the child's contribution to parent-child interaction has been equated in the past with congenital and genetic factors, and thus neglected by socialization theorists who reacted with extreme environmentalism against instinct theory and other biological extensions of the theory of evolution. As a result, most investigators have considered the child an object on which parental actions are registered, rather than a participant in a social system, stimulating as well as being stimulated by the other. As a corrective, a way of thinking about the child's stimulus effects is advanced and applied to parent-child interactions observed in home settings. (35 ref.)—*Journal abstract*.

7959. Bernhardt, David K. (Ed.) (Carleton U., Ottawa, Ontario, Canada) **Karl S. Bernhardt: Being a parent: Unchanging values in changing world.** Toronto, Ontario, Canada: U. Toronto Press, 1970. x, 187 p. \$2.50(paper).

7960. Chu, Cheng-ping. (National Taiwan U., Taipei) **A study of the effects of maternal employment for the preschool children in Taiwan.** *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 80-100.—Compared 20 mothers who were employed with 20 who were not employed, each with a child in kindergarten. All Ss were of average or above average socioeconomic status and were interviewed, using a modified form of the Mother's Interview Schedule of R. R. Sears and Y. M. Wang. Data indicate that working mothers (a) give less time and personal care to their children and are less responsive to the child's crying; (b) are less strict toward the child's general behavior, but more strict toward eating and toilet training processes; (c) give more praise for obedience but may punish for dependency; (d) have higher self-esteem as individuals; and (e) delegate more housework and child care to their husbands. It is noted that the children of working mothers appear to demand more attention and need more love than children of non-working mothers. A reproduction of the Mother's Interview Schedule is included.—*P. McMillan*.

7961. Halpern, Florence. (Tufts-Delta Health Center, Mound Bayou, Miss.) **Self-perception of black chil-**

dren and the civil rights movement. *American Journal of Orthopsychiatry*, 1970(Apr), Vol. 40(3), 520-526.—Describes black parents' identification with or rejection of the civil rights movement as a source of confusion to their children, especially the middle-class child whose father has "made it." For all black children the movement provides a channel through which to express positive or negative feelings for the parents.—*Journal abstract*.

7962. Levenstein, Phyllis. (Mother-Child Home Program, Freeport, N.Y.) **Cognitive growth in preschoolers through verbal interaction with mothers.** *American Journal of Orthopsychiatry*, 1970(Apr), Vol. 40(3), 426-432.—Compared general and verbal IQs derived by the administration of the Cattell or Stanford-Binet Intelligence Scales and the Peabody Picture Vocabulary Test to 3 groups of 20-43 mo. old low-income preschoolers before and after exposure of the experimental group (N = 33) to 7 mo. of home sessions stimulating verbal interaction in mother-child dyads. The experimental group made highly significant cognitive gains in contrast to the 2 comparison groups of 21 Ss. (21 ref.)—*Journal abstract*.

7963. Medioli Cava, Franca. (U. Turin, Graduate School of Psychology, Psycho-Pedagogy, & Pedagogy, Italy) **Espressioni proiettive dell'ambiente sociale ed economico nel test della famiglia.** [Projective expressions of the social and economic environment in the family test.] *Rivista di Psicologia Sociale e Archivio Italiano di Psicologia Generale e del Lavoro*, 1970(Jan), Vol. 37(1), 23-52.—Social and economic factors tend to affect the number of members in Corman's Draw-a-Family Test. Southern, immigrant children, and children from lower socioeconomic levels tended to eliminate members of their families. (French & English summaries)—*L. L'Abate*.

7964. Poznanski, Elva; Maxey, Annette, & Marsden, Gerald. (U. Michigan, Children's Psychiatric Hosp.) **Clinical implications of maternal employment: A review of research.** *Journal of the American Academy of Child Psychiatry*, 1970(Oct), Vol. 9(4), 741-761.—Reviews in developmental sequence, the maternal-employment literature published since 1960, highlighting issues relevant to clinical work with children and families. It was found that: (a) studies in this area have produced few hard facts; (b) the effects of maternal employment probably depend on the developmental stage and ego maturity of the child; (c) maternal employment may increase dependency behavior and sexual identity problems, especially among lower-class children and under adverse conditions of intrafamilial strife; (d) generally, school achievement, particularly reading, is enhanced by maternal employment; (e) although maternal employment places stress on the family, it can be tolerated, and in some situations appears beneficial; and (f) inherent family stability is more important than maternal employment. It is noted that most authors in this area are women, and it is suggested that "women's motivation to study this problem may possibly spring from guilt as well as genuine concern with children, and perhaps a degree of feminism." (42 ref.)—*M. Maney*.

7965. Rothbart, Mary K. (U. Oregon) **Birth order and mother-child interaction in an achievement situation.** *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 113-120.—Investigated hypotheses about birth order and the antecedents of adult

achievement by observing mother-child interactions in a laboratory setting. Ss were 56 5-yr-old boys and girls and their mothers; $\frac{1}{2}$ of the children had a same-sex sibling who was approximately 2 yr. older than himself, and $\frac{1}{2}$ had a same-sex sibling, 2 yr. younger. Mothers supervised their child's performance on 5 tasks, and mother-child interaction data were examined as they related to birth order and sex of child. No differences were found in the amount of time mothers spent interacting with their children. In terms of the quality of interaction, however, mothers gave more complex technical explanations to 1st born children. They also exhibited greater pressure for achievement and greater anxious intrusiveness into the performance of the 1st born, with these findings accentuated in the mother's behavior toward the 1st girl. (18 ref.)—*Journal abstract.*

1966. Seitz, Willi; Wehner, Ernst G., & Henke, Margarete. (U. Würzburg, Psychological Inst., W. Germany) **Zusammenhänge zwischen elterlichem Erziehungsstil und Persönlichkeitszügen 7- bis 8 jähriger Jungen.** [The relationship between parental style of education and personality characteristics 7- to 8-year old boys.] *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1970, Vol. 2(3), 165-180.—Investigated intercorrelational and factor-analytic relations among several personality traits and parental attitudes toward child rearing. Ss were 42 7-8 yr. old male students. All of the 4 rotated factors showed covariance between children's personality and parental child-rearing attitude. As a personality measure, a German version of Coan and Cattell's Early School Personality Questionnaire was used. (English summary)—*R. F. Wagner.*

1967. Stapf, Kurt H. (U. Marburg, Inst. of Psychology, W. Germany) **Praktische Erfahrungen mit dem Messmodell von Rasch bei der Konstruktion von erziehungsspezifischen Einstellungsskalen.** [Practical experiences with Rasch's metric model in the construction of specific attitude scales.] *Psychologische Beiträge*, 1970, Vol. 12(1), 105-114.—Reports the construction of scales for determining parental behavior with G. Rasch's logistic test model. The advantages of scaling frequency and intensity previous to the essential application of the model are discussed. As an example a 9-item scale concerning punishment behavior is described. The strict criteria of the model are sufficiently valid for these items. (16 ref.)—*English summary.*

1968. Starr, Philip; Taylor, Delores A., & Taft, Ruth. (Child & Family Services of Connecticut, Hartford) **Early life experiences and adoptive parenting.** *Social Casework*, 1970(Oct), Vol. 51(8), 491-500.—Studied 340 couples with latency age adopted children regarding their characteristics at the time they adopted the child, their own early childhood experiences, and their current parent-child relationships. Responses were used to classify Ss into 2 distinct groups, and a sample was selected from each for intensive interviews. Early life experiences of the adoptive couples were found to be only minimally associated with their performance as parents. The adoptive couples tended to reinforce their own disciplinary experiences as children with their adoptive child. No relationship was found between nature of infertility and performance as parents. A substantial number of the children experienced behavioral difficulties in school and home.—*M. W. Linn.*

1969. Winkelmann, Wolfgang. **Verstärkung, Löschung und andere Erziehverhaltensweisen:**

Eine Befragung zu einem hypothetischen Erziehungsproblem. [Reinforcement, extinction and other means of educational behavior: A survey regarding a hypothetical educational problem.] *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1970, Vol. 2(3), 181-196.—208 students of a teacher training college were asked 2 questions concerning a hypothetical educational situation. Among other things, they had to suggest a parental attitude which they regarded as efficient so that the crying of a child would disappear when the mother leaves the room. Results show that only 16-21% of the students surveyed adhered to a strict reinforcement-extinction concept. There were significantly fewer answers implying extinction for the 1st question than were for the 2nd which had asked the students to conjecture about the previous behavior of the mother. (English summary) (15 ref.)—*R. F. Wagner.*

ADOLESCENCE

1970. Aarons, Z. Alexander. **Normality and abnormality in adolescence: With a digression on Prince Hal: "The sowing of wild oats."** *Psychoanalytic Study of the Child*, 1970, Vol. 25, 309-339.

1971. Duffy, Robert J. (U. Connecticut) **Description and perception of frequency breaks (voice breaks) in adolescent female speakers.** *Language & Speech*, 1970(Jul), Vol. 13(3), 151-161.—Made a phonelesopic investigation of the pitch characteristics of 24 11-, 13-, and 15-yr-old females. Data descriptive of the incidence, extent, and upper and lower limits of phenomena known as frequency breaks (voice breaks) are presented. Data are discussed and compared with similar data from other studies of males and females of various ages. Judgments by 5 trained listeners indicated that frequency breaks are not perceived as a pitch phenomenon, but are associated with the perception of "rough" vocal quality. Results are discussed in relation to vocal fry and harshness.—*Journal abstract.*

1972. Graff, Harold. (Eastern Pennsylvania Psychiatric Inst., Philadelphia) **The development of the adolescent.** *Pennsylvania Psychiatric Quarterly*, 1970(Spring), Vol. 10(1), 27-32.—States that adolescence itself is not an illness, that the great majority of children pass successfully through it with minimum problems and go on to become healthy adults. Though adolescent rebellion is a widely publicized, much discussed phenomenon, most adolescents become very much like their parents in outlook. The truly rebellious problem students are a small number, the majority of students participating in rebellious activities only for a good time and to be part of the crowd. From the sociological viewpoint, the problem adolescent is the product of injudicious permissiveness who cannot tolerate any form of restriction, becoming violent and destructive when thwarted, i.e., the extension of the childlike tantrum which brought satisfaction of his desires. From the psychiatric viewpoint, he has failed to develop inner controls and thus is incapable of tolerating frustration by finding effective and nondestructive ways of achieving his desires.—*M. Walker.*

1973. Harrison, Danny E., Bennett, Walter H., & Globetti, Gerald. (Mississippi State U.) **Attitudes of rural youth toward premarital sexual permissiveness.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 783-787.—Describes a comparative analysis of the premarital sexual attitudes of 83 white and 49 Negro

rural high-school students in a Southern community. As indicated by other studies, the degree of affection present in a relationship was a major factor in determining acceptability of advanced sexual activity. Neither Negro nor white Ss displayed a widespread predisposition toward promiscuous behavior. Several variations between the racial systems in the sociocultural factors which influence attitudes of permissiveness were noted. —*Journal abstract.*

1974. Hornbeck, Frederick W. (San Diego State Coll.) **Studies in forced compliance: IX. The effects of deception, commitment, and incentive on attitude change produced by the writing of a counter-attitudinal essay.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 63-72.—Studied 418 junior high school students, assigned to 1 of 8 conditions defined by the orthogonal variation of deception, commitment, and incentive. Although previously recognized conditions for the production of cognitive dissonance were met in at least some cells, Ss paid \$1.50 evidenced more attitude change than those paid \$.25 ($p < .001$). Patterns of within-cell correlations suggest that attitude change occurs as a result of self-persuasion during the process of role playing when conditions do not lead Ss to dissociate themselves from the content of their acts. When Ss do dissociate, attitude change may be effected by the perceived consequences of the act through "fait accompli" dissonance reduction. (16 ref.)—*Author abstract.*

1975. Keniston, Kenneth. (Yale U., Medical School) **Student activism, moral development, and morality.** *American Journal of Orthopsychiatry*, 1970(Jul), Vol. 40(4), 577-592.—Reviews recent studies of the development of moral reasoning and suggests optimism about the high level of moral development of most student activists. However, it is warned that any level of moral development in "the absence of a developed capacity for compassion, empathy, and love for one's fellow man" is dangerous. (46 ref.)—*Journal abstract.*

1976. Murray, Randall L., Cole, Richard R., & Fedler, Fred. (U. Minnesota) **Teenagers and TV violence: How they rate and view it.** *Journalism Quarterly*, 1970(Sum), Vol. 47(2), 247-255.—Data were gathered from questionnaires, telephone interviews, and content and regression analyses. From their definitions of violence and ratings of prime-time TV programs on the basis of violent content, teen-agers categorized violence into physical, mental, and verbal types, and generally defined violence as a "senseless phenomenon." Amount of violence viewed was defined as the product of frequency of viewing and violence ratings of programs divided by total programs watched. High and low users of violent content were rated on alienation and 11 other variables. Sex was the best predictor of violent viewing; males viewed more violent content. There was little relationship between alienation and viewing of violence. Relatively few teen-agers spent large amounts of time viewing TV. (18 ref.)—*J. A. Kline.*

1977. Philips, Irving & Szurek, Stanislaus A. (U. California, Medical School, San Francisco) **Conformity, rebellion, and learning: Confrontation of youth with society.** *American Journal of Orthopsychiatry*, 1970(Apr), Vol. 40(3), 463-472.—Describes clinical experience related to the confrontation of youth with society and hypothesizes that in our society the satisfaction associated with early successful learning is reduced and distorted during each developmental phase, so that

subsequent and continued learning is similarly affected. The inevitable frustration may be expressed by youth in the context of rebellion, alienation, and over-conformity. (16 ref.)—*Journal abstract.*

1978. Yagoda, Gerald R. (New York U.) **The relation of degree of emotional conflict to age and sex differences in adolescents.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1554-1555.

1979. Zytoskee, Adrian; Strickland, Bonnie R., & Watson, James. (Emory U.) **Delay of gratification and internal versus external control among adolescents of low socioeconomic status.** *Developmental Psychology*, 1971(Jan), Vol. 4(1, Pt. 1), 93-98.—Compared the responses of 76 Negro and 56 white 9th grade adolescents of low socioeconomic status concerning belief in internal vs. external control of reinforcement and delay of gratification under high- and low-status conditions. Negro Ss were significantly more likely to be external and less likely to delay gratification than their white counterparts. A Sex \times Race interaction approached significance with the difference between Negro and white females greater than the difference between Negro and white males in both internality-externality and delay of reinforcement. No relationship was found between internal-external control or the status conditions and delay behavior. (30 ref.)—*Journal abstract.*

ADULTHOOD & OLD AGE

1980. Dias Cordeiro, J. (Gulbenkian Foundation, Bel-Air Psychiatric Clinic, Geneva, Switzerland) **Les idées délirantes de préjudice.** [The delirious ideas of prejudice.] *Annales Médico-Psychologiques*, 1970(May), Vol. 1(5), 719-734.—Aged people often will ascribe to others' attacks on their personal property, health, or reputation. Although some writers attribute these prejudicial ideas to projection onto others of actions that the patient has himself performed but forgotten, it is asserted that memory defect is not essential. The phenomena may be understood by a psychodynamic perspective on the anxious and depressed state of pathological aging and the patients' need to defend against progressive deterioration. By displacing the anxiety to physical objects (finding them to be deteriorated or stolen), the patient compensates for his own deterioration. He becomes a center of interest for others and regards himself as a good object, i.e., worthy of being robbed. The patient is both the subject and the object of theft-by-aging. (English summary)—*H. E. King.*

1981. Green, Russel F. & Reimanis, Gunars. **The age-intelligence relationship: Longitudinal studies can mislead.** *Industrial Gerontology*, 1970(Sum), No. 6, 1-16.—Investigated the age-intelligence relationship in order to standardize a Spanish-language WAIS. Results indicate that an education-balanced group manifested no decline in performance due to age. As a check on this result which seemed to nullify several studies, a re-examination—and extension—of a longitudinal study was instituted. Ss, residents of a Veterans Administration hospital, had a mean CA at 1st testing of 57.15; at 2nd, 66.17; and at 3rd, 73.41. 1st and 2nd testing had been done by a PhD clinical psychologist and a testing technician using the WAIS. The 3rd testing was done by 2 MA psychologists using the Wechsler-Bellevue. Environmental and policy changes of the facility changed from the 1950s through the 1960s, improving motivation

for the 3rd testing. In the "under-65" retesting, the group as a whole averaged a decrease of 1 IQ point/yr. In the "over-65" group the annual decrease averaged .56 point/yr. Longitudinal studies are not necessarily more reliable for tracing age-related changes than certain other approaches.—A. M. Cawley.

SOCIAL PSYCHOLOGY

7985. ———. **Comments and queries: What social, what psychology, in social psychology?** *Psychological Record*, 1970(Sum), Vol. 20(3), 403-407.—Examines the nature of social psychology and its relation to general psychology and sociology. It is suggested that the discipline could more accurately be called cultural psychology; and that "cultural psychology should be devoted to the investigation of a particular type of behavior acquired in interaction with objects and conditions" that have derived their unique properties in various "artifactual environments."—S. Knapp.

7986. Anan'ev, B. G. & Kerimov, D. A. (Eds.) **Chelovek i obshchestvo.** [Man and society.] Leningrad, USSR: Leningrad U., 1969. 168 p.—Presents a collection of 19 articles on problems in sociopolitical management, problems in social planning, social and psychological problems of youth, and problems in the psychology of work. The collection constitutes Issue 5 of *Uchenye Zapiski* [Scientific Notes].—I. D. London.

7987. Campbell, Donald T., et al. **Experimental and quasi-experimental studies.** In E. R. Tuft (Ed.), "The quantitative analysis of social problems." (See PA, Vol. 45:Issue 5) 110-167.

7988. Chadwick-Jones, J. K. (University Coll., Cardiff, Wales) **Recent interdisciplinary exchanges and the use of analogy in social psychology.** *Human Relations*, 1970(Aug), Vol. 23(4), 253-261.—Social science disciplines are showing an increasing tendency to cross disciplinary lines and to develop areas of shared interest. Methods developed in 1 area of research are

being fruitfully applied in others. Theoretical analogies are being extended empirically to other areas of research interest, e.g., application of biological and engineering analogies to control of social variables. (49 ref.)—W. W. Meissner.

7989. Codol, J. P. (Centre National de la Recherche Scientifique, Social Psychology Lab., Aix-en-Provence, France) **Note terminologique sur l'emploi de quelques expressions concernant les activités et processus cognitifs en psychologie sociale.** [Terminological note on the use of certain expressions concerning cognitive activities and processes in social psychology.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(1-3), 63-71.—The description and study of cognitive activities and processes plays an increasingly important role in all divisions of present-day social psychology. Unfortunately, the special theories established in this field utilize terminological constructions at times so diverse that it is not rare, e.g., for a single fact to be designated by several different terms. The aim of this terminological note is to propose, concerning current usage of certain expressions in what may be conveniently called "cognitive theories," traditionally considered as relevant to social psychology (e.g., structural equilibrium, congruence principle, theory of cognitive dissonance, formation of impressions, implicit theory of personality, etc.), a simple and clear system designed to unify the vocabulary without attempting to discuss the theories as to content or implications. (62 ref.)—*English summary*.

7990. Marshall, James. **The evidence: Do we see and hear what it is? Or do our senses lie?** *Psychology Today*, 1969(Feb), Vol. 2(9), 48-52.—Sources of inaccuracy in the courtroom testimony of a witness include: the stress the witness was under during the event, the completion of forgotten details on the basis of what was remembered, the tendency to make inferences to unobserved events, the role played by the witness, the possible use of hypnotic suggestion, and the amount of information requested of the witness. Witnesses who changed testimony compared to those who did not change, and those who were suspicious of a line of questioning compared to those who were not, tended to give more accurate reports. It is urged that lawyers and social scientists conduct joint research on the validity of trial processes.—E. J. Posavac.

7991. Rapoport, Amos. (U. Sydney, New South Wales, Australia) **Symbolism and environmental design.** *International Journal of Symbolism*, 1970(Apr), Vol. 1(3), 1-9.—After pointing out the minor role of symbolism in environmental design, it is suggested that most building is essentially symbolic and some examples are given. It is further suggested that symbols play an important role in the way man perceives, evaluates, and shapes his environment. Given this apparent importance of symbols the question posed is why have contemporary designers neglected them. Some suggestions are made based on the distinction between the perceptual and associational worlds and the prevalence of idiosyncratic rather than shared symbols. Some implications of this are discussed. (26 ref.)—*Journal abstract*.

7992. Serraf, Guy. (U. Paris, School of Higher Commercial Studies, France) **Le psychologue et la recherche appliquée.** [The psychologist and applied research.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(1-3), 12-28.—Surveys the situation of the social psychologist in business, industry, and administration with respect to applied research, examining: (a) the present

status of applied psychological research; (b) the various fields of application of applied psychological research; (c) the tasks, duties, and methods of "psychosociologists"; (d) their background and training; (e) problems posed by the role of the research psychologist; and (f) communications and conditions of the integration of social psychologists within organizations. The educational standards, career prospects, and criteria for success and promotion of social psychologists engaged in applied research are appraised.—*T. N. Webster.*

1993. Tufte, Edward R. (Ed.) (Princeton U.) **The quantitative analysis of social problems.** Reading, Mass.: Addison-Wesley, 1970. 449 p. \$6.95(paper).

G. **Metodologiya i protsedura sotsiologicheskikh issledovanii.** [Methodology and procedure of sociological research.] Moscow, USSR: Mysl', 1969. 207 p.—Analyzes the methodological and technical procedures used in sociological and social psychological research. Illustrative use is made of recent materials gathered by field investigators in Moscow, Leningrad, and Novosibirsk.—*I. D. London.*

CULTURE & SOCIAL PROCESSES

1995. Bridger, Wagner H. (Pavlovian Society, Princeton, N.J.) **Pavlovian principles and social issues.** *Conditional Reflex*, 1970(Jul), Vol. 5(3), 180-184.—Discusses the relevance of the concepts and methods of Pavlovian research to crucial issues facing man in society and concludes that they are applicable. It is suggested that the study of higher nervous activity can shed light on social problems. Concepts discussed as illustrative of this viewpoint include signalization, individual differences in temperament, and the 2nd signal system.—*P. McMillan.*

1996. Brody, Eugene B. (U. Maryland) **Migration and adaptation: The nature of the problem.** *American Behavioral Scientist*, 1969(Sep), Vol. 13(1), 5-13.—Discusses the adaptation of migrant, his way of establishing and maintaining a stable, reciprocal relationship with his new environment in terms of intrapsychic and interpersonal elements. These are constantly in play during the process of migration as it involves changes in attitudes, relationships, and behavior and a move across physical space and social system boundaries. Special attention is paid to the interrelationship between donor system and host system factors, as they mutually influence each other, the migrant and his family.—*Journal summary.*

1997. Cohen, Rosalie A. (U. Pittsburgh) **Conceptual styles, culture conflict, and nonverbal tests of intelligence.** *American Anthropologist*, 1969(Oct), Vol. 71(5), 828-856.—Focuses on (a) incompatibility in conceptual styles as a notable indicator of culture conflict and on the characteristics that distinguish it from deprivation and culture difference, and (b) styles of conceptual organization as culture-bound characteristics of nonverbal intelligence tests. Evidence is presented of the reciprocal relationships between conceptual styles and styles of primary group process. (16 ref.)—*Journal summary.*

1998. Eaton, Joseph W. (U. Pittsburgh) **Reaching the hard-to-reach in Israel.** *Social Work*, 1970(Jan), Vol. 15(1), 85-96.—Analyzes the nature and impact of voluntary programs for adolescents and discusses the characteristics of the hard-to-reach, culturally deprived poor who are usually children of parents born in

Afro-Asian countries. Data were obtained from a questionnaire survey of adolescents in a metropolitan suburb in Israel. It is concluded that although these Ss are consistently underrepresented in youth group activities, a noteworthy proportion can be reached when special efforts are made to include them.—*Journal abstract.*

1999. Ekman, Paul & Friesen, Wallace V. (U. California, San Francisco) **Constants across cultures in the face and emotion.** *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 124-129.—Investigated the question of whether any facial expressions of emotion are universal. Recent studies showing that members of literate cultures associated the same emotion concepts with the same facial behaviors could not demonstrate that at least some facial expressions of emotion are universal; the cultures compared had all been exposed to some of the same mass media presentations of facial expression, and these may have taught the people in each culture to recognize the unique facial expressions of other cultures. To show that members of a preliterate culture who had minimal exposure to literate cultures would associate the same emotion concepts with the same facial behaviors as do members of Western and Eastern literate cultures, data were gathered in New Guinea by telling 342 Ss a story, showing them a set of 3 faces, and asking them to select the face which showed the emotion appropriate to the story. Ss were members of the Fore linguistic-cultural group, which up until 12 yr. ago was an isolated, Neolithic, material culture. Results provide evidence in support of the hypothesis. (30 ref.)—*Journal abstract.*

1900. Hanson, Robert C. & Simmons, Ozzie G. (U. Colorado, Inst. of Behavioral Science) **Differential experience paths of rural migrants to the city.** *American Behavioral Scientist*, 1969(Sep), Vol. 13(1), 14-35.—Based on an analysis of the urban experiences of 4 groups of migrants, a method for examining their adjustment process is illustrated. "The composition of the groups is held constant while . . . what happened to each group on a series of variables describing their urban experiences over time" is observed. "An interpretation of some of the conditions and processes producing the variety of adjustment outcomes evident in the case histories of rural migrants to the city" is presented.—*G. Steele.*

1901. Kearny, Michael. (U. California, Riverside) **An exception to the "Image of Limited Good."** *American Anthropologist*, 1969(Oct), Vol. 71(5), 888-890.—Indicates an exception to G. M. Foster's theory of limited good, that in the Mexican world view all desirable material and nonmaterial entities are seen as existing in finite amounts which cannot be augmented. In the Zapotec town of Ixtepeji, the cycle of fiestas is examined as a culturally sanctioned respite from the struggle for existence. In such a community it is implicitly assumed that one can experience intensified desirable emotions without necessarily suffering a loss in some other area of life, as is implied by the "image of limited good."—*Journal abstract.*

1902. Lambert, W. E. (McGill U., Montreal, Quebec, Canada) **What are they like, these Canadians? A social-psychological analysis.** *Canadian Psychologist*, 1970(Oct), Vol. 11(4), 303-333.—Presents an analysis of Canadians and Canadian society from (a) a social-psychological perspective, and (b) a personal view based on 15 yr. of involvement. Studies are presented as

samples of the larger "Canadian mosaic." Social interactions within groups of both English-Canadian (EC) and French-Canadian (FC) communities are discussed, and child training values compared. EC and FC groups in interaction in areas, e.g., levels of aspiration, personality adjustment of adolescents of mixed English-French parentage are discussed, and a report of attempts to reduce intergroup tension is presented. The study concludes with an appraisal of the shared, the partly shared, and the unique characteristics of Canadians with respect to other people. (40 ref.)—*P. McMillan.*

8003. Lipowski, Z. J. (McGill U., Montreal, Quebec, Canada) **The conflict of Buridan's ass or some dilemmas of affluence: The theory of attractive stimulus overload.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 273-279.—Outlines a motivational theory of human behavior that considers the effects on the individual of certain ubiquitous features of affluent societies, which provide an overabundance of attractive stimuli and alternatives related to material and symbolic values. Such an overabundance leads to intrapsychic conflict between incompatible approach tendencies, exemplified by the parable of Buridan's ass. Conflicts of this type have widespread effects on human behavior and on mental health. A need for revision of current psychodynamic theory of intrapsychic conflict is pointed out, and the practical implications of the proposed theory for psychiatric intervention are emphasized. (18 ref.)—*Journal abstract.*

8004. Marcovitz, Eli. (Jefferson Medical Coll., Philadelphia, Pa.) **Aggression, dignity and violence.** *Pennsylvania Psychiatric Quarterly*, 1970(Spr), Vol. 10(1), 49-64.—Describes aggression as a generic concept, covering a wide spectrum of behavior and relationships which range from activity towards an object, i.e., curiosity and investigation, to the most violent forms of destruction. Some of the categories of aggression described are self-assertion, mastery over others, and hostility. Aggression, unlike violence, is seen as the stimulus of civilization. Violence is defined as hostility translated into action and may occur when a goal-directed activity is frustrated. Violence may be the outcome of hatred caused by being betrayed by love or trust, being shamed or humiliated, or being envious or jealous. Dignity is equated with well-being that comes from self-liking and self-esteem based on the feeling of having some degree of power in relation to inner or outer forces. Current violence on the American scene is discussed. It is concluded that any hope of eliminating violence from human interpersonal or intergroup behavior is utopian and that violence can only be controlled.—*M. Walker.*

8005. Rogin, Michael. (U. California, Berkeley) **Politics, emotion, and the Wallace vote.** *British Journal of Sociology*, 1969(Mar), Vol. 20(1), 27-49.—An analysis of 1964 Presidential primary and general election voting patterns in Indiana and Wisconsin was conducted, together with interviews of politicians, newspapermen, and union officials in the metropolitan areas of these states. Results show that greatest primary support for Wallace derived from white- and blue-collar racial prejudice activated by proximity to Negroes (especially near urban ghettos). Although Goldwater's support in the general election did not dramatically deviate from traditional Republican bases, the most substantial shifts that did occur could be traced to pro-Wallace sentiment in counties where race was a

salient issue. Finally, the interview data suggest that the Wallace vote, an emotional rather than political response, attained the size it did partly because local political organizations and workers, in pragmatic attempts to remain nonideological, did not oppose his candidacy with conviction.—*K. G. Shaver.*

8006. Thomine-Desmazures, Micheline. (National Inst. of Agronomic Research, Paris, France) **Diagnostic de la viabilité sociale de deux communes rurales.** [A diagnosis of the possibilities of social survival of two rural communes.] *Economie Rurale*, 1968(Jul), No. 77, 25-33.

Ethnology

8007. Boyer, L. Bryce & Boyer, Ruth M. (3021 Telegraph Ave., Berkeley, Calif.) **Aportes psicoanalíticos y antropológicos a la tarea con minorías étnicas.** [Psychoanalytic and anthropological insights in working with ethnic minorities.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969(Mar), Vol. 15(1), 25-33.—Describes psychoanalytic and anthropological experiences with Apache Indians of the Mescalero Reservation in New Mexico. Social structure, child rearing patterns, and the personality organization of the group studied are emphasized, and comparisons of aboriginal vs. modern patterns are made when appropriate. The implications for the social worker who has to deal with ethnic minorities is discussed.—*English summary.*

8008. Dizard, Jan E. (Amherst Coll.) **Black identity, social class, and black power.** *Psychiatry, Washington, D.C.*, 1970(May), Vol. 33(2), 195-207.—Examines the phenomenon of black identity or group consciousness and the current manifestations of it in the black community, particularly the politically relevant aspects of growing black community identity. 1160 black residents of Berkeley, California were interviewed in 1967 on a wide range of attitudes and experiences. High attachment to black identity was higher in younger and better educated blacks. Lowest attachment was seen in proprietors-managers, service workers, and craftsman. These groups also were lower in militancy. An increase in black identity and group pride and "a growing sharpness in the conflict between black and white" are predicted. (24 ref.)—*E. M. Uprichard.*

8009. Forbes, Gordon B. & Mitchell, Shirley. (Millikin U., Psychology Lab.) **Attribution of blame, feelings of anger, and direction of aggression in response to interracial frustration among poverty-level female Negro adults.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 73-78.—Administered a test to 31 low socioeconomic class 20-60 yr. old female Negroes, depicting Negroes frustrating whites and whites frustrating Negroes. It was found that Ss attributed more blame to the frustrators when a white frustrated a Negro than when a Negro frustrated a white. Feelings of anger and direction of anger were not related to race of frustrator. It is suggested that the Negro reactions to white frustration were related to sex, age, and socioeconomic class, and may not, therefore, be applicable to other Negro groups.—*Journal summary.*

8010. Kleiner, Robert J. & Parker, Seymour. (Temple U.) **Social-psychological aspects of migration and mental disorder in a Negro population.** *American Behavioral Scientist*, 1969(Sep), Vol. 13(1), 104-125.—Examines the relationship between migration and mental disorder and attempts to explain differences in

rates of mental disorder between Negroes who migrated from the South to the North and Negroes native to the North, in terms of social mobility, goal-striving behavior, and ethnic or racial identity. Results from interviews using a 206-item questionnaire with a total of 2906 Ss show that northern Negroes had higher rates of mental disorder, higher levels of upward and downward social mobility, more intense goal-striving behavior, and weak or ambivalent attitudes toward their Negro group membership. Based on a demonstration that these characteristics prevail in high illness-yield community population segments, it is concluded that these factors are not simply consequences of mental disorder, but are dynamically involved in its development. (25 ref.).—G. Steele.

8011. Miller, Errol L. **Body image, physical beauty and colour among Jamaican adolescents.** *Social & Economic Studies*, 1969(Mar), Vol. 18(1), 72-89.—Investigated the 475 urban Jamaican 11-15 yr. olds "perceive their bodies and conceive of physical beauty in relationship to their actual skin-colour." Results indicate: (a) a common concept of beauty, (b) no preference for white skin color, (c) "cathexis of their Body Image is determined by the closeness of their actual body features to the Caucasian stereotype generally accepted as being ideal . . ." and (d) the most important body features were those affected by growth or of social significance (racial). It is concluded that the prediction is valid that political and social changes will alter the perception of color within the society.—G. Steele.

8012. Ring, Stephen I. & Schein, Lawrence. (U. Pennsylvania, Medical School) **Attitudes toward mental illness and the use of caretakers in a black community.** *American Journal of Orthopsychiatry*, 1970(Jul), Vol. 40(4), 710-716.—Surveyed mental health attitudes and caretaker utilization with 388 upwardly mobile, lower-middle income black households. The general trend in attitudinal responses was accepting and understanding. Nearly 90% of respondents reported an intention to utilize medical personnel in the event of mental or emotional problems.—*Journal summary*.

8013. Taddei, Maria A. **O problema da interação Judeu-anti-semita: Uma análise do preconceito.** [The problem of interaction between Jew and anti-semita; Analysis of the prejudice.] *Revista de Psicologia Normal e Patológica*, 1969(Jan), Vol. 15(1-2), 111-128.—Discusses the attitudes and characteristics of the ghetto Jew and the antisemite. The real basis of antisemitism is considered to be socioeconomic competition. The social isolation of Jews is thought to serve as a pretext for preconceived attitudes on the part of non-Jews. For Jews, the isolation of a ghetto is thought to provide a rationalization for furthering their status quo and encouraging defense mechanisms, e.g., group valorization. The problem of Jewish segregation is regarded as one which extends beyond the Jews themselves, and involves the entire sociocultural system in which they live. 3 possible solutions are discussed: total voluntary isolation, total integration, or emigration to Israel.—P. Hertzberg.

8014. TenHouten, Warren D. (U. California, Los Angeles) **The black family: Myth and reality.** *Psychiatry, Washington, D.C.*, 1970(May), Vol. 33(2), 145-173.—Examines the stereotype of the white family as patriarchal and the black family as matriarchal, particularly in the ghetto. The Moynihan thesis is that family deterioration in the Negro community explains the

pathology of the Negro community's social relationships to the larger community. The literature is reviewed and the implications of the Moynihan thesis are examined. A study was designed which sampled black and white, lower and higher socioeconomic status families. A list of 9 statements was presented on an agree-disagree spectrum; families were questioned as to who would have the final decision power on 8 important problems; and the children in the family were interviewed regarding their perception of the power relationships, and their perception of the "expressive support" and the "instrumental means" support they could expect from either parent. Although black wives appear to be powerful, so do black husbands. Lower class white husbands tend to be highly dominant in the conjugal role but less so in child socialization. Political reasons are indicated for more controlled studies of the black community, as research can lead to either "control of blacks by whites or as a means of resistance to such control."—E. M. Upchurch.

Social Structure & Social Role

8015. Anant, Santokh S. (U. Lethbridge, Alberta, Canada) **Caste Hindu attitudes toward Harijans: A study of inter-caste and urban-rural differences.** *Psychologia: An International Journal of Psychology in the Orient*, 1970(Mar), Vol. 13(1), 42-56.—From the traditional 4 Varnas, hundreds of subcastes and subsubcastes have evolved. All have elaborate rituals and customs and are cognizant and vigilant about their place in the caste hierarchy. Harijans are the former "Untouchables," considered to be outside the hierarchy. Ss were 577 male Indians randomly drawn from urban and rural areas in 3 locations of northern India. A 50-item multiple-choice questionnaire was individually administered in late spring of 1968. Results indicate more resistance to admission of Harijans into temples than to physical contact. Urban Ss were more liberal than rural Ss on all questions. (18 ref.).—R. D. Nance.

8016. Elder, Glen H. (U. North Carolina) **Appearance and education in marriage mobility.** *American Sociological Review*, 1969(Aug), Vol. 34(4), 519-533.—Investigated the relative influence of attractiveness and educational attainment in marriage mobility in a longitudinal sample of women from middle- and working-class families. Ss were born in the early 1920s, were intensively studied during the 1930s, and most of them participated in at least 1 adult follow-up. During adolescence, middle-class Ss were significantly higher on physical attractiveness, groomed appearance, and IQ than Ss from the working class. The 2 groups did not differ on status aspiration or academic aptitude. Ss who became upwardly mobile through marriage were characterized by physical attractiveness, a desire to impress and control others, high aspirations for the future, and an avoidance of steady dating. Intelligence and academic aptitude were not directly predictive of marriage mobility, although both factors influenced the adult status of the Ss through their educational attainment. Among Ss from the working class, physical attractiveness was more predictive of marriage to a high-status man than educational attainment, while the relative effects of these factors were reversed among Ss of middle-class origin. Social ascent from the working class was also related to sexual restraint and a well-groomed appearance. (40 ref.).—*Journal abstract*.

8017. Kinloch, Graham C. (U. Natal, South Africa)

Social origins, academic achievement, and mobility channels: Sponsored and contest mobility among college graduates. *Social Forces*, 1969(Sep), Vol. 48(1), 36-45.—Investigates the significance of achievement and ascriptive factors in the career mobility of college graduates. Data gathered from a national sample of 150 organizations and 4000 engineers and managers indicate the continued operation of both social origins and academic achievement on the postcollege career. It is clear, however, that there is an independent influence of origins and achievement on these careers. The importance of school-organizational factors is also evident. With the continuing expansion in higher education it remains to be seen whether these influences upon mobility will contribute to a more open class structure or to the emergence of new class-based hurdles. (20 ref.)—*Journal abstract*.

8018. McKinlay, John B. (Aberdeen U., Scotland) **Comment on "Class attitudes to dental treatment."** *British Journal of Sociology*, 1969(Mar), Vol. 20(1), 85-87.—For the following 4 reasons, it is felt that S. Dickson's (see PA, Vol. 42:17069) study did not conclusively demonstrate that the middle class are more dentally conscious and attend the dentist more often than the working class: (a) None of the available direct evidence was adduced to support the crucial assertion of differential use of medical services by different social classes. (b) Dickson's sample selection for his own study was not convincingly representative. (c) General conclusions about Dental Service usage were drawn not from usage behavior, but from attitudes toward a specific kind of usage. (d) Dickson's study constitutes a "research regression" to descriptive investigation while recent studies in the area are now concerned not with further replication of differential usage findings but with determining reasons for such differences.—K. G. Shaver.

Religion

8019. Ali Beg, Moazziz. (Muslim U., Aligarh, India) **The theory of personality in the Bhagavad Gita: A study in transpersonal psychology.** *Psychologia: An International Journal of Psychology in the Orient*, 1970(Mar), Vol. 13(1), 12-17.—Presents a brief outline of a personality theory, and discusses its empirical significance as related to transpersonal psychology. The Gita's personality theory is based on an overall conception of human nature stressing the value of the highest possibilities of human existence. 3 states of existence, Tamas, Rajas, and Sattwa, are described. The first 2 involve a closed action system activated by biological drives. Rajas, however, involves full use of reason. Sattwa stresses transcendental cosmic awareness and bliss. These 3 orientations constitute morality, freedom, health, and adjustment. Adjustment may be either desirable or undesirable. The model of man presented is essentially a human one.—R. D. Nance.

8020. Anzai, Jiro. **Kyoto psychological slightseeing: III.** *Psychologia: An International Journal of Psychology in the Orient*, 1970(Mar), Vol. 13(1), 59-60.—Describes a path which is related to a legend told of Buddha. The reader's "destination" is the Temple of Pure Quiescence founded in 802 AD. A brief history of the temple is given. The panoramic view from the temple includes downtown Kyoto. The "borrowed view" technique is discussed, and the technique is related to Gestalt principles of perception. These principles are said to

describe the ways people naturally perceive.—R. D. Nance.

8021. Arasteh, A. Reza. (U. Teheran, Iran) **Patterns and processes of self-liberation in the Near Eastern Sufism (art of rebirth).** *Psychologia: An International Journal of Psychology in the Orient*, 1970(Mar), Vol. 13(1), 5-11.—The Sufis are Near Eastern mystics who analyze underlying realities of religion and philosophy and unveil man's psyche as a means of attaining perfection and certainty. The real self is the product of the universe in evolution. Cosmic self is contrasted with phenomenal self, the product of culture and environment. The cosmic self must be obtained through experiencing; mere instruction is insufficient. The fully awakened person attains union with all. Having had an image of a better life, he becomes a seeker. The phenomenal self separates us from our origin, union with all of life. The various stages experienced by the Sufi are described. (19 ref.)—R. D. Nance.

8022. Chernyak, V. A. **Formirovanie nauchno-materialisticheskogo ateisticheskogo mirovozreniya.** [Formation of a scientific-materialist atheistic world-view.] Alma-Ata, USSR: Nauka, 1969. 372 p.—Presents the findings of a wide scale study of persistent religiosity under contemporary conditions among workers in Kazakhstan, Russia.—I. D. London.

8023. Dittes, James E. (Yale U., Divinity School) **Pastoral psychology: The next 20 years: In relation to all psychology.** *Pastoral Psychology*, 1970(Feb), Vol. 21(201), 43-49.—Up to now pastoral psychology has been pastoral clinical psychology. In the next 20 yr. pastoral psychology should become much more clear and more than pastoral clinical psychology. It should encourage the pastor to take far more seriously that which is uniquely and decisively his own basis for relationship with his people—his role as a religious and church leader.—O. Strunk.

8024. Klink, Thomas W. (Menninger Foundation, Div. of Religion & Psychiatry, Topeka, Kan.) **The ministry as career and crisis.** *Pastoral Psychology*, 1969(Jun), Vol. 20(195), 13-19.—The ministry as a vocation exists in a network of unwritten "contracts of expectation." As these are understood and clarified, the minister will be in a far better position to carry out his vocation effectively and with a sense of personal fulfillment.—O. Strunk.

8025. Lowe, C. Marshall. (U. California, School of Education, Berkeley) *Pastoral Psychology*, 1969(Oct), Vol. 20(197), 55-59.—Explores how churches are like hospitals and hospitals like churches. Their common elements are a sense of community, a common concern for those most in need of help, and a common aspect involving the way in which healing takes place. Although church and hospital are different in some respects, they are united in their attempt to help the whole man.—O. Strunk.

8026. McGinnis, Thomas C. (Counseling & Psychotherapy Center, Fair Lawn, N.J.) **Clergymen in conflict.** *Pastoral Psychology*, 1969(Oct), Vol. 20(197), 13-20.—Describes some "occupational hazards" of clergymen in regard to the roles society expects clergymen to play; the behavior that is usually an implied part of their profession; the personal and spiritual goals that ministers aspire to; and the potential influences of these often conflicting positions on their family lives. The various divergent expectations of community, parishioners, family, and the minister himself must be

evaluated realistically if he is to function effectively.—O. Strunk.

8027. Mead, Margaret. (American Museum of Natural History, New York, N.Y.) **Pastoral psychology: The next 20 years: As seen by a social scientist.** *Pastoral Psychology*, 1970(Feb), Vol. 21(201), 8-15.—Traces the interrelationships between professional pastors and the social sciences in 4 areas: (a) education and self-knowledge of pastors and the use of this self-knowledge in counseling, (b) increased understanding of the pastors' possible roles and functions within the social structure, (c) broadening the pastors' understanding of and sympathy with different groups in the larger society, and (d) extension of the pastors' own understanding of religious practices as such. The next 2 decades can be devoted, with valuable results, to an increasingly serious concern with religion itself. Bridges between the various disciplines will be provided by many more people who belong to both worlds. (26 ref.)—O. Strunk.

8028. Murphy, Carol. (Society of Friends, Swarthmore, Pa.) **Faith and experiment.** *Pastoral Psychology*, 1969(Jun), Vol. 20(195), 9-12.—Discusses the contemporary belief that both science and theology have deeply personal dimensions and that it is no longer possible to think of objective science opposed to subjective religious faith. Truth is more a personal and unconditional summons, answered by scientist and religionist in his own way.—O. Strunk.

8029. Oates, Wayne E. (Southern Baptist Theological Seminary, Louisville, Ky.) **Pastoral psychology: The next 20 years: In relation to theological education.** *Pastoral Psychology*, 1970(Feb), Vol. 21(201), 49-55.—Needed changes in the future of pastoral psychology and theological education include moving from medical to field theory models, from individualistic to social psychology, a new emphasis on pastoral research, interdisciplinary education in theology, and more aggressive stances in pastoral care and counseling.—O. Strunk.

8030. Pantskhav, I. D. (Ed.) **Konkretno-sotsiologicheskoe izuchenie sostoyaniya religioznosti i opyta ateisticheskogo vospitaniya.** [Empirico-sociological study of the state of religiosity and atheistic training.] Moscow, USSR: Moscow U., 1969. 283 p.—Presents a collection of 14 articles, representing some of the findings of field studies conducted in Orenburg Province (1962), Krasnodar Region (1963), Orlov Province (1965), the Lenin District of Moscow (1966), as well as in Central Asia, Western Ukraine, Belorussia, etc. (1966-1968). A criticism of the research methods utilized in the "American psychology of religion" is included.—I. D. London.

8031. Sato, Koji. (Otemongakuin U., Japan) **Zen, Tendai Sen and Naikan.** *Psychologia: An International Journal of Psychology in the Orient*, 1970(Mar), Vol. 13(1), 2-4.—Lists various representatives of the varieties of Japanese Buddhism. The case of a teacher-priest who studied the Naikan method is described. Changes in his personality are indicated including an apparently successful abstention from liquor. Naikan is felt, in some respects, to be superior to Zen. Zen is also compared with Tendai Zen, the latter being more complex. It is suggested that all 3, plus other approaches, should be integrated into the psychologist's training.—R. D. Nance.

8032. Shaw, Blair W. (Ontario Inst. for Studies in Education, Toronto, Canada) **Religion and conceptual**

models of behaviour. *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 320-327.—Studied the relationships between a number of religious variables (e.g., denominational affiliation, devoutness, and "intrinsicness") and the ways in which people tend to perceive and respond to the behavior of others in an experiment with 170 undergraduates. The latter variable was measured by use of the Beliefs About Behaviour Inventory which assesses the relative extent to which a person uses each of 3 conceptual models of behavior: theological, illness, and psychological. These models were selected for measurement because of their significance historically and in contemporary debates. Results indicate that Ss who were fundamentalist, devout, or indiscriminately proreligious were significantly lower in the use of a psychological approach to conceptualizing behavior and, conversely, Ss who are not characterized by these religious dimensions are more prone to use a psychological approach and to reject a theological conceptualization of human behavior. (20 ref.)—Journal abstract.

8033. Stinnette, Charles R. (U. Chicago, Divinity School) **Pastoral psychology: The next 20 years: In relation to social action.** *Pastoral Psychology*, 1970(Feb), Vol. 21(201), 68-80.—Explores the characteristics and requirements of an "honest method," especially in regard to the relation between pastoral psychology and social action. The concept of action research is considered as a sound method of social inquiry and a way of hoping.—O. Strunk.

Cross Cultural Comparison

8034. Butler, John R. (U. Kent, Centre for Research in Social Sciences, Canterbury, England) **Illness and the sick role: An evaluation in three communities.** *British Journal of Sociology*, 1970(Sep), Vol. 21(3), 241-261.—Identical household interview surveys were conducted in communities in America, Britain, and Yugoslavia to test the hypothesis derived from Parsons' theory of illness that there would be differential tolerance of illness between these differing cultures. Within each community interviewers recruited and comparably trained specifically for this survey interviewed all noninstitutionalized members of the systematically selected households. Results showed that: (a) between 1/3 and 1/2 of the respondents in each area whose activities had been limited failed to seek medical care, (b) professional care was sought primarily for more "serious" complaints, and (c) persons defined as ill on action criteria generally constituted a minor portion of all those either seeking professional care or reporting complaints that caused serious bother. It is suggested that inadequacies in the Parsonian analysis of illness derive from a failure to consider personality, organismic, and cultural components of action theory. It is concluded that the deviancy assumed by "the sick role" in fact is a subtle complex of roles and expectations such that true deviancy is associated with withdrawal from social participation inappropriate to the extent of illness. (3 p. ref.)—K. G. Shaver.

8035. Cameron, Paul & Robertson, Donald. (U. Evansville, Indiana) **Comparison of the cultural values of Scot and U.S. children.** *International Journal of Psychology*, 1970, Vol. 5(2), 135-139.—1189 Scottish Ss and 1268 United States Ss ranging in age from 10-18 yr.

ranked 27 value items on a Likert-type scale and indicated in an open-ended scale the 2 most important things in life. Similarities appeared much more marked than dissimilarities, with no differences appearing on the structured questionnaire and few on the open-ended part. No sex differences on the open-ended questionnaire approached the .001 level, and about 75% of the responses in both countries fell into mutual heavily valued categories. United States Ss tended to value education, family relationships, and self-actualization relatively more than their Scottish peers, while Scots valued career, happiness-fun, health, and satisfaction of biological imperatives more. (French abstract)—S. E. Gavin.

8036. Dixon, Paul W., Fukuda, Nobuko K., & Berens, Anne E. (U. Hawaii, Hilo) **Cognitive and personalogical factor patterns for Japanese-American high-school students in Hawaii.** *Psychologia: An International Journal of Psychology in the Orient*, 1970(Mar), Vol. 13(1), 35-41.—One may associate differences in personality type among Sansei Japanese with time of immigration from their homeland. The study investigated sex differences in need hierarchy as shown on the EPPS, teachers' ratings of classroom behavior, and cognitive abilities as measured by the School and College Abilities Test. Ss were 166 members of the graduating class of a large high school in Hawaii, 107 of whom were Japanese. An oblique rotation derived factor patterns. 1 emerged for males and 2 for females. A teachers' rating scale is included. (22 ref.)—R. D. Nance.

8037. El-Abd, Hamed A. (Makerere University Coll., Kampala, Uganda) **The Intellect of East African students.** *Multivariate Behavioral Research*, 1970(Oct), Vol. 5(4), 423-433.—Describes an experiment confirming earlier findings by H. A. El-Abd that the East African students' structure of mental abilities is no different from that of students in the West. 7 factors were chosen, each being represented by 2 Western reference tests. These factors were flexibility of closure, spatial orientation, visual cognition, numerical facility, symbolic identification, verbal comprehension, and word fluency. The battery was administered to 104 Higher School Certificate boys and 155 university undergraduates. Principal components analysis was followed by orthogonal rotation using the varimax solution. The 7 factors were identifiable in both samples, tending to confirm the original study findings. (19 ref.)—*Journal abstract*.

8038. Ghiglione, Rodolphe & Beauvois, Jean L. (U. Paris, Vincennes, France) **Perception de soi et perception d'autrui chez les adolescents: Enquête en France et en Grèce.** [Self-perception and perception of others by adolescents: Investigation in France and in Greece.] *International Journal of Psychology*, 1970, Vol. 5(2), 123-133.—1000 14-18 yr. old Ss, from Paris, an outlying province in France, and Athens checked traits they believed applied to young men, young girls, adult men, and adult women. A complementary interview procedure involving volunteers followed. French adolescents revealed a desire to be different from adults, and Greek adolescents, a desire to be similar to adults. Sex differences in perception of French Ss consisted in the tendency of young men to be perceived as affirming themselves, and of young women as maintaining dependence upon men. No corresponding sex comparison could be made for the all-male Greek sample. Differences in perception for Ss from 2 nations support a cultural origins hypothesis. The study leads to questions

concerning the degree to which stereotypes affect behavior.—S. E. Gavin.

8039. Green, R. T. & Santori, G. (University Coll., London, England) **A cross cultural study of hostility and aggression.** *Journal of Peace Research*, 1969, No. 1, 13-22.—Conducted a cross-cultural study of hostility and aggression using a 60-item questionnaire. 117 English-speaking and 71 Italian urban middle-class Ss did not differ greatly on their overall level and general scoring patterns, but the differing norms of the 2 societies were reflected. Results for the item analysis for the 2 samples were generally in line with 1 another; hostility and aggression would, therefore, appear to share a similar, though not identical, conceptual framework in the 2 cultures. It is suggested that, although there is some truth in national stereotypes, and comparisons of cultural patterns of hostility/aggression may be fruitful, definitive statements are essentially meaningless since no objective criterion exists. A copy of the questionnaire is included. (Russian summary) (23 ref.)—*Journal summary*.

8040. Hare, A. Paul & Peabody, Dean. (Haverford Coll.) **Attitude content and agreement set in autonomy-authoritarianism items for United States, African, and Philippine university students.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 23-31.—Used cross-cultural data, including sets of autonomy and authoritarian items, to reexamine the importance of attitude content and agreement set in such items. Consistent results in this and other studies—the means, variability, reliability, and correlations for the 2 types of items—suggest that content and set are normally both important components of the scores. External correlates of such scales may relate to either content or set. The social background characteristics of these cross-cultural samples seem more related to content. (17 ref.)—*Journal summary*.

8041. Miller, M. J., Brehmer, B., & Hammond, K. R. (U. Colorado) **Communication and conflict reduction: A cross-cultural study.** *International Journal of Psychology*, 1970, Vol. 5(2), 75-87.—Undergraduate Ss from Sweden and the United States experienced pre-training, in 2 independently conducted studies, leading to conflicting systems of belief for paired Ss. Next the differently-trained members who made up each pair encountered a new but similar situation in which some pairs received full communication, others factual communication, still others no feedback concerning performance on the conflict task. $\frac{1}{2}$ the Ss in the no communication group received the correct answer following each of 20 trials; the other $\frac{1}{2}$ did not. Ss showed less conflict and greater conflict reduction under full communication than under no communication, with factual communication falling in between. Results yield no cross-cultural differences. Outcome feedback shows no effect upon conflict reduction. Information about the nature of the belief system of other persons appears to be essential to conflict reduction. (French abstract)—S. E. Gavin.

8042. Wiberg, J. Lawrence & Blom, Gaston E. (U. Colorado, Denver) **Cross-national study of attitude content in reading primers.** *International Journal of Psychology*, 1970, Vol. 5(2), 109-122.—Quantitative analysis of content of American primers has shown great discrepancies between the actual lives of children and story content. This result, presumably related to reading disability, stimulated cross-national study of primer

content. Preliminary analysis of 60 randomly selected stories from primers of the United States, South Korea, England, West Germany, and Russia reveal 17 of 38 attitudes that appear discriminated at a statistically significant level. Systematic investigation of attitudinal content in primers could provide information important for determining differences or similarities between societies in stereotypes, moral systems, and child rearing. (French abstract)—*S. E. Gavin.*

Family

8043. Aldous, Joan. (U. Minnesota) **Occupational characteristics and males' role performance in the family.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 707-712.—Discusses the literature linking men's occupational activities to their performance of marital and parental roles. The usual dichotomization of occupational and family role demands is questioned. The economic resources that certain occupations give a man, which supply the minimum essentials for his functioning in the family, are discussed. An analysis is also made of how the right kind of occupation can facilitate communication skills needed for marital interaction. Also occupational characteristics, e.g., job salience, the synchronization of its demands with those of the family, and the overlap in personal and ecological location between family and work settings all affect intrafamily dynamics.—*Journal abstract.*

8044. Aug, Robert G. & Bright, Thomas P. (U. Kentucky, Medical Center, Div. of Child Psychiatry) **A study of wed and unwed motherhood in adolescents and young adults.** *Journal of the American Academy of Child Psychiatry*, 1970(Oct), Vol. 9(4), 577-594.—Conducted psychological interviews 24-48 hr. postpartum with 24 unmarried and 22 married mothers in an obstetrical clinic serving primarily low socioeconomic rural whites and urban Negroes in the Appalachian area of Kentucky. Results based on global impressions show that most Ss fit into 1 of 4 groups which cut across distinctions of married vs. unmarried and white vs. black. The characteristics of each group are summarized and an illustrative case is presented for each. Based on findings, certain widely held views on out-of-wedlock pregnancy are reexamined regarding: (a) understanding unwed motherhood in terms of pathology, as opposed to normal psychosocial development; (b) tendencies toward overgeneralization of similarities and differences within patient populations; and (c) current views of prevention of recurrence of illegitimate pregnancy.—*M. Maney.*

8045. Grey, Alan L. (Ed.) (Fordham U., Graduate School of Arts & Sciences) **Man, woman, and marriage: Small group process in the family.** New York, N.Y.: Atherton, 1970. 225 p.

8046. Howells, J. G. (Inst. of Family Psychiatry, Ipswich & East Suffolk Hosp., England) **Fallacies in child care: II. That fathering is unimportant.** *Acta Paedopsychiatrica*, 1970(Feb), Vol. 37(2-3), 46-55.—With the emphasis on mothering, fathering has been neglected in Western culture. Both in the zoological sphere and in some human cultures, fathering takes on added importance and, except for producing and nursing the young, the mother takes a minor role. Fathering is not a poor substitute for mothering, but an element of family group life of equal significance. Father influence must be

evaluated in the clinical exploration like any other element.—*G. Rubin-Rabson.*

8047. Jacoby, Arthur P. (U. North Dakota) **Transition to parenthood: A reassessment.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 720-727.—Suggests fresh theoretical, conceptual, and methodological perspectives for research on the transition to parenthood. Several parenthood as a crisis studies are reviewed, including 1 significant but unpublished investigation. Possible explanations for the discrepancy in published crisis scores are offered. In this context, the relationship of social class to ease of assuming the parenthood role is explored. Morris Freilich's concept of the "natural triad" is shown as a potentially useful theoretical approach to understanding parenthood. It is suggested that future research on the adjustment of parents to their children include (a) a distinction between objective behavioral changes required by parenthood and their subjective interpretation; (b) reliable instruments for measuring the rewards and difficulties of parenthood; (c) larger and more representative samples; and (d) identification of variables related to the ease of transition to parenthood.—*Journal abstract.*

8048. Kaplan, Howard B. (Baylor Coll. of Medicine, Texas Medical Center, Houston) **Self-derogation and childhood family structure: Family size, birth order, and sex distribution.** *Journal of Nervous & Mental Disease*, 1970(Jul), Vol. 151(1), 13-23.—Conducted a survey of a representative sample (N = 500) of the adult population of a highly populated county in Texas to determine the relationship between family characteristics and self-derogation scores. Significant relationships were observed between adult self-derogation and the number (odd vs. even) of siblings, birth order, and sex distribution of children. No relationship between self-derogation and only child status or family size was noted. Interaction effects of childhood family structure and S characteristics (sex, race, social class, rural-urban origins) are noted. Discussion of related literature is included. (32 ref.)—*Journal abstract.*

8049. King, Karl. (U. Georgia) **Adolescent perception of power structure in the Negro family.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 751-755.—Assessed the perception of 226 adolescent Negro males and 313 females concerning the power structure within the Negro family. Ss were divided by the father's occupation into 3 levels: white collar, blue collar, and unskilled. Results indicate that both male and female Ss viewed the power structure to be mainly syncretic. Males reported stronger father participation than did females, and females reported stronger mother participation than did males. Both males and females indicated stronger father participation in decision-making than has been historically presented.—*Journal abstract.*

8050. Marwell, Gerald & Schmitt, David R. (U. Wisconsin) **Child-rearing experience and attitudes toward the use of influence techniques.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 779-782.—426 unmarried female undergraduates and 136 married women with children completed questionnaires indicating the likelihood of their performing 16 types of influence techniques in a common child-rearing situation. Results indicate that at least 2/3 of respondents in both groups preferred techniques which involved either the recognition of contingencies or positive appeals to emotions, and pictured themselves as not using promises even when such a technique might work. Responses of

the undergraduates and the mothers differed significantly ($p < .05$) on 7 of the techniques. Mothers were more likely to use positive than negative love-oriented techniques, and to use almost all active techniques, including threat, liking, pregiving, and aversive stimulation. Results are interpreted as suggesting that the experience of child-rearing may produce significant changes in attitudes toward parental influence techniques.—*Journal abstract.*

8051. Pohlman, Edward. (U. Pacific, School of Education) **Childlessness, intentional and unintentional: Psychological and social aspects.** *Journal of Nervous & Mental Disease*, 1970(Jul), Vol. 151(1), 2-12.—Discusses the psychosocial causes and effects of childlessness, comparing them to the situation of those who want children but cannot have them and to those who by remaining unmarried, postpone childbearing. The psychological difference between 0 and 1 child is much greater than that between 1 and 2 children. In Western countries today, a child typically makes more difference in adults' lives than marriage. Not over 1 or 2% of contemporary marriages in the United States remain intentionally childless, but in depression times the picture was different. Possibilities for promoting childlessness to reduce population growth are stressed. (24 ref.)—*Journal abstract.*

8052. Seidenberg, Robert. (State U. New York, Upstate Medical Center, Syracuse) **Marriage in life and literature.** New York, N. Y.: Philosophical Library, 1970. ix, 307 p. \$5.95.

8053. Smith, David H. & Sternfield, James. (Haight-Ashbury Medical Clinic, San Francisco, Calif.) **The hippie communal movement: Effects of child birth and development.** *American Journal of Orthopsychiatry*, 1970(Apr), Vol. 40(3), 527-530.—Presents initial findings of the Haight-Ashbury Clinic's commune research group, emphasizing "the effect of the communal life style on childbirth and child development." The most significant characteristic of the commune was "the desire to return to natural, almost primitive techniques of childbirth." Babies were breast fed as long as possible. "The most happy, successful communes had a parental schooling organization which stressed music, folk arts and crafts, and practiced outdoor and domestic skills." It is speculated that "the children of psychedelic communes may... rebel against the psychedelic philosophy and go straight," as have some of the children in Israeli kibbutzim. The average city commune size ranged from 4-20 adults, while country communes averaged about 50.—*M. West.*

8054. Stolka, Susan M. & Barnett, Larry D. (Arizona State U.) **Education and religion as factors in women's attitudes motivating childbearing.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 740-750.—Administered a questionnaire measuring 4 attitudes which motivate having children to 462 women 18 yr. of age and over. Multivariate analysis was used to ascertain the existence of a causal influence of educational level and religion on attitudes. Religion appeared to have a direct causal relationship with 2 of the attitudes among women having up to 12 yr. of schooling and under \$4000 income who attended church every week. Protestants accepted these attitudes less than Catholics. The 1 most strongly accepted attitude was that a woman's main responsibility in life and her social duty is to bear children.—*Journal abstract.*

8060. Boesel, David. (Johns Hopkins U.) **The liberal society, black youths, and the ghetto riots.** *Psychiatry, Washington, D.C.*, 1970(May), Vol. 33(2), 265-281.—Analyzes the political and economic background which has led to recent riots. Higher educational levels and unemployment rates among young blacks is noted, as well as their favoring of violence as a political tactic. Events are documented leading to the 1966 riot in Plainfield, New Jersey. It is shown that legitimate processes had been followed and politicians had ignored the grievances of black youth. (15 ref.)—*E. M. Uprichard.*

8061. Crawford, Thomas J. & Naditch, Murray. (U. California, Berkeley) **Relative deprivation, powerlessness, and militancy: The psychology of social protest.** *Psychiatry, Washington, D.C.*, 1970(May), Vol. 33(2), 208-223.—Reviews the theory of relative deprivation and reports on a survey measuring militancy in conjunction with feelings of high vs. low discrepancy in an individual's distance from his ideal life style. Data tend to support the view that a large difference between "want" and "get" leads to political militancy. Individual perception of life control being internal (in his own hands) vs. external ("fated") are measured. Willingness to use violence is lowest with persons who feel a low life style discrepancy and internal control, and highest in persons who feel a high discrepancy and external control. It is concluded that "the psychology of social change must consider perceived means as well as subjective goals, efficacy as well as relative deprivation."—*E. M. Uprichard.*

content. Preliminary analysis of 60 randomly selected stories from primers of the United States, South Korea, England, West Germany, and Russia reveal 17 of 38 attitudes that appear discriminated at a statistically significant level. Systematic investigation of attitudinal content in primers could provide information important for determining differences or similarities between societies in stereotypes, moral systems, and child rearing. (French abstract)—S. E. Gavin.

Family

8043. Aldous, Joan. (U. Minnesota) **Occupational characteristics and males' role performance in the family.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 707-712.—Discusses the literature linking men's occupational activities to their performance of marital and parental roles. The usual dichotomization of occupational and family role demands is questioned. The economic resources that certain occupations give a man, which supply the minimum essentials for his functioning in the family, are discussed. An analysis is also made of how the right kind of occupation can facilitate communication skills needed for marital interaction. Also occupational characteristics, e.g., job salience, the synchronization of its demands with those of the family, and the overlap in personal and ecological location between family and work settings all affect intrafamily dynamics.—*Journal abstract.*

8044. Aug, Robert G. & Bright, Thomas P. (U. Kentucky, Medical Center, Div. of Child Psychiatry) **A study of wed and unwed motherhood in adolescents and young adults.** *Journal of the American Academy of Child Psychiatry*, 1970(Oct), Vol. 9(4), 577-594.—Conducted psychological interviews 24-48 hr. postpartum with 24 unmarried and 22 married mothers in an obstetrical clinic serving primarily low socioeconomic rural whites and urban Negroes in the Appalachian area of Kentucky. Results based on global impressions show that most Ss fit into 1 of 4 groups which cut across distinctions of married vs. unmarried and white vs. black. The characteristics of each group are summarized and an illustrative case is presented for each. Based on findings, certain widely held views on out-of-wedlock pregnancy are reexamined regarding: (a) understanding unwed motherhood in terms of pathology, as opposed to normal psychosocial development; (b) tendencies toward overgeneralization of similarities and differences within patient populations; and (c) current views of prevention of recurrence of illegitimate pregnancy.—M. Maney.

8045. Grey, Alan L. (Ed.) (Fordham U., Graduate School of Arts & Sciences) **Man, woman, and marriage: Small group process in the family.** New York, N.Y.: Atherton, 1970. 225 p.

8046. Howells, J. G. (Inst. of Family Psychiatry, Ipswich & East Suffolk Hosp., England) **Fallacies in child care: II. That fathering is unimportant.** *Acta Paedopsychiatrica*, 1970(Feb), Vol. 37(2-3), 46-55.—With the emphasis on mothering, fathering has been neglected in Western culture. Both in the zoological sphere and in some human cultures, fathering takes on added importance and, except for producing and nursing the young, the mother takes a minor role. Fathering is not a poor substitute for mothering, but an element of family group life of equal significance. Father influence must be

evaluated in the clinical exploration like any other element.—G. Rubin-Rabson.

8047. Jacoby, Arthur P. (U. North Dakota) **Transition to parenthood: A reassessment.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 720-727.—Suggests fresh theoretical, conceptual, and methodological perspectives for research on the transition to parenthood. Several parenthood as a crisis studies are reviewed, including 1 significant but unpublished investigation. Possible explanations for the discrepancy in published crisis scores are offered. In this context, the relationship of social class to ease of assuming the parenthood role is explored. Morris Freilich's concept of the "natural triad" is shown as a potentially useful theoretical approach to understanding parenthood. It is suggested that future research on the adjustment of parents to their children include (a) a distinction between objective behavioral changes required by parenthood and their subjective interpretation; (b) reliable instruments for measuring the rewards and difficulties of parenthood; (c) larger and more representative samples; and (d) identification of variables related to the ease of transition to parenthood.—*Journal abstract.*

8048. Kaplan, Howard B. (Baylor Coll. of Medicine, Texas Medical Center, Houston) **Self-derogation and childhood family structure: Family size, birth order, and sex distribution.** *Journal of Nervous & Mental Disease*, 1970(Jul), Vol. 151(1), 13-23.—Conducted a survey of a representative sample (N = 500) of the adult population of a highly populated county in Texas to determine the relationship between family characteristics and self-derogation scores. Significant relationships were observed between adult self-derogation and the number (odd vs. even) of siblings, birth order, and sex distribution of children. No relationship between self-derogation and only child status or family size was noted. Interaction effects of childhood family structure and S characteristics (sex, race, social class, rural-urban origins) are noted. Discussion of related literature is included. (32 ref.)—*Journal abstract.*

8049. King, Karl. (U. Georgia) **Adolescent perception of power structure in the Negro family.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 751-755.—Assessed the perception of 226 adolescent Negro males and 313 females concerning the power structure within the Negro family. Ss were divided by the father's occupation into 3 levels: white collar, blue collar, and unskilled. Results indicate that both male and female Ss viewed the power structure to be mainly syncratic. Males reported stronger father participation than did females, and females reported stronger mother participation than did males. Both males and females indicated stronger father participation in decision-making than has been historically presented.—*Journal abstract.*

8050. Marwell, Gerald & Schmitt, David R. (U. Wisconsin) **Child-rearing experience and attitudes toward the use of influence techniques.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 779-782.—426 unmarried female undergraduates and 136 married women with children completed questionnaires indicating the likelihood of their performing 16 types of influence techniques in a common child-rearing situation. Results indicate that at least $\frac{2}{3}$ of respondents in both groups preferred techniques which involved either the recognition of contingencies or positive appeals to emotions, and pictured themselves as not using promises even when such a technique might work. Responses of

the undergraduates and the mothers differed significantly ($p < .05$) on 7 of the techniques. Mothers were more likely to use positive than negative love-oriented techniques, and to use almost all active techniques, including threat, liking, pregiving, and aversive stimulation. Results are interpreted as suggesting that the experience of child-rearing may produce significant changes in attitudes toward parental influence techniques.—*Journal abstract.*

8051. Pohlman, Edward. (U. Pacific, School of Education) **Childlessness, intentional and unintentional: Psychological and social aspects.** *Journal of Nervous & Mental Disease*, 1970(Jul), Vol. 151(1), 2-12.—Discusses the psychosocial causes and effects of childlessness, comparing them to the situation of those who want children but cannot have them and to those who by remaining unmarried, postpone childbearing. The psychological difference between 0 and 1 child is much greater than that between 1 and 2 children. In Western countries today, a child typically makes more difference in adults' lives than marriage. Not over 1 or 2% of contemporary marriages in the United States remain intentionally childless, but in depression times the picture was different. Possibilities for promoting childlessness to reduce population growth are stressed. (24 ref.)—*Journal abstract.*

8052. Seidenberg, Robert. (State U. New York, Upstate Medical Center, Syracuse) **Marriage in life and literature.** New York, N. Y.: Philosophical Library, 1970. ix, 307 p. \$5.95.

8053. Smith, David H. & Sternfield, James. (Haight-Ashbury Medical Clinic, San Francisco, Calif.) **The hippie communal movement: Effects of child birth and development.** *American Journal of Orthopsychiatry*, 1970(Apr), Vol. 40(3), 527-530.—Presents initial findings of the Haight-Ashbury Clinic's commune research group, emphasizing "the effect of the communal life style on childbirth and child development." The most significant characteristic of the commune was "the desire to return to natural, almost primitive techniques of childbirth." Babies were breast fed as long as possible. "The most happy, successful communes had a parental schooling organization which stressed music, folk arts and crafts, and practiced outdoor and domestic skills." It is speculated that "the children of psychedelic communes may ... rebel against the psychedelic philosophy and go straight," as have some of the children in Israeli kibbutzim. The average city commune size ranged from 4-20 adults, while country communes averaged about 50.—*M. West.*

8054. Stolka, Susan M. & Barnett, Larry D. (Arizona State U.) **Education and religion as factors in women's attitudes motivating childbearing.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 740-750.—Administered a questionnaire measuring 4 attitudes which motivate having children to 462 women 18 yr. of age and over. Multivariate analysis was used to ascertain the existence of a causal influence of educational level and religion on attitudes. Religion appeared to have a direct causal relationship with 2 of the attitudes among women having up to 12 yr. of schooling and under \$4000 income who attended church every week. Protestants accepted these attitudes less than Catholics. The 1 most strongly accepted attitude was that a woman's main responsibility in life and her social duty is to bear children.—*Journal abstract.*

8059. Bloomberg, Warner & Schmandt, Henry J. (Eds.) (U. Wisconsin) **Urban poverty: Its social and political dimensions.** Beverly Hills, Calif.: Sage, 1970. 398 p. \$4.95(paper).

8060. Boesel, David. (Johns Hopkins U.) **The liberal society, black youths, and the ghetto riots.** *Psychiatry, Washington, D.C.*, 1970(May), Vol. 33(2), 265-281.—Analyzes the political and economic background which has led to recent riots. Higher educational levels and unemployment rates among young blacks is noted, as well as their favoring of violence as a political tactic. Events are documented leading to the 1966 riot in Plainfield, New Jersey. It is shown that legitimate processes had been followed and politicians had ignored the grievances of black youth. (15 ref.)—*E. M. Uprichard.*

8061. Crawford, Thomas J. & Naditch, Murray. (U. California, Berkeley) **Relative deprivation, powerlessness, and militancy: The psychology of social protest.** *Psychiatry, Washington, D.C.*, 1970(May), Vol. 33(2), 208-223.—Reviews the theory of relative deprivation and reports on a survey measuring militancy in conjunction with feelings of high vs. low discrepancy in an individual's distance from his ideal life style. Data tend to support the view that a large difference between "want" and "get" leads to political militancy. Individual perception of life control being internal (in his own hands) vs. external ("fated") are measured. Willingness to use violence is lowest with persons who feel a low life style discrepancy and internal control, and highest in persons who feel a high discrepancy and external control. It is concluded that "the psychology of social change must consider perceived means as well as subjective goals, efficacy as well as relative deprivation."—*E. M. Uprichard.*

8062. Goble, Frank. (Thomas Jefferson Research Center, Pasadena, Calif.) **Return to responsibility: An analysis of social problems and a proposal for action.** Pasadena, Calif.: Thomas Jefferson Research Center, 1969. 46 p. \$1.50(paper).

8063. Goldstein, Joseph. (Yale U.) **On the function of criminal law in riot control.** *Psychoanalytic Study of the Child*, 1969, Vol. 24, 463-487.

8064. Jeffery, C. Ray. (Florida State U.) **Social change and criminal law.** *American Behavioral Scientist*, 1970(Mar), Vol. 13(4), 523-534.—Reviews historical developments in criminal law and hypothesizes that the "weakness of criminal law as a means of social control is a reflection of the deterioration of the informal controls

and the inability of the criminal law to operate effectively in a complex urban setting." The progression of criminal law "from social control via punishment and deterrence to social control via rehabilitation and the study of the traits of individual criminals," is described, and the faults of these approaches are discussed. It is concluded that an adequate model of crime control must: (a) prevent crime before it occurs, not deal with it after it has occurred; (b) establish direct rather than indirect controls over criminal behavior; and (c) change the environment in which crimes occur. (53 ref.)—G. Steele.

8065. Kelman, Herbert C. (Harvard U.) **A social-psychological model of political legitimacy and its relevance to black and white student protest movements.** *Psychiatry, Washington, D.C.*, 1970(May), Vol. 33(2), 224-246.—"Black militants, draft resisters, student protestors, and liberated women all deny the legitimacy of the authority exercised by those who make demands upon them and thus feel under no obligation to meet these demands." Reasons for this include system value failures embodied in the Vietnam war, poverty in an overfed nation, and denial of a place in the system to blacks. It is asserted that the trust in national leaders has eroded because of governmental lies and political assassinations ("to place trust in a leader seemed to have become tantamount to imposing a death sentence on him"). Youth today has been raised to question traditional attitudes. This has broken down old beliefs in the legitimacy of traditional authority personified in black and white student movements. A paradigm of perceived legitimacy is presented based on slowing of system values, participation in system roles, and adherence to authoritative norms. The differences between black and white student movements are analyzed in terms of this paradigm.—E. M. Uprichard.

8066. Tomlinson, T. M. (Office of Economic Opportunity, Washington, D.C.) **Determinants of black politics: Riots and the growth of militancy.** *Psychiatry, Washington, D.C.*, 1970(May), Vol. 33(2), 247-264.—Reviews the rise of black militancy since the 1950s. A random sample of 586 blacks living in the riot area of South Central Los Angeles, California were interviewed following that riot. Militancy was defined as a positive attitude toward the Black Muslims (the most militant group visible at the time). Conservatives were defined by a negative attitude toward the Muslims. An uncommitted group was neutral. Federal, state, and local government was viewed with less enthusiasm by militants, as were the President and the state governor. Ss were more likely to endorse civil rights activity short of violence. The uncommitted were least well informed and seemed to be the "silent minority" of the black community. (18 ref.)—E. M. Uprichard.

8067. Tripodi, Tony; Epstein, Irwin, & MacMurray, Carol. (U. Michigan, School of Social Work) **Dilemmas in evaluation: Implications for administrators of social action programs.** *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 850-857.—Suggests 4 basic questions that administrators of social action programs should consider in making decisions about program evaluation: evaluation for what, for whom, by whom, and at what cost? A notion of differential evaluation for different stages of program development is introduced. (36 ref.)—*Journal abstract.*

8068. Weingart, Peter. (Inst. of the Economic Sciences of the Trade Unions, Düsseldorf, W. Germany)

Beyond Parsons? A critique of Ralf Dahrendorf's conflict theory. *Social Forces*, 1969(Dec), Vol. 48(2), 151-165.—R. Dahrendorf attempts to synthesize the Marxian concepts of class, class interests, and class conflict, and the methodology and concepts of the modern theory of action in his analysis of social conflict and change. Authority appears as the focus of social conflicts and plays a dual role in social structures, as both an integrative force and a source of conflict. In each social structure there are 2 classes, rulers and ruled, whose conflicting interests are defined in terms of role expectations. In trying to account theoretically for the occurrence—in the same social structure—of both obedience and conflict, Dahrendorf is forced to resort to a voluntaristic explanation of conflict and change. Likewise his promise to provide a concept of change which transcends given structures, in the Marxian sense cannot be fulfilled. His explanation of change turns out to be identical with that of social mobility. The synthesis between Marx and Parsons fails. (29 ref.)—*Journal abstract.*

8069. Zimbardo, Philip G. (Stanford U.) **The human choice: Individuation, reason, and order versus deindividuation, impulse, and chaos.** *Nebraska Symposium on Motivation*, 1969, Vol. 17, 237-307.—While psychologists "were demonstrating in the laboratory the remarkably fine degree of control which man had at his disposal, all hell was breaking loose outside in the real world." Recent evidence regarding self-destruction, the destruction of others, riots, mob violence, the diminution in the value of life, and the loss of control of behavior is presented. Research evidence relating anonymity to aggression, car smashing, vandalism, and other violent acts is also presented. The "releaser cues" required to initiate destructive vandalism in various cities such as New York and Palo Alto are compared. Anonymity, deindividuation, dehumanization, and control (or the lack of it) are the key words. "In the eternal struggle between order and chaos, we openly hope for individuation to triumph, but secretly plot mutiny with the forces within, drawn by the irresistible lure of deindividuation." (26 ref.)—J. M. Roberts.

SEXUAL BEHAVIOR

8070. Berman, Myron. (Temple Beth-El, Richmond, Va.) **Sex and the Jewish teenager.** *Religious Education*, 1970, Vol. 65(5), 415-421.—Sex-with-affection among the middle classes, constituting the sexual revolution, is less evident among Jews than among Catholics and Protestants, but shows signs of increasing. Stability of the family has served as the common denominator of sexual behavior for Jews, coupled with the elevated status of women. Sex education should include: physiological factors, interpersonal relations, preparation for marriage, sociological considerations, and formulating a standard of values. Girls in a sex education class posed almost 3 times as many questions as boys. Girls' inquiries, in descending order, related to female physiology and the birth process, social implications of sexual behavior, petting, social-sexual behavior, male physiology, intercourse, and contraception. Boys' lesser concern over interpersonal relations suggests continued existence of a double standard with respect to sex. Avoiding puritanism and irrelevancy, future programs can construct a bridge for understanding sex within a total philosophy of life.—S. E. Gavin.

8071. **Hartley, Shirley F.** (California State Coll., Hayward) **The decline of illegitimacy in Japan.** *Social Problems*, 1970(Sum), Vol. 18(1), 78-91.—Although it is typical to examine deviance in social situations where it looms relatively large or is on the increase, it is possible to learn a great deal from negative case studies, as well. In Japan although concubinage had been, historically, a recognized contractual arrangement and births out of wedlock were recorded as 8.8% of the total in 1900, illegitimacy has been declining throughout the 20th century to the point of virtual disappearance. From 1940-1964: (a) the ratio, or percentage, of all illegitimate births declined by 75%; (b) the general illegitimate fertility rate dropped by 88%; and (c) the number of births out of wedlock was reduced by 80%. The demographic and sociological factors related to the decline are examined for clues unique to Japan and/or applicable to societies in general.—S. L. Warren.

8072. **Pope, Hallowell.** (U. Iowa) **Negro-white differences in decisions regarding illegitimate children.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 756-764.—Collected data from 254 Negro and 314 white unwed mothers (primiparas only) chosen from birth certificate information for a 1-yr period. Respondents were interviewed 6 mo.-2½ yr. after the illegitimate birth. The completed cases represent 32% of the white and 65% of Negro cases sampled. Present marital status of the mothers was categorized and discussed. Other findings were that the Negro woman more often than the white woman kept her child (95% vs. 62%), that the Negro woman was more often advised by others to do so, that she more often did not want to marry her sex partner after discovery of her pregnancy if she had not been planning marriage beforehand, that she more often associated with her sex partner after the birth if they were not married, and that she more often felt marriage to her sex partner in the future was a definite possibility. 2 reasons for these findings were discussed: (a) Negroes have a lesser commitment to the norm of legitimacy than whites, and (b) Negro women have less reason and desire than white women to marry. It is noted, however, that because of conceptual inadequacies and the lack of data, these 2 interpretations cannot be definitively supported.—*Journal abstract.*

8073. **Udry, J. Richard & Morris, Naomi M.** **Frequency of intercourse by day of the week.** *Journal of Sex Research*, 1970(Aug), Vol. 6(3), 229-234.—Data derived from daily reports of sexual behavior of 3 different samples investigated whether or not the probability of coitus occurring on Saturday or Sunday is higher than the probabilities for other days in the week. The only sample that indicated a weekend pattern was the white female (educated) group, both married and unmarried. Data from the Negro, low-educated females and Negro, middle- and lower-class males indicated Monday, Tuesday, or Wednesday as the peak days for intercourse.—E. B. Jaffa.

8074. **Veith, Ilza.** (U. California, San Francisco) **"Education for morality": Sex education—Victorian style.** *Bulletin of the Menninger Clinic*, 1970(Sep), Vol. 34(5), 292-303.—Presents a historical review of 2 major Victorian writers (Thomas Beddoes and Elizabeth Blackwell) on sex education. Their relationship to present-day sex educational approaches is examined.—J. Z. Elias.

8075. **Weller, Robert H.** **Role conflict and fertility.** *Social & Economic Studies*, 1969(Sep), Vol. 18(3),

263-272.—Investigates the effects of role conflict, current employment status, previous employment experience, and developmental status of the economy in the relationship between fertility and female participation in the labor force. Changes in the nature of female employment are examined in data from predominantly lower- and middle-class female residents of Puerto Rico. It is concluded that certain aspects of employment do affect fertility and that if a program is "to be effective in lowering fertility, the overall goal should be to create alternative modes of behaviour in such a way that the worker is motivated to restrict her fertility to a level lower than otherwise would be the case."—G. Steele.

Birth Control & Abortion

8076. **Anderson, T. W.** (U. Toronto, School of Hygiene, Ontario, Canada) **Oral contraceptives and female mortality trends.** *Canadian Medical Association Journal*, 1970(May), Vol. 102(11), 1156-1160.—Compared death rates for 15-44 yr. old Ontario females before and after 1961 to see if there have been any changes in these rates related to the widespread use of oral contraceptives since 1961. Overall mortality has declined significantly during this time, as have the rates for deaths due to childbirth and pregnancy, and from cancer of the uterus. Death rates from ischemic heart disease and cancer of the breast have not shown any significant change, but there has been a substantial increase in the rates ascribed to venous thromboembolism and suicide. It is stressed that a change in the recorded death rate does not necessarily mean that there has been a corresponding change in the incidence of the disease in question, or that such a change is related to the use of oral contraceptives. However, it is concluded that if oral contraceptives do cause an increase in a fatal disease, the effect should show up, sooner or later, in routine mortality statistics, and periodic examination of death rates provides a useful starting point for more detailed epidemiological investigation. (French summary)—*Journal abstract.*

8077. **Fleck, Stephen.** (Yale U., Medical School) **Some psychiatric aspects of abortion.** *Journal of Nervous & Mental Disease*, 1970(Jul), Vol. 151(1), 42-50.—Presents data from the literature concerning the psychiatric elements found in women who request and obtain abortions under regular medical auspices and experience with several hundred unwillingly pregnant females. The importance of abortion as a stopgap for contraceptive failure and as a significant family-planning measure is discussed. Abortion in itself is a safe, simple procedure without clinically significant psychiatric sequelae, but it becomes an emotionally traumatic experience because of the medicolegal obstacles which lead 1,000,000 or more women to seek illegal abortions in contrast to some 10,000 legal abortions performed annually. Psychiatric considerations must extend to the unhealthy consequences of unwanted pregnancy and motherhood and the risks for the emotional development and personality of the unwanted offspring. (42 ref.)—*Journal abstract.*

8078. **Howells, John G.** (Ipswich & East Suffolk Hosp., Inst. for Family Psychiatry, England) **Extended birth control: Abortion on request.** *Canada's Mental Health*, 1970(Sep), Vol. 18(5), 3-8.—Examines various problems involved in extended birth control, e.g., woman's rights, ethics, basis for legislation, time limit, and assent. Legal, religious, and sociological factors are

discussed. It is concluded that the woman should have the right to terminate an unwanted pregnancy.—G. Steele.

8079. Huffer, Virginia; Levin, Leon, & Aronson, Harriet. (U. Maryland, Medical School, Baltimore) **Oral contraceptives: Depression and frigidity.** *Journal of Nervous & Mental Disease*, 1970(Jul), Vol. 151(1), 35-41.—Correlated the use of oral contraceptives with the development of mood and/or sexual disturbances and, when a relationship was found, determined whether such disturbance fell into any predictable pattern. Hypothesized variables included: (a) previous history of psychiatric disorders, (b) current life stresses, (c) attitudes toward contraception, (d) symptoms due to expectations of the effect of the pill, (e) marital and sexual adjustment, (f) physiological alteration secondary to pill usage, and (g) reaction to pregnancies. 39 21-45 yr. old women from a private patient population were studied. 16 experienced adverse psychological symptoms. 23 had no emotional difficulty and were used as controls. Ss were studied by interview and the MMPI. Of those who had difficulty, 11 showed depressive reactions and 5 had loss of sexual interest not related to depression. All developed these symptoms while on the oral contraceptives and lost them after discontinuance. Affected Ss could not be differentiated from controls by any of the hypothesized variables. However, 2 factors tended to correspond with the development of adverse reaction: (a) use of the combined (as opposed to sequential) type of contraceptive pill, and (b) age of the S. Results suggest that women who have adverse reactions to oral contraceptives might represent a biochemically different subgroup in whom estrogen-progesterone steroids are the triggering mechanisms for mood and sexual disturbances. (21 ref.)—*Journal abstract*.

8080. Levene, Howard I. & Rigney, Francis J. Law, **preventive psychiatry, and therapeutic abortion.** *Journal of Nervous & Mental Disease*, 1970(Jul), Vol. 151(1), 51-59.—Discusses changes in antiabortion laws because of 3 modern developments: (a) advances in medical science minimizing the risk of operative procedures, (b) the desire to control overpopulation, and (c) the growing emphasis on individual human rights and civil liberties. Because of certain political pressures, legislators have not abandoned the archaic laws but have merely liberalized them. The inclusion of mental health provisions in the liberalized laws places the psychiatrist in the position of granting dispensations and forming new definitions. Although there are objections to such utilization of psychiatrists by the legal system, it is felt that the psychiatric profession must remain involved in the question of abortion in light of the present evidence that to force a woman to carry a pregnancy to term against her will may be detrimental to her mental health and to that of her unborn child. Evidence is reviewed by comparing previously reported psychiatric outcome in women who were refused abortion with the outcome in women granted abortion in the United States and Sweden (24% of women denied abortion show significant, continuing psychiatric disability at 7-11 yr. follow-up, vs. 0-2% significant psychiatric disability after therapeutic abortion). A study of 120 children born after application for therapeutic abortion was refused shows that they had greater social and emotional handicaps than their peers. Data collected by follow-up questionnaires sent to 70 consecutive women granted therapeutic abortion for psychiatric indications under a new

state therapeutic abortion law are presented. Results agree with those of previous studies: no serious psychiatric sequelae were found, guilt feelings were short lived, and depressive phenomena decreased significantly between 2 wk. and 3-4 mo. postoperatively. (32 ref.)—*Journal abstract*.

8081. Pfeiffer, Eric. (Duke U., Medical Center) **Psychiatric indications or psychiatric justification of therapeutic abortion?** *Archives of General Psychiatry*, 1970(Nov), Vol. 23(5), 402-407.—Under recently enacted abortion reform laws, the total number of abortions and the proportion of abortions for psychiatric reasons has increased dramatically. It is possible for psychiatrists to distinguish between psychiatric indications and psychiatric justification of abortion. Instances involving psychiatric indications are properly in the domain of the psychiatrist; instances involving psychiatric justification should be removed from the domain of psychiatry since it is extremely difficult to distinguish psychiatric justification and "abortion on request." Further changes in abortion laws are probably in the offing and these are likely to contain sanctioning of abortion for social, economic, and hardship reasons. Some of the possible consequences of a policy of "abortion on request" are considered.—*Journal summary*.

8082. Senay, Edward C. (U. Chicago, Pritzker Medical School) **Therapeutic abortion: Clinical aspects.** *Archives of General Psychiatry*, 1970(Nov), Vol. 23(5), 408-415.—Discusses the psychological crises attendant upon the patient seeking abortion. It is suggested that these patients need and ethically require the best medicopsychological care possible. It is noted that at present there is confusion and variability about legal directives to physicians surrounding therapeutic abortion. Therefore psychiatrists need to be clear in their values as they attempt to intervene rationally in such cases. Indications and contraindications for abortion are summarized, e.g., abortions are contraindicated when the patient feels she must comply with the wishes of someone else rather than her own. Suicidal risks and problems of management are discussed.—P. McMillan.

ATTITUDES & OPINIONS

8083. Ahammer, Inge M. (West Virginia U.) **Desirability judgments as a function of item content, instructional set, and sex: A life-span developmental study.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1514.

8084. Bebbington, A. C. (London School of Economics, England) **The effect of non-response in the sample survey with an example.** *Human Relations*, 1970(Jun), Vol. 23(3), 169-180.—Examined the varieties of nonresponse in a sample survey based on a cohort study of 13-yr-old schoolboys in London. The study was originated in 1951 and respondents were followed-up 10 yr. later. Nonrespondents in the follow-up were divided into those who had emigrated, the "elusive," the "stallers," the "refusers," and those who had died. Responders were generally better balanced and more intelligent. Emigrants showed no significant differences. The elusive were more likely to come from broken homes and tended to minor delinquency. Stallers were less intelligent, lower in social class, and showed antisocial and amoral attitudes. Refusers were high on the environmental response factor. Varieties on nonresponse

will bias survey results in multiple ways.—W. W. Meissner.

8085. Ehrlich, Howard J. & Van Tubergen, G. Norman. (U. Iowa) **Exploring the structure and salience of stereotypes.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 113-127.—Describes a study of 2 theoretical issues: (a) that systems of stereotypes can be viewed as a multidimensional structure, and (b) that stereotyping systems can be better understood in terms of their components. In Study I, with 91 undergraduates, 2 sets of atheist stereotypes (1 positive and 1 negative) and 3 sets of Jewish stereotypes (2 negative and 1 positive) were isolated through factor analysis. In Study II, with 67 Ss, it was demonstrated that these directionally consistent sets of stereotypes could be reproduced by another method of analysis, the paired comparisons of sets of stereotypes. It is concluded that (a) there existed more than 1 distinct and identifiable system of stereotypes for the groups studied; (b) ethnic stereotype systems tend to be directionally consistent; (c) as stereotype systems increase in salience, they increase in intensity; and (d) the relation between the direction of a stereotype system and its salience remains unclear.—*Author abstract.*

8086. Gibbons, Don C. (San Francisco State Coll.) **Crime and punishment: A study in social attitudes.** *Social Forces*, 1969(Jun), Vol. 47(4), 391-397.—Investigates the relationships between punitive sanctions directed at offenders and public sentiments about appropriate penalties. Previous studies are noted. An investigation in California in which citizens indicated the degree of punishment appropriate for 20 different crimes is reported. The most visible and coercive offenses received the most severe penalty choices and these are crimes which are severely punished in the state. However, some discrepancies between citizen preferences and penalties currently imposed were also observed.—*Journal abstract.*

8087. Lubchansky, Isaac; Egri, Gladys, & Stokes, Janet. (Lamuz Hosp., Buenos Aires, Argentina) **Puerto Rican spiritualists view mental illness: The faith healer as a paraprofessional.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 312-321.—Examines the attitudes and beliefs about mental illness of 20 faith healers in the Puerto Rican community of New York City; these were compared with data collected earlier from samples of Spanish-speaking community leaders and a cross-section of Puerto Rican household heads. Spiritualists appear to be an idiosyncratic group differentiated within their culture for the purpose of healing. The lack of professional acknowledgement of the role native healers play in this and other minorities is emphasized, and 2 case studies that may help to explain this lack of acknowledgement are presented. (25 ref.)—*Journal abstract.*

8088. Yang, Pen-hua Lee & Yang, Kuo-shu. (National Taiwan U., Taipei) [National-ethnic stereotypes of 240 Chinese students at the National Taiwan University.] *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 7-23.

Formation & Change

8089. Epstein, Yakov M., Buchanan, Elena, & Landon, P. Bruce. (Rutgers State U.) **Effects of set on the "effects of mere exposure."** *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 121-123.—Replicated 1 of R. B. Zajonc's (see PA, Vol. 42:12019)

studies on the attitudinal effects of differential exposure, using 6 "Chinese characters" at exposure frequencies of 0, 1, 2, 5, 10, and 25. Each of 72 undergraduates saw 1 stimulus at each frequency. $\frac{1}{2}$ of the Ss were given a favorable set toward the stimuli, the other $\frac{1}{2}$, an unfavorable set. The 1st group's ratings were similar to those reported by Zajonc. The other group's ratings were a curvilinear function of exposure, with the most negative ratings at 0 and 25 exposures. Set apparently determines evaluation after the stimulus becomes moderately familiar.—*Journal abstract.*

8090. Berger, Wallace G. (Michigan State U.) **Some correlates of attitude change, retention of the attitude message, and evaluation of the communicator.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1515.

8091. Chalmers, Douglas K. (U. California, School of Social Sciences, Irvine) **Repetition and order effects in attitude formation.** *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 219-228.—Tested hypotheses regarding repetition and presentation order in an impression-formation task with 188 female undergraduates. The effects of repetition indicate that (a) repetition of information added a negative evaluative component to both favorable and unfavorable communications; (b) unlike unfavorable information, repeating favorable information was more effective at the end of a communication than at the beginning; and (c) in line with the verbal memory hypothesis (in which specific memory influences judgment), repetitious communications cancelled the usual primacy effect, although usual primacy did not obtain for 1 control condition. Where primacy occurred, it occurred for communications containing evaluatively opposed information, but not for unopposed communications. This finding supports a change of meaning account of primacy, but does not support an attention-decrement account.—*Journal abstract.*

8092. Dillehav, Ronald C. & Clayton, Marilyn L. (U. Kentucky) **Forced-compliance studies, cognitive dissonance, and self-perception theory.** *Journal of Experimental Social Psychology*, 1970(Oct), Vol. 6(4), 458-465.—Attempted (a) to replicate D. J. Bem's (see PA, Vol. 42:2500) previously reported interpersonal simulation of the L. Festinger and J. M. Carlsmith (see PA, Vol. 34:1158) experiment; and (b) to test a major assumption of self-perception theory, i.e., that self-reports of attitude under conditions of high incentive will be regarded by an O as mands rather than facts. Results indicate that O Ss cannot reliably replicate involved S responses. Data provide negative evidence for the assumption that O Ss will regard behavior under conditions of high incentive as manding reinforcement, and suggest that greater incentive for attitude-discrepant behavior increases the perceived potency of reward in inducing actual attitude change.—*Journal abstract.*

8093. Hjelle, Larry A. & Clouser, Randall. (State University Coll. New York, Brockport) **Susceptibility to attitude change as a function of internal-external control.** *Psychological Record*, 1970(Sum), Vol. 20(3), 305-310.—Hypothesized and confirmed that "externally controlled Ss will show more attitude change when exposed to standardized communications advocating a change in their preestablished positions than will internally controlled Ss." The Internal-External Locus of Control (I-E) Scale and a College Opinion Survey (COS) were administered to 16 male and 16 female under-

graduates. 5 wk. later Ss were divided into small groups and given a booklet containing the alleged opinions of an authority on all COS items. Ss reindicated their degree of agreement or disagreement to the COS items. Sex differences were not significant, but the internal-external differences were ($p < .001$) in the predicted direction.—S. Knapp.

8094. Pitz, Gordon F. (Southern Illinois U.) **An inertia effect (resistance to change) in the revision of opinion.** *Canadian Journal of Psychology*, 1969(Feb), Vol. 23(1), 24-33.—Earlier studies have reported a reluctance of Ss to reduce their confidence in a decision following disconfirming information. This inertia effect may be due to a commitment process, or to the fact that Ss expect some disconfirming information to occur. To test the commitment hypothesis, 5 groups of Ss, with 15 male undergraduates each, were run in a sequential decision-making task, under conditions of varying levels of commitment to preliminary confidence judgments. An inertia effect, measured directly, or through an increase in confidence as a function of sample size, was present in Ss who gave confidence judgments that were displayed or could easily be recalled. In other Ss the effect was absent. It is concluded that the inertia effect was the result of Ss' commitment to their initial judgments. (French summary)—*Journal abstract*.

Influence & Behavior

8096. Cook, Stuart W. (U. Colorado) **Motives in a conceptual analysis of attitude-related behavior.** *Nebraska Symposium on Motivation*, 1969, Vol. 17, 179-231.—Discusses attitude-related behavior (segregation, prejudice, discrimination, etc.) toward disliked groups using a conceptual analysis developed by the author. Interracial public housing of 2 extreme types (segregated by areas vs. complete integration) was the setting for the research. 5 characteristics of unintended interracial contact were identified which were linked with favorable attitude changes and friendly behavior. These were then studied in the laboratory. 4 time stages in the conceptual analysis and 3 additional features are covered in detail. Comments by P. Zimbardo follow. (27 ref.)—J. M. Roberts.

8097. Lester, David & Kam, Elizabeth G. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Effect of a friend dying upon attitudes toward death.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 149-150.—Reports results of a questionnaire on death attitudes administered to 100 female undergraduates. The experience of recent loss was found to have a weak but consistent effect on attitudes toward death. The effect was to increase preoccupation with thoughts of death and the depressing effect of death stimuli.—*Author abstract*.

8098. Tarter, Donald E. (U. Alabama, Huntsville) **Toward prediction of attitude-action discrepancy.** *Social Forces*, 1969(Jun), Vol. 47(4), 398-405.—In an attempt to predict behavior discrepant from measured attitudes, an instrument is developed which utilizes T. Parsons and E. A. Shils' pattern-variable scheme. 40

undergraduates were selected out of 338 Ss tested to ascertain their racial attitudes. These Ss were forced to activate their attitudes in the face of social opposition. The instrument is unable to predict discrepant behavior, but the diffuseness-specificity variable is found to be an excellent predictor of actual situational behavior in an experimental situation which makes that dilemma paramount. Emphasis is placed on the fact that individual pattern-variable dilemmas, when measured, offer a way to significantly increase prediction of actual behavior.—*Journal abstract*.

GROUP & INTERPERSONAL PROCESSES

8099. Balswick, Jack O. & Anderson, James A. (U. Georgia) **Role definition in the unarranged date.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 776-778.—Discusses the accuracy of role definition on the part of individuals in dating situations. Data are based on responses of 417 undergraduates to questionnaires. It was found that both males and females misread the sexual expectations of members of the opposite sex, and both always do so in the direction of increased permissiveness. A tentative suggestion is made that such inaccuracy in role definition will result in sexual standards being liberalized.—*Journal abstract*.

8100. Blackburn, James R. (U. Arkansas) **The efficacy of modeled self-disclosure on subject's response in an interview situation.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1529-1530.

8101. Eisenberger, Robert; Carlson, Carl; Kuhlman, David M., & Williams, Daniel C. (U. California, Riverside) **More help for those who try harder.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 451-454.—Postulated that the amount of altruistic helping behavior is an increasing function of the effort which the donor believes is being expended by the recipient in pursuit of a goal. To test this, 42 male undergraduates were given the opportunity anonymously to help a peer (actually a confederate of E) whom they perceived to be unsuccessfully attempting to perform an act. As predicted, S's rate of helping responses increased, the greater the recipient's rate of unsuccessful attempts.—*Journal abstract*.

8102. Force, Elizabeth J. (Michigan State U.) **Personal changes attributed to human relations training by participants, intimates and job colleagues.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1535-1536.

8103. Foulds, Melvin L., Wright, James C., & Guinan, James F. (Bowling Green State U., Counseling Center) **Marathon group: A six month follow-up.** *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 426-431.—Reports a follow-up study of the effects of a 24-hr marathon group experience. 15 college students were interviewed 6 mo. after the experience and were asked their opinions regarding 12 questions dealing with the long-range effects of the group session. The results reflect a highly positive regard for the perceived value of the experience. Specific examples of increased personal growth include increased awareness of and contact with inner feelings, greater spontaneity, openness, honesty, self-confidence, and trust in others, as well as increased feelings of empathy for and identification with others.—R. H. Mueller.

8104. Hall, Jay & Watson, W. H. (American Behavioral Science Training Lab., Houston, Tex.) **The effects of a normative intervention on group decision-**

making performance. *Human Relations*, 1970(Aug), Vol. 23(4), 299-317.—Reports on a study to evaluate effects of normative interventions (instructions defining and legitimizing new forms of procedure) on solution of a moon-survival problem by 148 management seminar participants divided into 6 member groups. Instructed groups showed an increase of group decision quality, seemed to benefit significantly from emergent judgments and therefore showed a higher level of creativity, and showed a synergy bonus in being able to improve performance significantly over that of their superior resources in decision-making. Instructed groups did not show any significant difference in use of available resources. Uninstructed groups tended to resort to majority rule to resolve conflicts, so that majority decisions approximate those of the group's average member in quality. Normative instructions were aimed at minimizing the strain toward convergence in naive groups, thus modifying a significant systemic element of the group process.—*W. W. Meissner*.

8105. **Hirschman, Bernardo & Muratorio, José L. La enseñanza de dinámica de grupos a través de técnicas grupales.** [Group dynamics teaching through group techniques.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Mar), Vol. 16(1), 39-44.—Reports an experience of group dynamics teaching at the university level. The plan included direct group experiences, used to reach evidence in the group phenomenon, and a working (learning) level. It is concluded that this kind of teaching plan is useful in group dynamics training.—*English summary*.

8106. **Hood, Thomas C. & Back, Kurt W. (U. Tennessee) Self-disclosure and the volunteer: A source of bias in laboratory experiments.** *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 130-136.—Examined the nature of bias introduced by using 39 male and 55 female undergraduate volunteer Ss in laboratory experiments. Ss were given a questionnaire containing anxiety, social desirability, and self-disclosure scales. Ss were then given the opportunity to volunteer for experimental participation. Statistically significant differences in the mean amounts of past self-disclosures appeared. Male volunteers were higher in self-disclosure than male nonvolunteers. Females showed the relationship mediated by other factors. An interpretation of these findings suggests that the potential S views the experiment as a self-revealing situation. Individuals may vary in their attraction to self-revealing situations; this variation can introduce an uncontrolled bias into experimental studies. (26 ref.)—*Journal abstract*.

8110. **Křivohlavý, Jaro. Experimentální výzkum účinnosti slibů.** [Experimental research into the effectiveness of promises.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(2), 119-130.—The effect of the quality of promises, which was the trustworthiness of the promising person, on the solution of interpersonal conflicts was studied using experimental games. A number of variables was systematically changed including: (a) the source of the promised reward, making it possible to study promises with both internal and external reward; and (b) the position of power of the partners who are in mutual conflict. It was found that the theory of effectiveness of promises on the solution of interpersonal conflict takes all these factors into consideration. It is concluded that the theory of credibility of promises which combines the relationship of power between the partners and the credibility of the promise is the most acceptable. (Russian summary)—*English summary*.

8111. **Kroger, Rolf O. & Briedis, Irene. (U. Toronto, Ontario, Canada) Effects of risk and caution norms on group decision making.** *Human Relations*, 1970(Jun), Vol. 23(3), 181-190.—Studied risk and caution conditions on 139 university students in small groups. Results support Brown's value theory of group decision-making. Exposure to social norms of risk and caution produced, respectively, risky and conservative shifts in decisions. Exposure did not produce such shifts in the absence of relevant discussion. "The present results suggest that Brown's theory should be expanded so that the situation in which the decisions are made as well as the content of the problem is seen as determining the social norms or rules which are perceived as being applicable to a given problem."—*W. W. Meissner*.

8112. **Leyens, Jacques-Philippe. (U. Louvain, Belgium) Influence de la distance psychologique et de l'éducation sur l'identification.** [Influence of psychological distance and education on identification.] *Bulletin Centre d'Etudes et Recherches Psychotechniques*, 1969(Jul), Vol. 18(3-4), 255-266.—Presents a synthesis of existing research which supports the assumption of a nonlinear relationship between an S's identification with a model and the psychological distance between them. This distance depends on security and possibilities of gratification emanating from the model; gratification increases, whereas security decreases as the distance increases, and identification is highest for an optimal psychological distance. Moreover, personality variables probably come into play, since this distance is always subjective. 120 French-speaking undergraduates, served in an experiment with psychological distance and security (reduced by the prospect of punishment) manipulated, and these variables subsequently analyzed with respect to identification scores. Results show that identification is highest: (a) for an optimal distance; (b) when security is present; (c) in Ss educated in a democratic manner; (d) when these 3 factors interact with each other; and (5) when extended contact with the model increases identification, but only with minimal security. (32 ref.)—*English summary*.

8114. Mackenzie, Kenneth D. (U. Waterloo, Ontario, Canada) **The effects of status upon group risk taking.** *Organizational Behavior & Human Performance*, 1970(Nov), Vol. 5(6), 517-541.—Defines and uses a decision model of the M. A. Wallach and N. Kogan (see PA, Vol. 39:8626) choice dilemma question to identify a model relating the impact of status differentials upon group risk taking. The model was tested on 48 mature, middle management level, federal employees working at the same installation and divided into groups of (a) 1 high status conservative and 2 lower status non-conservatives, (b) 1 low status conservative and 2 higher status nonconservatives, and (c) members at about the same level of status and conservatism. The high and low status conservatives shifted in a risky fashion and there was a significant overt conservative shift on the post-discussion questionnaire. The low status risky Ss shifted conservatively with a risky overt shift on the post-discussion questionnaire. High status risky Ss evidenced a risky shift with no overt conservative shift. The low status differential groups all tended to shift in a risky fashion with no subsequent conservative overt shift. Results are not consistent with either the R. Brown value of risk hypothesis or the M. A. Wallach, N. Kogan, and D. J. Bem (see PA, Vol. 38:10097) diffusion of responsibility hypothesis. (31 ref.)—*Journal abstract*.

8115. Meador, Betty D. (Center for Studies of the Person, La Jolla, Calif.) **Individual process in a basic encounter group.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 70-76.—Observed the process of change in 8 individuals who participated in an intensive small encounter group from the viewpoint of C. Rogers' process theory. Proceedings were recorded on film. 13 judges rated 80 segments, 1 segment selected at random for each S from the 1st and 2nd halves of the 5 sessions the group met. Ratings were made using the Rogers and Rablen Process Scale. Each S made significant ($p < .01$) positive process movement over the course of the group. Results support Rogers' theory both in the direction of movement and the kinds of changes individuals make under the stated conditions, and suggest that the weekend format induces greater process movement than weekly time-limited groups.—*Journal abstract*.

8116. Pellegrini, Robert J., Hicks, Robert A., & Gordon, Lance. (San Jose State Coll.) **The effect of an approval-seeking induction on eye-contact in dyads.** *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 373-374.—Tested the proposition that "with physical proximity held constant, an assigned approval-seeking role will enhance EC [eye contact] while the opposite effects will follow from an assigned approval-avoiding role." 24 female undergraduates were randomly assigned to approval-seeking, approval-avoiding, and control groups in which a 2-person interaction situation was established. Measures of both total duration and frequency of EC were obtained for each S. Results show that the order of the means on both EC measures was consistent with the hypothesis. 1 discrepant finding is discussed.—P. McMillan.

8117. Peters, George R. & Kennedy, Carroll E. (Kansas State U.) **Close friendships in the college community.** *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 449-456.—Investigated the development and maintenance of friendship ties on the part of 116 college students. The data gathered through interviews and questionnaires indicate that between $\frac{1}{3}$ and $\frac{1}{2}$ of the friendships were initiated at the university,

that the friendships developed either through another friend, through class contact, by living in the same residence, or spontaneously. Other findings include a positive relationship between the degree of intimacy of the friendship and the number of activities shared with friends. Men named more friends than women did and rural students listed more friends than did students from urban areas. The data reflect the importance of the university as the setting for initiating friendships, while off-campus relationships are also maintained. (22 ref.)—R. H. Mueller.

8118. Pollis, Carol A. (U. Wisconsin, Coll. of Community Sciences, Green Bay) **Dating involvement and patterns of idealization: A test of Waller's hypothesis.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 765-771.—Primary respondents (231 male and female undergraduates), representing 3 degrees of emotional involvement with their dating partners, and 462 of their best friends evaluated the frequency with which each primary respondent's dating partner exhibited 17 characteristics. Data were used to test the hypothesis, derived from W. Waller's analysis of idealization, that individuals tend to be differentially idealistic about their dating partners in the order of casual < moderate < serious involvement. Support for the hypothesis was not found among either male or female involvement groups. Male groups exhibited significant differences in total idealization scores indicating decreasing idealization with increasing involvement. Significant differences were not found among female groups, although data indicate a trend similar to that for males. An explanation is offered to account for findings.—*Journal abstract*.

8120. Stone, Thomas H. (U. Minnesota) **The effects of mode of organization, type of feedback, and source of evaluation on the performance and satisfaction of creative task groups.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1582.

8121. Vidmar, Neil & Hackman, J. Richard. (U. Western Ontario, London, Canada) **Interlaboratory generalizability of small group research: An experimental study.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 129-139.—Describes an experiment, examining the effects of group size and task type on group performance and member reactions, which was conducted simultaneously at 2 different university laboratories with 324 Ss. Considerable effort was expended to minimize as many differences as possible (i.e., same tasks, questionnaires, standardized instructions, and data analysis by the same research personnel). However, the laboratory factor accounted for a sizable number of main and interaction effects. These results were probably due to differences in S populations and/or the ways in which Ss were recruited (i.e., volunteering vs. required participation). Because differences between the replications were considerably less than those which exist between most small group studies, the generalizability of small group research is questioned. Suggestions for increasing generalizability are discussed. (22 ref.)—*Author abstract*.

8122. Watson, Eugene R. (U. North Carolina) **Interpersonal changes through immediate feedback approaches.** *Adult Education*, 1969(Sum), Vol. 19(4),

251-267.—Considers the improvement of the quality of interpersonal behavior as an increasing responsibility of adult educators. The desired changes, however, are difficult to state as objectives, and the outcomes even more difficult to assess. Research with programed materials and human relations laboratory training is reviewed. Systems for immediate and direct feedback on behavior are concluded to accomplish interpersonal changes in: self-awareness, perception of others, openness, acceptance, decrease in extreme needs, group understandings and skills, and self-confidence. The crucial role of the trainer is examined. (53 ref.)—*Journal abstract*.

8123. Williams, Robert L., Cormier, William H., Sapp, Gary L., & Andrews, Henry B. (U. Tennessee, Coll. of Education) **The utility of behavior management techniques in changing interracial behaviors.** *Journal of Psychology*, 1971(Jan), Vol. 77(1), 127-138.—Appraised the effects of 5 treatment conditions (contingent teacher reinforcement, peer reinforcement, role modeling, group process) and control on 2 major dimensions of interracial harmony, biracial sociometric measures and biracial behavioral interaction. 60 racial isolates in 5 racially balanced classes of a metropolitan junior high school served as Ss. A main effect positive change was obtained on both the sociometric and behavioral measures. Differences between groups in amount of change were statistically nonsignificant. However, the raw data indicate that the control group made the least improvement of any treatment group on both dependent variables.—*Journal summary*.

8124. Zwiren, Abbie & Zielke, Susan. **Training group leaders in the 7-Step Technique.** *Journal of Emotional Education*, 1969(Sum), Vol. 9(3), 108-112.—Describes a 7-step technique of training group-leaders in "how to identify emotions, methods of developing emotional awareness, and [increasing] facility in problem-solving."—S. Appelle.

Influence & Communication

8125. Cook, Mark & Laljee, Mansur. (U. Oxford, England) **The interpretation of pauses by the listener.** *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 375-376.—Tested the hypothesis, originally presented by H. Maclay and C. E. Osgood, that filled pauses (FP) are signals by the speaker that he is not finished (even though he has paused) by determining whether such FPs are interpreted by listeners as meaning that the speaker has not finished. 2 experiments were made using 32 and 120 Ss, respectively. Results did not confirm the findings of Maclay and Osgood. In Exp. I, Ss took less time to conclude that the speaker had finished when his utterance ended with an FP, and in Exp. II the presence of a silent pause caused a majority of Ss to think the speaker had finished. Despite these findings, it is concluded that the methods of Maclay and Osgood are valid.—P. McMillan.

8126. Foot, Hugh C. & Lee, Terence R. (U. Wales, Inst. of Science & Technology, Cardiff) **Social feedback in the learning of a motor skill.** *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 309-319.—Studied the motivational effects of the transmission of results between members of a group performing a motor task. Ss were 15-yr-old school children. Exp. I compared learning by (a) 18 Ss in 3-man groups, whose feedback consisted of their own and each other's

results; and (b) 18 similarly grouped Ss, who received only their own results. The former Ss performed significantly better, and with less variability, than the latter. Exp. II, of similar design, varied the information received by Ss concerning whether or not their own results were displayed to the other group members. Findings suggest the operation of 2 processes: (a) reinforcement through evaluation of own performance with social norms, which significantly increased the rate of learning; and (b) motivation through an audience effect which increased the general level of performance. The evaluation process operated only after the 1st feedback of others' results, while the audience effect operated immediately. Findings are discussed in relation to other evidence from social comparison and audience studies. (29 ref.)—*Journal abstract*.

8127. Hardy, Kenneth R. & Larsen, Knud S. (Brigham Young U.) **Personality and selectivity factors as predictors of social conformity among college girls.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 147-148.—Reports results of 3 studies analyzing the behavior of 30 female undergraduates in resolving conflict between religious and general American norms in the areas of dress fashion, cosmetics, hair styling, and dance behavior. 2 studies employed validated self-report questionnaires, and the 3rd used actual dress-length measures. Religious norm support in the parental home, academic achievement, and living on campus at a parochial school were all related to closer adherence to the religious norms. The vast majority of Ss, however, adopted a moderate position between the conflicting norms.—*Author abstract*.

8128. Heller, Frank A. (Tavistock Inst. of Human Relations, Human Resources Centre, London, England) **Group feed-back analysis as a change agent.** *Human Relations*, 1970(Aug), Vol. 23(4), 319-333.—Discusses the possible applications of group feedback analysis (GFA) in effecting organizational change. Applications of GFA to various forms of action research are described. Analysis of the systematic feedback mechanism in GFA is contrasted with the level and focus of analysis of motivational forces in T-group processes. (59 ref.)—W. W. Meissner.

8129. Kadane, Joseph B. & Lewis, Gordon H. (Yale U.) **The distribution of participation in group discussions: An empirical and theoretical reappraisal.** *American Sociological Review*, 1969(Oct), Vol. 34(5), 710-723.—The distribution of participation in small task-oriented group discussions has been described as harmonic or exponential. With evaluations based on different measures of goodness of fit, the harmonic function was rejected, and the exponential function accepted in its place. Reanalysis of the evidence shows that the exponential function does not describe the data any better than the harmonic. Several attempts have been made to explain why an exponential relation should occur. Since no explanations have been offered for the harmonic, the existence of explanations for the exponential relation should play a crucial role in the choice of a description. Analysis of the proposed explanations of the exponential reveals them to be inadequate. (15 ref.)—*Journal abstract*.

8131. Liendo, Ernesto C. **Análisis de un modelo**

posible de Interpretación en el grupo operativo: El trabajo con grupos operativos: I. [Analysis of a model of interpretation for operative groups: I.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969(Mar), Vol. 15(1), 34-42.—Proposes a theoretical model of interpretation to be applied with operative groups. It is based on the assumption that whatever is communicated by a member of a group must be interpreted in 3 levels, as an expression (a) of all the members of the group; (b) of a transferential link between the members of the group and the coordinator; and (c) of the structure composed by the group, the coordinator, and their common task.—*English summary.*

8132. Liendo, Ernesto C. **Momentos típicos en el trabajo con grupos operativos: El trabajo con grupos operativos: II. Pretarea, dilema-problema, decisión y nuevo proyecto.** [Characteristic moments in operative groups' work: Work with operative groups: II. Pretask, dilemma, problem, decision and new project.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969(Mar), Vol. 15(1), 43-54.—Describes and exemplifies a theoretical model of interpretation to be applied with the operative group. Different "moments" of the therapeutic session are noted: pretask (preparatory to the session's task); evident dilemma (the group coordinator points out the evident, and interprets the latent, dilemma); evident problem (the coordinator points out the evident, and interprets the latent, problem); decision (insight, synthesis attained); and new project.—*English summary.*

8133. Monaghan, Robert R. & McCarthy, Kathleen E. (Ohio State U.) **A media-directed communication learning program.** *Group Psychotherapy & Psychodrama*, 1970, Vol. 23(1-2), 5-15.—Describes a self-supervised, TV-taught workshop aimed at promoting individual improvement in interpersonal relationships and communication. Each of the 9 sessions is fully described.—*A. Krichew.*

8134. Myers, David G. & Bishop, George D. (Hope Coll.) **Discussion effects on racial attitudes.** *Science*, 1970(Aug), Vol. 169(3947), 778-779.—Predicted that discussion would enhance dominant group values, leading to increased polarization between homogeneously composed groups of high-, medium-, and low-prejudice high school Ss (N=256). Ss had previously been administered the Woodmansee and Cook Multifactor Racial Attitude Inventory. In an experimental condition, Ss made individual attitude judgments, discussed them, and remade judgments. Controls discussed irrelevant materials before responding again to the attitude items. As predicted, discussion of the racial attitude items with others having similar attitudes significantly increased the gap between high- and low-prejudice groups.—*Journal abstract.*

8135. Saltzstein, Herbert D. & Diamond, Rhea M. (Massachusetts Inst. of Technology) **Transfer of social influence effects across stimulus modalities.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 91-98.—Describes an experiment testing whether or not social influence effects on judgments are due to an actual change in the judge's strategy, method, or standard, using a transfer procedure. Young male adult Ss made base-line judgments, separately, of the roughness of abrasives and the heaviness of weights. A cross-modal matching procedure was used whereby Ss produced lengths of a (blank) tape to match the magnitude of the stimuli. In a 2nd session, the judgments of roughness

were influenced by exposure to discrepant estimates made by a (confederate) peer. Afterwards and in private, Ss showed an influence effect on both judgments of roughness and weights (which they had never seen the peer judge).—*Author abstract.*

8136. Singh, Yadavendra P. & Pareek, Udai. (Punjab Agricultural U., Hissar, India) **Discriminant function in a profile pattern of key-communicators in an Indian village.** *International Journal of Psychology*, 1970, Vol. 5(2), 99-107.—Study of interpersonal communication in an Indian village through acts performed by key communicators as compared to noncommunicators, reveals key communicators as higher in socioeconomic status, a variable significantly correlated with other variables investigated: social preference, contact with change agents, adoption of new practices, skill in communicating effectively, and influence on decision-making. In Indian villages, leadership generally rests with few persons, a condition typical of authoritarian culture. Persons high in socioeconomic status find their situation reinforced, perpetuated. To build new leadership, it would be interesting to try and to evaluate new ways of effecting change. (French abstract) (32 ref.)—*S. E. Gavin.*

8137. Sistrunk, Frank & McDavid, John W. (State University System of Florida, Tallahassee) **Sex variable in conforming behavior.** *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 200-207.—Reports the results of 4 experiments with 80, 90, and 60 undergraduates, respectively, in Exp. I, II, and IV, and 40 high school students in Exp. III. Ss performed a 65-item conformity measure constructed to control for sex relatedness of the judgmental task. Data led to the conclusion that the simple explanation of sex differences in conformity as a function of cultural role prescriptions is inadequate, and that a disregard for the nature of the experimental tasks has contributed to artificially inflated observations of sex differences in conformity. (31 ref.)—*Journal abstract.*

8138. Slater, Robert. (Liverpool U., Medical Research Council, England) **Characteristics of cooperation in a volunteer panel.** *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 371-372.—Examined differences between responders and nonresponders from a panel of 690 volunteers to a simple 3-page questionnaire. Variables studied for response characteristics were age, sex, intelligence (verbal and nonverbal), social class, educational level, and personality measures of neuroticism and sociability. Results suggest that overall differences that did occur are determined more by the response patterns of the women than the men. It is concluded that characteristics of the cooperative individual are not necessarily those of the cooperative man but are those of the cooperative woman.—*P. McMillan.*

L'Abate.*

8140. Ziller, Robert C., et al. (U. Oregon) **The neutral in a communication network under conditions of conflict.** *American Behavioral Scientist*, 1969(Nov), Vol.

13(2), 265-282.—Investigated "persuasion in the presence of a neutral member and under varying conditions of tenure of the persuader," the effect of the neutral's position in the communications network, and the difficulty of decision-making. Ss were 48 new naval recruits in Exp. I and 83 volunteer male undergraduates in Exp. II. It is concluded that "the neutral widens the scope of conflict" by expanding it into the ethical domain and prolonging it. Results are examined in relation to their implications for a democratic sociopolitical form.—G. Steele.

Social Perception & Motivation

8141. Aronson, Elliot. (U. Texas) **Some antecedents of interpersonal attraction.** *Nebraska Symposium on Motivation*, 1969, Vol. 17, 143-173.—Reviews several years of experimental work on "what makes people like one another." People tend to like people who are close to them, agree with them, are similar to themselves, are "nice," who like them in return, whose needs interact with theirs, and who are competent. Visual perception (as opposed to nonvisual perception, e.g., the sense of touch) is mentioned as exercising a very conservative influence on our judgments of people as homely, funny-looking, ugly, pretty, etc. Comments by P. Zimbardo follow. (52 ref.)—J. M. Roberts.

8142. Barefoot, John C. & Straub, Ronald B. (Carleton U., Ottawa, Ontario, Canada) **Opportunity for information search and the effect of false heart-rate feedback.** *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 154-157.—Investigated the role of information search in the attribution of physiological states by manipulating the S's opportunity for information search following the presentation of false information about his heart-rate reactions to photographs of female nudes. 36 male undergraduates served as Ss. Consistent with the self-persuasion hypothesis proposed by S. Valins, the rated attractiveness of the slides was not affected by the false heart-rate feedback for Ss who were prevented from visually searching the slides. Ss who had ample opportunity to view the slides rated those slides accompanied by false information of a heart-rate change as more attractive than those slides which were not paired with a change in heart rate.—*Journal abstract.*

8143. Bergius, Rudolf; Werbig, Hans, & Winter, Gerhard. (U. Tübingen, Psychological Inst., W. Germany) **Urteile deutscher Arbeitnehmer über Völker in Relation zur Zahl ihrer ausländischen Bekannten: I. Theorie, Methode der Erhebung und kollektive Stereotypen.** [Judgments of German workers about other people in connection to the number of their foreign acquaintances: I. Theory, method and collective stereotypes.] *Psychologische Beiträge*, 1970, Vol. 12(2), 241-310.—Provides a short orientation regarding drive-dynamic, stimulus response, theoretical, and cognitive-theoretical aspects in order to explain the connection between the judgments of 800 German workers regarding people and the number of their foreign acquaintances. The method of questioning, selection of the sample, and the found stereotypes are discussed. (31 ref.)—*English abstract.*

8144. Dienstbier, Richard A. & Munter, Pamela O. (U. Nebraska) **Cheating as a function of the labeling of natural arousal.** *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 218-213.—Hypothesized that it is not emotional arousal per se which

influences one to inhibit or avoid cheating, but one's interpretation of the meaning and significance of that arousal. 105 naive undergraduates were told that this was a study of a vitamin supplement's effects on vision, and given 1 of 2 lists of side effects associated with the placebo pill. While waiting for the visual-perception task, Ss experienced failure on a vocabulary test, supposedly predictive of college success, and received an opportunity to cheat on the test by changing answers. It was anticipated that all Ss who considered cheating would experience some arousal, but Ss told to expect drug-induced side effects related to sympathetic arousal would not label their experienced arousal as fear or guilt, and would cheat more than Ss who anticipated benign side effects. Of Ss expecting arousal side effects, 49% cheated, as compared with 27% of the control Ss ($p < .025$). Sex differences and implications for theoretical approaches to emotion and conscience are discussed.—*Journal abstract.*

8146. Geen, Russell G. & Stonner, David. (U. Missouri) **Effects of aggressiveness habit strength on behavior in the presence of aggression-related stimuli.** *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 149-153.—Tested and confirmed the hypothesis that reinforced Ss react more aggressively to violence-related words than do nonreinforced Ss. 24 male undergraduates were given either a verbal reinforcer or no reinforcer for delivering electric shocks to another person each time a light went on. Reinforced Ss increased the intensity of shocks delivered over a long series more sharply than did nonreinforced Ss. Reinforced Ss also subsequently gave more intense shocks than nonreinforced Ss in response to a verbal stimulus related to aggression. Nonreinforced Ss inhibited aggression in the presence of aggressive verbal cues. Results are discussed in terms of antecedent habit strength which increases the intensity of responses to stimuli related to aggression. (15 ref.)—*Journal abstract.*

8147. Hare, A. Paul. (Haverford Coll.) **The Conditional Personality Test: A crosscultural analysis.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 141-142.—Administered a personality test to Peace Corps volunteers in the Philippines and university students in the United States, Nigeria, and the Philippines in which Ss indicated their responses to persons who were dominant, positive, submissive, and negative with specified age, sex, and intelligence characteristics. Results indicate that across cultures, Ss are more active with a younger person or 1 of less intelligence, and more agreeable with persons whose interaction pattern is consistent with their age and intelligence. Negative behavior pulls a negative response. Quiet-active behavior shows a greater variation between national groups than critical-agreeable behavior.—*Author abstract.*

8148. Herrenkohl, Ellen M. (New York U.) **A study of the influence of two forms of defensive projection on the perception of hostility in others.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1537-1538.

8149. Kelley, Harold H. & Stahelski, Anthony J. (U. California, Los Angeles) **Errors in perception of intentions in a mixed-motive game.** *Journal of Experimental Social Psychology*, 1970(Oct), Vol. 6(4), 379-

400.—Instructed 338 female undergraduate Ss in playing a version of the Prisoner's Dilemma game (PDG). Then, faced with the prospect of interaction with an unspecified partner, each S expressed her intention about how the PDG relationship should develop. An experimental design was formed by placing together pairs of Ss having similar or different intentions. Unaware of each other's expressed intentions, the Ss judged them at several points during their interaction. Their behavior in the game and parallel judgments made by Os of the game provided the context for interpreting errors in their judgments. Results indicate that the degree of cooperativeness of intention of noncooperative players is usually judged more accurately than that of cooperative ones. Judgments of the latter vary as a function of the cooperativeness of the person with whom they are playing, and the errors tend to be assimilative. Of 2 possible interpretations of these errors, projection vs. influence, the evidence favors the latter. Cooperators are found to exhibit behavior similar to that of the persons with whom they are interacting. Consistent with these judgmental and behavioral data are reports from the cooperative members of mixed pairs (Coop-Noncoop) indicating that they have greater difficulty maintaining their intentions than do their partners, and that they are aware of the lesser responsibility they have for the course of the relationship. Results are also reported for trends over blocks of trials.—*Journal abstract.*

8150. Lieblich, Amia. (Hebrew U., School of Education, Jerusalem, Israel) **Reaction to the frustration of the other.** *Human Relations*, 1970(Aug), Vol. 23(4), 335-344.—Studied responses to the frustration or arbitrary frustration of the other in a dyadic relation. The O's response of pity, trying to help, and reproach were more intense than others. Additional information on the arbitrariness or justice of the other's frustration could change the O's attitude. When the other is reported to have a positive need, Os react sympathetically. If frustration is unjust, he is still regarded as good; but if the frustration is just, he is seen as bad, and the reaction pattern changes. The results support the claim that people believe in a just world where individual value and lot are linked. The real situation of the other are used to evaluate him and his value.—*W. W. Meissner.*

8151. Rosenthal, Ted L., Rogers, Cecil, & Hurt, Maure. (U. Arizona) **Magical child-care beliefs and sequence and recall effects in social perception.** *Human Relations*, 1970(Jun), Vol. 23(3), 191-199.—Studied the influence of recency vs. primacy effects on social perception of 346 college sophomores. Evaluations of the stimulus character (including poverty, racial intermarriage, mental retardation, and suicidal depressions) were compared with ratings based on belief in a variety of magical child-care practices. Strong recency effects were found. The magic-1st order produced less rejection than the magic-2nd order. Effects were ascribed to attention and forgetting as a function of stimulus-vividness and were maintained after a 4-wk delay.—*W. W. Meissner.*

8152. Steinmann, Anne; Doherty, Mary A., & Fox, David J. (Maferr Foundation, New York, N.Y.) **Perceptions of women religious regarding the female role.** *National Catholic Guidance Conference Journal*, 1970(Fal), Vol. 15(1), 43-54.—Ss were 176 students and faculty members. Nuns of 20 yr. standing, in this study, were volunteers from the faculty. 75 controls were undergraduate public college women, comparable in the

age to the student nuns; 51 business women controls had an average age of that of the 30 faculty member nuns. The Maferr Inventory of Female Values was administered to each S under 3 forms: self-perception, woman's own ideal, and woman's man's ideal. Results showed that women in religious communities who are devoted to higher education have a different perception of the female role than do business women who are not in a religious community. Nun college faculty members showed striking differences in their scores from young student religious, not only in self-perception but in their perception of an ideal woman. Results suggest that these nuns express feelings as women and as individuals rather than the feelings that are commonly ascribed to them.—*A. M. Cawley.*

8153. Swingle, Paul G. (McGill U., Montreal, Quebec, Canada) **Ethnic factors in interpersonal bargaining.** *Canadian Journal of Psychology*, 1969(Apr), Vol. 23(2), 136-146.—Involved 64 male Canadian post-graduate students whose 1st language was either English (EC) or French (FC) in the Prisoner's Dilemma (PD) game against a bogus O who was represented as either an EC or FC. $\frac{1}{2}$ the Ss expected to meet O after the experiment, while the other $\frac{1}{2}$ were assured of anonymity. As predicted, both EC and FC were more forgiving—cooperation (C) following O's unilateral defection (D)—toward FC Os. Overall levels of C responses did not reveal reliable differences. Although there was a general trend toward greater disruption by FCs playing against ECs in the anonymity condition, the overall data indicate greater trustworthiness (C following CC) and repentance (C following DC) when Ss were assured anonymity. An illustration of the PD is included. (French summary) (19 ref.)—*Journal abstract.*

8154. Talley, Richard W. (Smith, Barney, & Co., New York, N.Y.) **Dissonance and expectations on a shop floor.** *Human Relations*, 1970(Aug), Vol. 23(4), 361-369.—Discusses the effects of cognitive dissonance and expectations on the behavior and attitudes of personnel on a shop floor. Managers were given misinformation about the ability of 2 groups, and even after contradictory results were available in which the supposedly excellent group performed poorly, many reasons were provided for their inability to perform. The results are taken to support the theory of cognitive dissonance as a motivating factor in its own right.—*W. W. Meissner.*

8155. Taylor, Donald M. & Gardner, Robert C. (McGill U., Montreal, Quebec, Canada) **Ethnic stereotypes: Their effects on the perception of communicators of varying credibility.** *Canadian Journal of Psychology*, 1969(Jun), Vol. 23(3), 161-173.—A French-Canadian speaker tape-recorded 2 messages, 1 confirming, the other disconfirming, the appropriateness of the French-Canadian stereotype to himself. 1 message was heard by 96 undergraduates under different conditions of credibility produced by varying message intent and setting, and political belief. Ss rated the speaker on semantic differential scales assessing stereotypical and evaluative attributes. Ratings on the stereotypical dimension were influenced by message content and setting, whereas ratings on the evaluative dimension were primarily influenced by message content and political belief. Results suggest that a member of an ethnic group can, under some situations, modify stereotyped reactions to him, but that this tends to engender an unfavorable reaction in the listener. (French summary) (15 ref.)—*Journal abstract.*

8156. Warr, Peter B. & Haycock, Valerie. (U. Sheffield, Social & Applied Psychology Unit, England) **Scales for a British personality differential.** *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 328-337.—Outlines a classification of judgment situations which highlights the need for different investigations to examine different sets of response dimensions. A study is described which employed orthodox procedures to elicit adjectival qualifiers from 100 men and women in lower- and middle-class occupations, and to produce a usable set of personality differential scales. The factor structure of these scales is examined in 2 separate analyses. In both cases a 6-factor solution appears most appropriate, such that 2 variants of evaluation, potency and activity are present. The relevance of this finding for cross-cultural studies of personal judgment is discussed.—*Journal abstract.*

8157. Weiss, Robert F. & Miller, Franklin G. (U. Oklahoma) **The drive theory of social facilitation.** *Psychological Review*, 1971(Jan), Vol. 78(1), 44-57.—Extended the scope and power of the drive theory of social facilitation with learning theory models of drive. Existing theory employs the irrelevant drive paradigm, in which neither the initiation nor the termination of audience observation is contingent on the behavior of the S or on the onset of the CS. Extensions include escape and avoidance of audience observation, and the classical conditioning of symbolic audiences. 9 methods for varying the strength of audience-induced drive are developed, based on the model of learned drive, including extinction, summation, generalization, acquisition, and 5 forms of inhibition. (3 p. ref.)—*Journal abstract.*

COMMUNICATION

8158. Brady, Paul T. (Bell Lab., Holmdel, N.J.) **Effects of transmission delay on conversational behavior on echo-free telephone circuits.** *Bell System Technical Journal*, 1971(Jan), Vol. 50(1), 115-134.—Attempted to determine the effects of echo-free transmission delays of 600 and 1200 msec. on conversational behavior when Ss were unaware that delay was present. 16 pairs of male Ss conversed 10 min. each over an echo-free telephone circuit with zero delay and 10 min. each with 600-msec roundtrip delay; a 2nd group of 16 pairs conversed 10 min. each on zero delay and 1200-msec roundtrip delay. Ss noticed nothing unusual about the circuit, but the delay caused a statistically significant increase in frequency of confusions and in amount of both double talking (simultaneous speech from both speakers) and mutual silence. Analysis by means of an on-off pattern generating model revealed that Ss seem to make some adjustments in their speaking behavior; they tend to wait longer for responses and keep talking longer when interrupted. The 2 delay values of 600 and 1200 msec. produced virtually identical effects in the measures made here. All Ss were inexperienced with delay circuits; this experiment does not address itself to the possibility that experienced Ss might react differently to the delay. Further work will investigate the effects of training Ss to notice delay.—*Journal abstract.*

8162. Weakland, John H. (Mental Research Inst., Palo Alto, Calif.) **Anthropology, psychiatry and communication.** *American Anthropologist*, 1969(Oct), Vol. 71(5), 880-888.—Examines new concepts of communication derived from anthropological and psychiatric studies and their applications in both fields. Communication is discussed as: (a) interaction and behavior; (b) expression and influence; (c) codification and interpretation; and (d) multiple—having verbal, non-verbal, and contextual aspects. In psychiatry these principles provide a method of understanding "confused, mixed, and receiving conflicting behavior... as possibly a logical or appropriate response to receiving conflicting messages," e.g., understanding the language of schizophrenics. In anthropology these concepts provide a framework for analyzing relationships and social contacts, ritual and ceremony, myths, and kinship patterns, and for broadening linguistic studies. "Once attention is explicitly focused on their communicative aspect, all sorts of behavioral phenomena... can be observed, analyzed, and above all interpreted, in terms of 1 general conceptual framework," and communication and applicability of findings between fields is facilitated. (20 ref.)—S. Knapp.

8166. Liberman, A. M. (U. Connecticut) **The grammars of speech and language.** *Cognitive Psychology*, 1970(Oct), Vol. 1(4), 301-323.—The conversion between phonetic message and acoustic signal, i.e., speech, is a grammatical code, similar in interesting ways to syntax and phonology. Being more accessible to experiment, speech should, therefore, be an inviting object of study for those interested in the psychology of grammar. Experiments on speech have already provided some information about the psychological processes associated with the use of grammatical codes. Each of these codes speeds communication by delivering the information in parallel. But the gain in speed is achieved at the cost of a considerable complication, since it is in the nature of the codes that they restructure the information; as a result, the levels they link do not correspond in the number or shape of their segments. It is argued that questions about the uniqueness of language are more likely to be answered satisfactorily at the level of speech than

elsewhere. Studying language at the level of speech enables one to go beneath language behavior down to the mechanisms that underlie it. (38 ref.)—H. W. Hamilton.

8167. Liu, In-mao & Chuang, Cong-jen. (National Taiwan U., Taipei) [Scaling 1,200 Chinese characters for meaningfulness.] *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 33-52.—Divided 1200 Chinese characters into 4 equal sets. Ss were 2000 undergraduates, divided into 4 equal groups who wrote down the 1st associate and, at the same time, rated the association value by means of a 5-point scale. For each character, Ss were to respond within 10 sec. Data, based on $\frac{1}{2}$ of the Ss, were analyzed according to scale value, popular response, 2nd popular response, percentage of responses, and number of distinct responses to each character.—English summary.

8168. Nordenstreng, Kaarle. Toward quantification of meaning: An evaluation of the semantic differential technique. *Annales Academiae Scientiarum Fennicae*, 1969, Vol. B-161(2), 35 p.—Describes the factor model of "semantic space," and criticizes the applicability of some of the assumptions of this model to the semantic differential. Also, the nature of the "meaning" measured is examined. It is concluded that the meaning measured does not exhaust the total meaning of the concepts and is in fact largely obscure. This is less a reflection on Osgood's technique than on the general lack of theory in the area of language meaning.—S. G. Vandenberg.

8169. Park, Tschang-Zin. (U. Münster, Psychological Inst., W. Germany) *Linguistische Bedingungen für lautsymbolische Experimente*. [Linguistic conditions for phonetic symbolism experiments.] *Psychologische Beiträge*, 1970, Vol. 12(2), 227-240.—Investigates whether phonetic symbolism is disseminated universally in all natural languages or whether a specific appearance in definite languages occurs. The structural, semantic, and phonetic peculiarities of various languages, including linguistic sources, are discussed. The importance of phonetic symbolism in the development of psycholinguistics is stressed. (French & English summaries) (15 ref.)—B. A. Stanton.

8170. Rosentsveig, V. Yu. (Ed.) *Mashinnyi perevod i prikladnaya lingvistika*. [Machine translation and applied linguistics.] Moscow, USSR: USSR Ministry of Higher & Secondary Specialized Education, 1969. 239 p.—Presents a collection of 9 articles, which describe the semantics of natural language, oriented toward the automated solution of a number of applied problems. A supplementary bibliography of recent works on machine translation and applied linguistics is included. The collection constitutes Issue 11 of *Trudy Instituta inostrannykh yazykov imeni Morisa Toreza* [Transactions of the Thorez Institute of Foreign Languages].—I. D. London.

[Sound-chains in the languages of the world.] Moscow, USSR: Nauka, 1969. 188 p.—Presents an analysis of sound-chains in different languages, leading to the development of methods which enable the identification of linguistic units in unknown languages.—I. D. London.

8172. Smith, Philip T. (Oxford U., England) *Two experiments with artificial languages*. *Quarterly Journal of Experimental Psychology*, 1970(Nov), Vol. 22(4), 583-591.—Reports 2 experiments where 36 and 72

Ss, respectively, learned simple artificial languages which contained synonyms, i.e., there were 2 equally correct verbal responses paired with each "referent" in the language: "referents" were simple visual patterns. In Exp. I (a memory task), Ss performed better with material of low auditory discriminability than with material of high auditory discriminability when they used 1 synonym of each pair more often than the other; the reverse was the case when they used each synonym equally often. In Exp. II (a 2-person communication task with a noisy channel), the degree to which pairs of Ss tended to use the same synonym for the same meaning was found to be nonmonotonic with the noise level in the communication channel: Ss tended to use the same synonyms for moderately high noise and very low noise more often than they did for very high and moderately low noise. The concept of decision cost is used to explain these results. Decision cost is a complex function both of discriminability and of response bias, and it is proposed that changes in decision cost in response to changes in response bias are responsible for results. (17 ref.)—Journal abstract.

8173. Snyder, Frank W. & Wiggins, Nancy. (Bell Telephone Lab., Holmdel, N.J.) *Affective meaning systems: A multivariate approach*. *Multivariate Behavioral Research*, 1970(Oct), Vol. 5(4), 453-468.—Applied a 3-mode factor analysis to the semantic differential ratings by 100 Ss of 20 concepts on 76 bipolar adjectival scales. 4 scale factors, 5 concept factors, and 2 S factors emerged from the analysis. On the basis of the interrelationships among factors it is concluded that different types of Ss tend to utilize the basic scalar dimensions of meaning in different ways when applying these scales across concepts. This application of scale dimensions varied with the class of concept being rated. (31 ref.)—Journal abstract.

8174. Vereshchagin, E. M. *Psikhologicheskaya i metodicheskaya kharakteristika dvuyazychiya (bilingvizma)*. [The psychological and methods aspects of bilingualism.] Moscow, USSR: Moscow U., 1969. 160 p.—Presents a psycho- and sociolinguistic analysis of bilingualism.—I. D. London.

Psycholinguistics

8175. Hakes, David T. & Foss, Donald J. (U. Texas) *Decision processes during sentence comprehension: Effects of surface structure reconsidered*. *Perception & Psychophysics*, 1970(Dec), Vol. 8(6), 413-416.—Investigated the usefulness of relative pronouns as cues to the deep structure underlying self-embedded (SE) sentences. At the same time, the relative sensitivity of 2 measures of sentence-comprehension difficulty—paraphrasing and phoneme monitoring—were compared. 40 undergraduates heard SE sentences, $\frac{1}{2}$ of which had the relative pronouns deleted. The presence or absence of the relative pronouns in a particular sentence was counterbalanced across groups. Ss also heard right-branching sentences. It was found that presence of the relative pronouns led to significantly faster phoneme monitoring times and to marginally better paraphrasing (i.e., better comprehension) in the SE sentences. It is concluded that relative pronouns are effective cues, and that the phoneme monitoring technique is a better index of comprehension difficulty than the paraphrasing technique. Reasons for previous experimental discrepancies are discussed.—Journal abstract.

AESTHETICS

8177. ———. **Bibliography for 1968.** *Literature & Psychology*, 1968, Vol. 20(4), 141-217.

8178. Alexander, Charlotte. (New York U.) **The "stink" of reality: Mothers and whores in James Baldwin's fiction.** *Literature & Psychology*, 1968, Vol. 18(1), 9-26.—Suggests that in James Baldwin's fiction physical intimacy is the means to emotional fulfillment, but with it there is always risk and mundanity, a "stink" of reality which results from a loss of purity, a loss of the idealized image. His characters reveal an unconscious conviction that women are either mothers or whores, and the imagery "strongly depicting a kind of sexual attraction which in early experiences often threatens, and which can later lead to homosexuality, or inordinate fear of homosexuality, or unreasonable fear of and distaste for females..."—S. Knapp.

8179. Boldrini, Pieragiuseppina. (U. Turin, Graduate School of Psychology, Psycho-Pedagogy, & Pedagogy, Italy) **Rapporti tra emozione e significato nella musica con particolare riferimento alla teoria strutturalistica di Leonard B. Meyer.** [The relationships between emotion and meaning in music with particular reference to the structuralistic theory of Leonard B. Meyer.] *Rivista di Psicologia Sociale e Archivio Italiano di Psicologia Generale e del Lavoro*, 1970(Jan), Vol. 37(1), 83-97.—Reviews the structural theory of L. B. Meyer on the relationships between emotion and meaning in music from the viewpoint of Gestalt principles. Considerable agreement was found between the 2 theories. (French & English summaries)—L. L'Abate.

8180. Dörner, Dietrich. (Christian Albrechts U., Inst. of Psychology, Kiel, W. Germany) **Eine Informations-theoretische Methode zur Bestimmung der ästhetischen Wirkung von Flächenmustern.** [An information analytic method to estimate the esthetic effect of pictures.] *Psychologische Forschung*, 1970(Sep), Vol. 33(4), 345-355.—Shows "that multivariate information analysis can be used to separate pictures regarded as nice from pictures regarded as ugly. A picture may be considered as a set of picture elements. Each picture element can be classified with regard to 3 variables, namely 'vertical position,' 'horizontal position' and color tone." The statistical relations between these variables are characterized by multivariate information analysis which results in 2 parameters. These parameters are the interaction between the variables and a balance coefficient for the variables "vertical" and "horizontal-position." In respect to these parameters, pictures, which are regarded as nice by human Ss, are separable from ugly pictures. Nice pictures show significantly higher interactions and lower balance coefficients than ugly ones. The dispersion of interactions and balance coefficients is lower at nice pictures."—R. Gunter.

8181. Edenbaum, Robert I. (Temple U.) **"Babylon revisited": A psychological note on F. Scott Fitzgerald.** *Literature & Psychology*, 1968, Vol. 18(1), 27-29.—Discusses F. S. Fitzgerald's story "Babylon Revisited," as an unconscious attempt by Fitzgerald to mask his guilt for what he insisted was his role in his wife's illness. A detail of the story which concerns the

omission of an explanation of how the characters of Lorrain and Dunc obtained Peter's address is discussed as a manifestation of Fitzgerald's unconscious self-destructive impulse.—M. Maney.

8182. Hoyle, James F. (Oakland U.) **Sylvia Plath: A poetry of suicidal mania.** *Literature & Psychology*, 1968, Vol. 18(4), 187-203.—Demonstrates the significant relationship between manic excitement and certain symbolic aspects of the imagery in the poetry of Sylvia Plath. Particular emphasis is placed on the poem "Lady Lazarus" in which the poet describes 3 manic depressive attacks. It is suggested that her poetry will interest the psychological critic since it reflects her suicidal mania and suggests her later suicide.—B. A. Stanton.

8183. Laszlo, Ervin. (State U. New York, Geneseo) **Fostering musical talent.** *Journal of Aesthetic Education*, 1969(Jan), Vol. 3(1), 55-67.—Examines aesthetic education in music and attempts to determine what musical talent is. Talent in the listener, composer, and performer is discussed. It is concluded that it is the task of music education to guide the student in the discovery of music as a means to express feeling. "The technical informative aspects of musical education are necessary, but... subsidiary to the aesthetic factor."—G. Steele.

8184. Sandberg, A. (Norwalk Community Coll.) **Erotic patterns in "The Paradise of Bachelors and the Tartarus of Maids."** *Literature & Psychology*, 1968, Vol. 18(1), 2-8.—Analyzes this diptych by H. Melville to offer support for W. B. Stein's interpretation of the story which classifies it as "an exploration of impotency, a portrayal of a man retreating to an all male childhood to avoid confrontation with heterosexual manhood."—M. Maney.

8185. Schreiber, Annette. (Long Island U.) **The myth in Charlotte Bronte.** *Literature & Psychology*, 1968, Vol. 17(1), 48-67.—Traces and interprets the central theme of Charlotte Bronte's fiction as "the destructive and self-destructive fantasy of the neurotic women-protagonists." It is proposed that, through this theme Bronte accomplished "something unique and brilliant with the novel form." She "developed a psychic allegory that allowed her to record the stream of unconsciousness contrapuntally with the consciousness of the emotionally deprived and alienated woman." It is concluded that future analysis of her novels will reveal her "not only as a brilliant innovator within the Gothic tradition, but a direct forerunner of many modern techniques, insights and novelists..."—M. Maney.

8186. Siegel, Paul N. (Long Island U.) **"Miss Jessel": Mirror image of the governess.** *Literature & Psychology*, 1968, Vol. 18(1), 30-38.—Suggests that critical analyses of Henry James' *The Turn of the Screw* have thus far missed a most important fact, "the fact that in each of 4 appearances of the apparitional Miss Jessel, she faithfully and unfailingly mirrors the actions of the governess." This fact is discussed as proof that the hallucinationist reading of this novel "is no critical aberration or irresponsible fancy, no hallucination of the critics themselves. It is a reading which itself the text is contrived to suggest." It is further suggested that both the apparitionist and the hallucinationist readings are valid, and that this is purposeful ambiguity which is essential to the novel's effect of terror produced by not knowing what is shadow and what is reality.—M. Maney.

8187. Vol'kenshtein, M. **Stikhi kak slozhnaya informatsionnaya sistema.** [Poetry as a complex informational system.] *Nauka i Zhizn'*, 1970, Vol. 37(1),

72-78.—Argues that the informational content of a poem immeasurably transcends the sum of the information included in its separate aspects. A "holistic informational system" is involved, where the informational content of the poem includes new information, emerging under its influence in the consciousness of the receptor.—I. D. London.

8188. Weiss, Aureliu. (Tufts U.) **Aesthetic prejudices and the perception of ideas: An educational problem.** *Journal of Aesthetic Education*, 1969(Jan), Vol. 3(1), 79-84.—Presents examples from the field of theatrical aesthetics to illustrate the power of attributing to ideas "a significance which goes beyond the intention of those who formulated them," thus producing unfounded prejudices which "can be erected into sacrosanct principles and end by shackling the free inspiration of writers."

8189. Wood, Theodore E. **Thoughts on the teaching of music.** *Journal of Aesthetic Education*, 1969(Jan), Vol. 3(1), 93-105.—Examines "the current situation in serious music" and postulates that modern "experimental music fails to communicate" because of a lack of "notes in rationally meaningful patterns." It is concluded that music education would improve aesthetic judgment.

SMOKING & DRUG & ALCOHOL USE

8190. ———. **Control of the stimulant addiction problem.** *Medical Journal of Australia*, 1969(Nov), Vol. 2(21), 1036-1037.

8191. Cahalan, Don; Cisin, Ira H., & Crossley, Helen M. **American drinking practices: A national study of drinking behavior and attitudes.** *Monographs of the Rutgers Center of Alcohol Studies*, 1969, No. 6, 260 p.

8192. Casse, Robert M. (Parsons Coll.) **Use of a "freak out" control center.** *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 403-408.—Reports the rationale and initial results of a campus drop-in center for college students with drug problems. Outlined specifically are the center's policy on drugs, hospitalization procedure, staff and facilities, and supportive therapy techniques. Initial findings include the elimination of hepatitis and freak outs, 2 common symptoms of drug abuse. It is reported that the program has also been effective in combating the problem of a hallucinogen drug crisis and generally in sustaining human life. The establishment of a firm philosophical basis and the availability of professionals interested in cooperating in such an endeavor are some of the major prerequisites for the development of such a program.—R. H. Mueller.

8193. Kanner, Mildred E. & Dupong, William G. (New York U., Medical Center) **Alcohol problems: Study by industrial medical department.** *New York State Journal of Medicine*, 1969(Dec), Vol. 69(24), 3105-3110.—Describes work with 300 employees of a large company who had problems with alcohol. Each employee in this group received a medical work-up, facts about the immediate and long-term effects of alcohol, specific advice, and repeated counseling with follow-up visits to the medical department. The evolution of this program and the procedure followed in the medical department are described. An 80.3% rehabilitation figure is cited and the cooperation and help from other sources, e.g., AA, is acknowledged. It is noted that the financial investment of the company is paying dividends through improvement in quantity and quality of work, decreased

accident hazard, and prevention of premature retirement of skilled employees.—M. Maney.

8194. Kuehn, John L. (Louisiana State U.) **The student drug user and his family.** *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 409-413.—A review of 41 drug-related cases revealed relevant information regarding drug users and their families. The major traits of drug users include the tendency to live excessively in the present, an excessively passive and reactive position in interpersonal relationships, serious cognitive difficulties, inexplicable depression, study difficulties not attributable to reality problems or difficulties in the environment, unrewarding sexual behavior, repression and rationalization, and intellectualization and isolation. It is suggested that the cause of the problems is an arrested state of psychosocial development which appears to be related to the "alienated student syndrome" and the fact that family difficulties are commonly expressed as the problem area for drug users. Several suggestions are provided for dealing with drug users in the counseling situation.—R. H. Mueller.

8195. Wieder, Herbert & Kaplan, Eugene H. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Drug use in adolescents: Psychodynamic meaning and pharmacogenic effect.** *Psychoanalytic Study of the Child*, 1969, Vol. 24, 399-431.

PERSONALITY

8196. Ching, Alvin W. (U. Minnesota) **The scientific explanation of moral behavior.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1531-1532.

8197. Medlicott, R. W. (Otago U., Medical School, Dunedin, New Zealand.) **An examination of the necessity for a concept of evil: Some aspects of evil as a form of perversion.** *British Journal of Medical Psychology*, 1970(Sep), Vol. 43(3), 271-280.—Examines the religiophilosophical background of good and evil and the attitudes towards good and evil in the optimistic and pessimistic views of life, and presents evidence that there is a driven destructiveness with common features which embraces many aspects of what has been termed evil. This driven destructiveness ranks as a serious form of perversion. Fictional, historical, and clinical examples of evil as a perversion, are presented. (22 ref.)—*Author summary.*

8198. Shainess, Natalie. (Columbia U., Coll. of Physicians & Surgeons) **Is there a separate feminine psychology?** *New York State Journal of Medicine*, 1970(Dec), Vol. 70(4), 3007-3009.—Responds to questions raised by women's liberation groups and to current statements that there are no psychological differences between the sexes. Freud's theories about women are outlined with emphasis on penis envy, narcissism, masochism, and passivity. Subsequent challenges to these theories by E. Jones, K. Horney, and C. Thompson are mentioned. However, it is concluded that there are distinct psychological differences between the sexes. Men are actively penetrating and women are receptive, but receptivity is not to be equated with passivity; it is an "active and assertive expression of the mastery of her own life."—S. Knapp.

8199. Sinha, T. C. **On aloneness.** *Samiksa*, 1969, Vol. 23(1), 1-8.—Explores the sense of and psychological features of aloneness in relation to its characteristic

features in psychoses, psychoneuroses, and "normal people," and as a mechanism of ego adjustment on the part of the child separated from its mother. Such reactive or negative type aloneness is contrasted with a positive type in which "the ego is in a restful and calm state having no reactive functions.... In such conflict-free state of mind, the ego, though temporarily withdrawn from all its various functions, becomes pregnant with immense potentialities and possibilities of concentrated creativeness."—*T. N. Webster.*

PERSONALITY TRAITS & PROCESSES

8200. Angelini, Arrigo L., Bitencourt Lomonaco, José F., & Rosamilha, Nelson. (São Paulo, Brazil) **Motivo de realização e desenvolvimento econômico.** [Motivation for achievement and economic development.] *Revista Interamericana de Psicología*, 1970(Mar), Vol. 4(1), 33-41.—Studied 494 male and female adolescents 12-18 yr. of age who lived in 4 regions of Brazil which were characterized by different stages of industrialization. Using projective techniques and methods established by D. C. McClelland, a correlation was found between motivation for achievement and degree of industrialization of the Ss' environs. Male and female Ss were evaluated separately. It was generally observed that a higher motivation for achievement is found in areas which are more advanced industrially. However, no cause and effect relationships were speculated. (English & Spanish summaries)—*P. Hertzberg.*
8201. Biller, Henry B. & Barry, William. (U. Rhode Island) **Sex-role patterns, paternal similarity, and personality adjustment in college males.** *Developmental Psychology*, 1971(Jan), Vol. 4(1, Pt. 1), 107.
8202. Farley, Frank H. (U. Wisconsin) **Further investigation of the two personae of extraversion.** *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 377-379.—Reports a study to (a) cross-validate the relationship between sociability and impulsivity-reflectiveness, and between each of these and adjustment; and (b) determine the relationship of sociability and impulsiveness to dissimulation and age. 290 Ss were administered the Eysenck Personality Inventory which was scored for impulsiveness, sociability, neuroticism, and lie factors. Results indicate that (a) sociability and impulsivity showed an overall positive correlation, but lower than that reported by S. B. Eysenck and H. J. Eysenck (see PA, Vol. 38:916); (b) impulsiveness was negligibly related to adjustment; (c) impulsiveness was more susceptible to dissimulation than sociability, and (d) the "2 faces of extraversion" were not strongly a function of age.—*P. McMillan.*
8203. Fletcher, R. & Dowell, L. (Texas A & M U.) **Selected personality characteristics of high school athletes and nonathletes.** *Journal of Psychology*, 1971(Jan), Vol. 77(1), 39-41.—Data for this study were obtained from 950 male college freshmen. The measuring instruments used were the EPPS and an Information Check List. Differences in personality traits between athletes and nonathletes were determined by use of the t-test. Results from these instruments indicate that athletes tend to score higher on the traits dominance and aggression than do nonathletes, while nonathletes scored higher in the personality trait order than the athletes.—*Author abstract.*
8204. Green, Jane N. (Personnel Selection Analysts, Minneapolis, Minn.) **The unity of the self-image.** *Individual Psychologist*, 1970(May), Vol. 7(1), 3-7.—"Until the self-concept is known, the true goals of the person cannot be understood.... A recognizable personality implies consistency of behavior.... While changing situations bring new goals, the organization of the unified self consistently selects that direction of the goal which it will pursue. The striving for unified inner and outer achievement is constant.... To say that an individual is inconsistent is a contradiction, for while the environment may change, under normal conditions the person is consistently himself."—*A. R. Howard.*
8205. Hampton, John D. (Oklahoma State U.) **Intolerance of ambiguity: A coping mechanism or mode of evaluation?** *Revista Interamericana de Psicología*, 1970(Mar), Vol. 4(1), 43-49.—In an effort to establish a criterion for Frenkel-Brunswick's postulated variable "intolerance of ambiguity," 322 students of both sexes in 3 age groups consisting of 3 ethnic classifications were administered 2 measures of intolerance of ambiguity and a modified California F Scale. Ambiguity tolerance was investigated both as a coping mechanism and as a mode of evaluation. With 1 exception, neither test correlated with the F Scale refuting the postulated construct validity of intolerance of ambiguity with authoritarianism. Neither tests of ambiguity tolerance correlated at any of the age levels. Reliabilities for the coping measure at all age levels were acceptably high; however, the reliabilities for the other measures were quite low. Results suggest that ambiguity tolerance is behaviorally manifested as a coping mechanism and is not a function of authoritarianism. (Spanish & Portuguese summaries) (21 ref.)—*Journal abstract.*
8206. Levitov, N. D. **Psikhologiya kharaktera.** [Psychology of character. (3rd ed.)] Moscow, USSR: Prosveshchenie, 1969. 424 p.—*I. D. London.*
8207. Muñoz, Leonardo; St-Jean, Heliette, & Marconi, Juan. **Sugestibilidad al dormir: Relación con sugestibilidad primaria y secundaria y otros rasgos de personalidad.** [Sleep suggestibility: Relationship with primary and secondary suggestibility and other personality traits.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Mar), Vol. 16(1), 45-52.—30 Ss were given the Sleep Suggestibility Test (SST) and their performance compared to a number of tests. It was found that sleep suggestibility correlates positively with IQ, last yr. of school, and the Body Sway Test. Ss who responded positively to the SST showed a greater response to a Release Test when a relaxing effect was suggested, as compared to the response without any suggestion of relaxation. SST was not found to be related to secondary suggestibility tests, the MPI, and Sears' Self Reference Questionnaire. The relationship between sleep suggestibility and hypnosis suggestibility is discussed.—*English summary.*
8208. Sherrill, David & Salisbury, J. L. (Syracuse U.) **Manifest anxiety, extraversion, and neuroticism: A factor-analytic solution.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 19-21.—Intercorrelated item responses from 241 undergraduates, using the 20-item Manifest Anxiety Scale and the 6-item Extraversion and Neuroticism scales (each modified to expand the traditional dichotomous response alternatives). The resultant matrix was transformed to a matrix of covariances and subjected to image analysis. A series of factor-analytic solutions based on item data supports reported correlations among the 3 scales. Manifest anxiety and neuroticism were found to be largely

confounded and both to be factorially independent of extroversion.—*Journal abstract.*

8209. **Sinha, T. C. Observations on anxiety.** *Samiksha*, 1968, Vol. 22(4), 160-166.—Anxiety results (a) when apprehension of danger, etc., is considered by the infantile, strongly narcissistic ego to be aggressive acts by external agencies, e.g., luck, fate, God, etc., against the sufferer; and (b) when the amount of aggression is considered unbearable or unacceptable by the ego. When pain, loss, etc., are unavoidable or unremediable, however, the ego diverts its attention from suffering to an expectation of an ensuing good, thus minimizing pain and holding pleasure as the final end. 2 cases are presented of anxiety produced by apprehension of the future after suffering misfortunes. The Ss believed that God had punished them and would punish them further; they remained anxious until they accepted that if more aggression came they could not effectively resist it. It is suggested that a life free of anxiety, a state similar to that claimed by the Yogis, is theoretically possible.—*T. N. Webster.*

8211. **Taft, R. (Monash U., Melbourne, Australia) A note on the characteristics of the members of Mensa, a potential subject pool.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 107-111.—Conducted a questionnaire study of the characteristics of 159 male and 57 female members (mean age, 28) of the Australian branch of the international Mensa organization which requires a high performance on an intelligence test for entry. Data indicate that members were more creative, imaginative, unconventional, and less practical than a control group, and tended to be earlier born, and to come from less happy and harmonious family backgrounds than controls. The question is discussed of whether the characteristics found for Mensa members are related to their high intelligence or to the fact that they represent a group of persons who have voluntarily joined this exclusive group. A combination of both these factors seems to be the most likely explanation.—*Author abstract.*

(Catholic U., Medical School, Rome, Italy) Fattori psicodinamici dell'aggressività.** [Psychodynamic factors of aggressiveness.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1968(Sep), Vol. 29(5-6), 507-528.—After reviewing neurophysiological, biochemical, and psychoanalytic perspectives on aggression, a theoretical synthesis of

dynamic aggressivity is presented, according to the viewpoints of Erikson, Mailloux, Hartmann, and the experimental contributions of the author and his collaborators.—*L. L'Abate.*

8216. **Dembroski, Betty G. & Johnson, Dale L. (Florida Presbyterian Coll.) Dogmatism and attitudes toward adoption.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 788-792.—Related M. Rokeach's notion of dogmatism, viewed as a system or network of beliefs and attitudes, to the area of adoption attitudes. Rokeach's Dogmatism Scale and an adoption attitude scale were administered to 113 undergraduates. Hypotheses that dogmatism would be positively related to intolerant attitudes toward adoption and areas related to adoption were almost wholly supported for the 61 males in the sample, but not the females. Results suggest that the emphasis on the maternal aspects of the feminine role in our society makes attitudes toward adoption an exception to Rokeach's theory of dogmatism.—*Journal abstract.*

8217. **Fischer, Edward H., Herschberger, Austin C., & Winer, David. (Connecticut Valley Hosp., Middletown, Conn.) The verbal reinforcement technique in personality research.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 79-89.—Studied 5 variables which theoretically relate to behavior under verbal reinforcement: self-esteem, task-involvement, E (role) difference, birth order, and family size. 2 experiments used 120 male undergraduates, naive Es, and controlled against informational discrepancy between reinforcement conditions. Results indicate that (a) negative reinforcement produced greater performance increments than positive reinforcement or nonevaluation, suggesting a psychological distinction between criticism and praise; (b) low self-esteem Ss tended to improve more with criticism than high self-esteem Ss; and (c) persons from small families responded more to evaluation and specifically to praise than large family Ss. Task-involvement, E, birth order, and social class variables showed no main effects and did not interact with verbal reinforcement. (27 ref.)—*Journal summary.*

8218. **Hekmat, Hamid. (Wisconsin State U., Stevens Point) Extraversion, neuroticism, and verbal conditioning of affective self-disclosures.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 64-69.—Examined the effects of neuroticism and extroversion in verbal conditioning of affective self-disclosures in 50 undergraduates on the basis of their scores on Eysenck's Personality Inventory. Ss were assigned to 4 experimental groups: neurotic-extroverts, stable-extroverts, neurotic introverts, stable-introverts, and a control group. Ss in experimental groups were reinforced with "good" for verbalization of affective self-disclosures. Controls received no reinforcement. Results indicate that introversion, and not neuroticism, facilitated conditioning processes. Neuroticism, however, did not interact significantly with extroversion on the conditioning of affective self-disclosures. Results also show that introverted Ss were more resistant to extinction than extroverted ones. Neuroticism, however, neither interacted with extroversion nor influenced extinction processes significantly. (15 ref.)—*Journal abstract.*

8219. **Izzett, Richard R. (State University Coll. New York, Oswego) Authoritarianism and attitudes toward the Vietnam war as reflected in behavioral and self-report measures.** *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 145-148.—Tested the

hypothesis that authoritarianism as measured by the California F Scale would be related to both behavioral and self-report measures of Ss' attitudes toward United States involvement in the Vietnam war. The F Scale and a 6-statement self-report questionnaire pertaining to the Vietnam war were administered to 131 undergraduates. 65 Ss actively demonstrated against United States involvement in the Vietnam war by not attending class on the day of the October 15, 1969 moratorium on the Vietnam war. In support of the hypothesis, these 65 Ss had significantly lower F-scale scores and had stronger anti-Vietnam war attitudes, as reflected in the self-report questionnaire.—*Journal abstract.*

8220. Kořaliková, Veronika. (Comenius U., Bratislava, Czechoslovakia) **Obráz o sebe v regulácii ľudského správania.** [Self-image in the regulation of human behavior.] *Psychologica: Sborník Filozofickej Fakulty, U. Komenského, Bratislava*, 1967, Vol. 18(7), 3-18.—Introduced the opinion that development and education make the image of oneself acquire a more important role in the regulation of behavior to explain forms of seemingly nonhomeostatic behavior which preserve or gain equilibrium, supporting *raison d'être* of the homeostatic theory in psychology. (Russian & German summaries) (26 ref.)—*English summary.*

8221. Petrò, Carlo. (Province of Milano Psychiatric Services, Italy) **Adgredior-aggressività.** [Adgredior-aggressiveness.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1968(Sep), Vol. 29(5-6), 547-556.—Reviews the contribution of Jung to the study of aggressive behavior.—*L. L'Abate.*

8222. Sager, Eric B. & Ferguson, Leonard W. (Ohio U.) **Person perception as a function of perceiver's position on a cold-warm dimension.** *Psychological Record*, 1970(Sum), Vol. 20(3), 321-325.—This article is 1 of a series by L. W. Ferguson, et. al. describing person-perception data secured by 377 simulated employment interviews. It is demonstrated that perception of others is a function of O's position on a cold-warm personality dimension. In describing others after an interview, 70 warm interviewers made the most frequent use of warm-related adjectives; 200 "intermediate" interviewers, the 2nd-most frequent; and 107 "cold" interviewers, the least.—*Journal abstract.*

8223. Scott, J. P. (Bowling Green State U., Center for Research in Social Behavior) **Biology and human aggression.** *American Journal of Orthopsychiatry*, 1970(Jul), Vol. 40(4), 568-576.—Defines agonistic behavior as a system of related behavior patterns having the common function of adaptation to situations of conflict between members of the same species. It is felt that biological bases for this kind of behavior do exist for the various species. It is equally probable, however, that because of man's unique genetic composition no direct analogies from any other species to man are justified. (34 ref.)—*Journal abstract.*

8224. Singh, Narayan P. (Delhi U., India) **Risk-taking and anxiety among successful and unsuccessful, traditional and progressive agricultural entrepreneurs of Delhi.** *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 301-308.—Randomly selected 80 successful and unsuccessful agricultural entrepreneurs in a study using 4 cells of a 2 × 2 factorial design, with 20 Ss in each cell. An adapted Hindi version of Bendig's Pittsburg revision of the MA scale for measuring anxiety and Kogan and Wallach's choice-dilemma procedure for measuring

risk-taking were administered to each S. Findings reveal that traditional Ss, whether successful or unsuccessful, exhibited higher anxiety scores and more extreme (high or low) risk-taking scores than progressive Ss, who showed moderate risk-taking scores. In the case of successful entrepreneurs, a positive nonsignificant trend of relationship between anxiety and risk-taking scores was obtained, but a significant inverse relationship was found in the case of unsuccessful entrepreneurs and successful-unsuccessful combined. (17 ref.)—*Journal abstract.*

8225. Sinha, T. C. **Further observations on aggression.** *Samiksa*, 1968, Vol. 22(3), 110-117.—Discusses the dynamics of certain forms of aggression, e.g., (a) retaliation against verbal attack, (b) reaction to jealousy, (c) reaction to refusal by a mother of a child's desire, and (d) reaction to frustration or failure in problem solving or work. The cause of aggressive reaction is seen as a retaliation against insult, or as a reaction to either a real or imagined aggression. Any expression of aggression, in trying to overcome resistance against wish fulfillment, is viewed as a reaction product.—*T. N. Webster.*

8226. Sinha, T. C. **Notes on aggression.** *Samiksa*, 1968, Vol. 22(2), 41-49.—Defines aggression as the expression of a particular type of wish or combination of wishes, directed either to destroy an S or to thwart any particular tendency in an S by force, or to modify or try to bring a situation under control by use of physical or mental force, e.g., physical punishment or mental disapproval of a child for his actions. Methods used to gain certain ends may be aggressive, even though the purpose of the acts is beneficial. Acts of aggression are seen in most mental disorders, e.g., suicide. Though aggression is basic and can be passively expressed, as in Ghandi's nonviolent movement, it is mostly used, normally or pathologically, in a reactive manner. While aggression, including unconscious aggression, plays an important role in most daily life situations, its objective measurement is difficult. For proper assessment of aggression the subjective attitude of the individual concerned must be examined. Considering the influence of aggression and counter-aggression at an early stage of a child's life, "the magnitude of the aggression of the reality apprehended by the child's ego and the basic ego strength are the 2 main factors which determine the primary reaction pattern of the ego."—*T. N. Webster.*

INTELLIGENCE

8228. Bukvić, Aleksandar. **IQ norme za verbalnu seriju B. Stevanović.** [IQ norms for B. Stevanović's verbal series.] *Psihologija*, 1969(Sep), Vol. 2(2), 480-482.—Established that B. Stevanović's Verbal Series is composed of a test, the factor composition of which is defined by a single factor, and specified IQ norms for the population of high school graduates in Serbia, on a sample of 400 Ss. Norms are more rigorous than they would have been if they were established on a more representative sample. The over-all achievement of Ss on the Verbal Series can be expressed in terms of IQ values.—*English summary.*

8229. Halliday, T. C. **The intelligence enterprise.**

Delta, Massey U., New Zealand, 1970(May), No. 6, 10-15.—Proposes a model for approaching the problems in the study of intelligence, and emphasizes the need for a general theory of intelligence. The model is based on 4 questions: (a) Do people behave differently to others on certain performances? (b) What behavioral differences exist? (c) How do such differences vary? And (d) why are there such differences? The activities and methodological problems resulting from such questions are discussed. It is suggested that there is a need for a holistic approach which meets the following criteria: the theory should be (a) conceptually refined, (b) logically consistent, (c) verifiable, (d) falsifiable, and (e) generalizable.—R. Wiltz.

8230. Klingelhofer, E. L. (Sacramento State Coll.) **A note on language, school, and examiner effects on the performance of Tanzanian school children on Raven's Standard Progressive Matrices Test.** *Journal of Social Psychology, 1971(Feb), Vol. 83(1), 145-146.*—Reports that performance of Standard VII, (7th grade) children in 2 Tanzanian elementary schools on Raven's Standard Progressive Matrices Test was independent of language of administration (Swahili or English), school (urban or rural), or examiner effects.—*Author abstract.*

8231. Majumdar, P. K. **On aptitude tests: Classified type of test versus omnibus type of tests yielding multiple scores.** *Bulletin of the Council of Social & Psychological Research, Calcutta, 1968, No. 10-11, 16-21.*—Investigated the applicability and effectiveness of the omnibus type of assembled test battery in aptitude measurement. 2 matched groups of 75 Ss each were given Majumdar's Scholastic Aptitude Test. Group I took the test in subtest order; Group II was divided into 3 subgroups, 2 took the test in different subtest order and 1 took the test in omnibus form with the subtest items mixed and presented in order of difficulty. Results indicate that the "difficulty value of the sub-tests were to some extent functions of their positions in the test programme." The average difficulty of the omnibus type of test did not appear to differ from that of the other presentations. The advantages and disadvantages of both methods are discussed. It is concluded that the omnibus type is superior under certain conditions.—S. Knapp.

8232. McCall, Robert B. (Fels Research Inst., Yellow Springs, O.) **Intelligence quotient pattern over age: Comparisons among siblings and parent-child pairs.** *Science, 1970(Nov), Vol. 170(3958), 644-648.*—Compared 100 sibling and parent-child pairs with unrelated control pairs, matched for year of birth and parental education, to determine the relative heritability of the general level of IQ as opposed to that of the sequential pattern of IQ change over age (3-12 yr.). Data indicate greater similarity among related siblings relative to matched controls for general level than for pattern of IQ over age. Relationships between the IQs of children and that of their parents as children were not consistent across age.—*Journal abstract.*

8233. Ostijn, N. (Kon. Military School, Brussels, Belgium) **De invloed van de motivatie op de resultaten op de intelligentie-test "Progressive Matrices" van J. C. Raven.** [The influence of motivation on the results of the Progressive Matrices intelligence test of J. C. Raven.] *PMS: Tijdschrift voor Psycho-Medisch-Sociaal Werk, 1970, Vol. 16(3), 105-110.*—200 Belgian recruits who expressed an interest in receiving vocational guidance at the end of their military service were retested at that time. Their scores were compared with those

obtained at the time of their enlistment, when all recruits were tested. The mean score was 7.06 points higher on the 2nd occasion with a t of 15.28 ($p < .001$). It is suggested that the period of from 13-22 mo.; between the 2 examinations is too long to consider that memory of the earlier test, and discussion of difficult items could account for the improvement. Conversely, on the 2nd occasion the individuals were interested in an accurate assessment for the sake of being given individual advice.—S. G. Vandenberg.

8234. Palem, R. M. (Service de l'enfance inadaptée, Perpignan, France) **Réflexions sur l'intelligence, sa détérioration organique et leur mesure: Plaidoyer pour le quotient intellectuel verbal et les facteurs de caractère.** [Reflections on intelligence, its organic deterioration and assessment: Defense of verbal IQ and personality factors.] *Evolution Psychiatrique, 1970(Apr), Vol. 35(2), 453-463.*—Critically reviews the concepts of intelligence, deterioration, organicity, and verbal IQ, reiterating Chateau's stand against "the invasion of European psychology and psychopedagogy by American studies." Intelligence is seen as a value, to be included with "verbal thinking" (distinct from verbalism) in a scale of values, and the uneasiness arising from its measurement is due to the fact that "measurement of a value is an indecent and blasphemous act... a perversion of the spirit." A return to basics, continual criticism of tools, and a constant search for connections between clinical practice and neurophysiology (required for a rational approach to the problem of deterioration) necessitate rejection of intellectual consolation to prevent the formation of psychometric illusions. (English summary)—T. N. Webster.

8235. Spada, Hans F. (U. Vienna, Inst. of Psychology, Austria) **Intelligenztheorie und Intelligenzmessung.** [Theory and measurement of intelligence.] *Psychologische Beiträge, 1970, Vol. 12(1), 83-96.*—Delineates relationships between theory and measurement of intelligence and the possibilities of the application of probabilistic test theories. An analysis of 629 protocols of 3 intelligence tests shows that quantifications of intelligent behavior independent of population are possible on the basis of proportional or difference scales. Invariant intelligence dimensions are felt to exist. Tests scaled by Rasch's method generally meet the demands of classical quality criteria of test theory. This holds true in the case of power, and speed tests. (17 ref.)—*English summary.*

CREATIVITY

8237. Kline, James A. (U. Colorado) **Creativity: Product, person, potential and motivation.** *Dissertation Abstracts International, 1970(Sep), Vol. 31(3-B), 1520-1521.*

8238. Krogus, N. V. **O psikhologii shakhmatnogo tvorchestva.** [On the psychology of creativity in chess.] Moscow, USSR: Fizkul'tura i Sport, 1969. 96 p.—Presents anecdotal materials on the psychology of chess, involving problems of thinking, attention, and time limitation.—I. D. London.

8239. Weissman, Philip. **Special problems of creative personalities in family relations.** *Israel Annals of Psychiatry & Related Disciplines, 1969(Apr), Vol. 7(1),*

1-8.—Outlines some special psychological considerations of creative people, e.g., the artist's capacity to utilize a desynthesizing or dissociative function by which he can undo the established and create original solutions. With regard to the question of the artist's need for sublimation in order to create, it is suggested that he employs another capacity to neutralize libido and aggression which become usable for creative purposes. It is believed that this formulation clarifies the clinical dilemma in which many people are found to be functioning creatively, regardless of and in the absence of the process of sublimation. Psychobiographical and clinical evidence is presented to show the wide variations of object relationships in creative personalities. It is concluded that these are of great significance in therapeutic work with creative personalities—be it psychoanalytic therapy, psychotherapy or any therapy utilizing relations in the family.—*G. Steele.*

PERSONALITY MEASUREMENT

8240. Althouse, Richard H. (U. Wisconsin, Medical School) **A semantic differential investigation of sexually symbolic concepts: Freud and Jung.** *Journal of Projective Techniques & Personality Assessment*, 1970(Dec), Vol. 34(6), 507-512.—Masculine and feminine ratings, via the semantic differential, of various nouns hypothesized by Freud or Jung to represent masculine or feminine symbolism, were made by 67 male and 78 female undergraduates. 34 male and 34 female Ss received Freudian nouns; 33 male and 44 female Ss received Jungian nouns. While certain nouns were rated according to psychoanalytic theory, others were not. Some masculine concepts (nail file, balloon, noodle, bird) were rated feminine, and some feminine concepts (tunnel, trap door, box, case, garage, club, city, hill, cask, earth, whale, board, net) were rated masculine. Results suggest caution in accepting psychoanalytic criteria for sexual symbolism in the analysis of clinical material.—*Journal abstract.*

8241. Comrey, Andrew L. & Backer, Thomas E. (U. California, Los Angeles) **Construct validation of the Comrey Personality Scales.** *Multivariate Behavioral Research*, 1970(Oct), Vol. 5(4), 469-477.—Administered the Comrey Personality Scales, a personality test, and a biographical data inventory inquiring about past and present life circumstances to 209 undergraduates to investigate the construct validity of the Comrey Scales. Biographical data variables were correlated with scores on the 8 personality scales. Personality scale score estimates, based on examination of the respondents' biographical data responses, were also correlated with actual scale scores. The personality scales which received the best confirmation were social conformity vs. rebelliousness, and orderliness vs. lack of compulsion. Support for the construct validity of the other personality scales varied from moderate to negligible.—*Journal abstract.*

8242. Conde, V., Escribá, J. A., & Izquierdo, J. A. (U. Salamanca, Medical School, Spain) **Evaluación estadística y adaptación castellana de la escala autoaplicada para la depresión de Zung: I.** [Statistical evaluation and Spanish adaptation of Zung's Self-Rating Depression Scale: I.] *Archivos de Neurobiología*, 1970(Apr), Vol. 33(2), 185-206.—Tests the reliability and validity of some of the aspects of Zung's Self-Rating Depression Scale (SDS) results of 1965-1967, and

examines a 1968 sample of 300 males and 300 females of 14-60 yr. of age taken from 3 regions of Spain. Statistical results of the 17 graphs shown include: (a) a SDS mean of 45.6; (b) a standard deviation of 10 from total sample; (c) a mean SDS % of 44.2 for the male group; (d) a standard mean deviation of 9.1 for the male group; (e) a mean SDS % of 47 for the female group; and (f) a mean standard deviation of 10.6 for the female group. The difference between male and female means is statistically significant at the 1% level of confidence, and it is therefore proposed that sex is a variable that introduces important differences in the results.—*S. Maze.*

8243. Greif, Siegfried. (Freien U., Berlin, W. Germany) **Untersuchungen zur deutschen Übersetzung des 16 P.F.-Fragebogens.** [Investigation regarding the German translation of the 16 PF questionnaire.] *Psychologische Beiträge*, 1970, Vol. 12(2), 186-213.—Tested Form A of the authorized German translation of the 16 PF questionnaire using 415 16-24 yr. old Ss. Hints concerning Cattell's "suppressor structure" could not be found in this sample. The 16 scales can not be described as "functionally independent," but show a relatively high correlation. On the basis of the results of this investigation, it is concluded that Cattell's factors of 2nd order cannot be described as "factors of a higher order." (29 ref.)—*English abstract.*

8244. Jensen, John A. & Schmitt, John A. (Boston Coll., School of Education) **The influence of test title on test response.** *Journal of Educational Measurement*, 1970(Win), Vol. 7(4), 241-245.—Determined the extent to which responses to test items of the type frequently found in personality inventories would be influenced by the title associated with the test. The basic hypothesis was that Ss respond to the test title by developing a particular response set which will be reflected in the individual responses. An instrument was constructed and administered to 8 treatment groups totaling 294 undergraduates. Each administration differed primarily in the title each group's tests bore. The dependent variables were measures of the tendency to lie, respond defensively, answer carefully, and complete questions. Ss tended to lie and respond more defensively to titled tests than to a test having no title and administered under nonthreatening conditions. All other comparisons were not statistically significant.—*Journal abstract.*

8245. Lange, Donald E. (U. Victoria, British Columbia, Canada) **Validation of the orthogonal dimensions underlying the ICL and the octant constellations assumed to be their measure.** *Journal of Projective Techniques & Personality Assessment*, 1970(Dec), Vol. 34(6), 519-527.—Investigated validity of the Interpersonal Check Lists (ICL) octant constellations and underlying interpersonal dimensions by inferential design. 4 role-played videotapes were produced so that the interpersonal behavior of the main character would illustrate the 4 poles of the ICL's 2 bipolar dimensions. 218 undergraduates viewed 1 of 4 tapes and described the main character by using an ICL Form IV. Resulting profiles from Ss seeing the same tape were pooled to form 4 groups, then statistically compared. Results support the original formulations of R. LaForge and R. F. Suczek (see PA, Vol. 30:5990).—*Journal abstract.*

8246. Maly, Joachim. (Vienna U., Austria) **Anwendung eines probabilistischen Testmodells zur Analyse von Persönlichkeitsfragebogen.** [Development of a probabilistic test model and the analysis of personality questionnaires.] *Psychologische Beiträge*,

1970, Vol. 12(1), 97-104.—Analyzed subscales of the Freiburg Aggression Questionnaire concerning their 1-dimensionality by means of a stochastic test model. Out of 14 tests only 7 met the demands of the model assumption. Lacking 1-dimensionality seems to result from internal group differences of age, sex, intelligence, and social status. In such groups tests measure different things. Classical criteria and given answer tendencies seem to be responsible for the lack of 1-dimensionality.—*English summary.*

8247. Sells, S. B., Demaree, R. G., & Will, Donald P. (Texas Christian U.) **Dimensions of personality: I. Conjoint factor structure of Guilford and Cattell trait markers.** *Multivariate Behavioral Research*, 1970(Oct), Vol. 5(4), 391-422.—Reports a taxonomic investigation of personality based on a matrix of 600 personality questionnaire items represented equally by marker items derived from the personality trait systems developed by J. P. Guilford and R. B. Cattell. Ss were 2550 airmen. The factor structure of the total matrix, with particular concern for the relative contributions and relations of the 2 sources, is emphasized. The correlations among items, and the rotated factor results derived from them, have demonstrated that analysis at the item level is highly destructive to the factors previously assembled without adequate concern for their loadings in large matrices in which a wide range of factors is known to exist. Results indicate a need for reclassification of at least 400 of the 600 source items with respect to the factors for which they were represented as markers for inclusion in the study. (23 ref.)—*Journal abstract.*

8248. Stewart, L. H. (U. California, School of Education, Berkeley) **Relationships between interests and personality scores of occupation-oriented students.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 31-38.—Administered the Interest Assessment Scales and the Omnibus Personality Inventory to 2458 undergraduates enrolled in occupation-oriented curricula. Multivariate analytical procedure indicated high relationship between the 2 instruments. However, some of the findings raise questions about the wisdom of attempting to use interest and personality scales interchangeably. (17 ref.)—*Journal abstract.*

Inventories

8249. Colston, Malcolm A. **The E and N scales of the EPI: Some further Australian data.** *Australian Psychologist*, 1969(Jul), Vol. 4(1), 59-61.—In view of J. F. Richardson's (see PA, Vol. 42:12992) report that the correlations between the Extraversion (E) and Neuroticism (N) scales of Forms A and B of the Eysenck Personality Inventory (EPI) were significantly negative, and that there is a marked imbalance of questions in favor of the melancholic quadrant (contrary to claims of H. J. Eysenck and S. B. Eysenck that there is no significant correlation between E and N, and that the EPI items are distributed approximately evenly in the melancholic and choleric quadrants) analyzed the results of EPIs administered to 557 military recruits. Analysis shows the correlation between E and N was $-.005$, agreeing with Eysenck and Eysenck; however, neither Richardson's finding of imbalance of the quadrants, nor Eysenck and Eysenck's claim of even distribution of melancholic and choleric quadrants, were confirmed by this study.—*T. N. Webster.*

8250. Koller, K. M. & Castanos, J. **The Eysenck**

Personality Inventory: Australian experience with normal and abnormal groups. *Australian Psychologist*, 1969(Jul), Vol. 4(1), 48-53.—Administered form A of the Inventory (assessing neuroticism and extroversion) to Australian and British university students, student nurses, office workers, prisoners, hospitalized alcoholics, and mental patients (neurotic, depressed, and schizophrenic). Results show: (a) Australian students more extroverted, English students more neurotic; (b) Australian alcoholics more neurotic, but no significant difference in alcoholic groups as to extroversion; (c) no significant difference between student nurses, office workers, and depressive groups in either of the dimensions; (d) Australian neurotic groups more neurotic than British; and (e) Australian schizophrenics more neurotic, but no significant difference between schizophrenic groups' extroversion. Though Eysenck has suggested that 4 or more lie scores should invalidate the test, the percentage of tests which would be rejected in the various groups tested (mean lie score from 2.28-5.13) ranged from 22.40% of the university students to 73.31% of the depression groups. It is suggested that an item analysis of the responses to the lie questions be made in the normal population, and that this should be compared with the abnormal population in order to reveal any significant differences.—*T. N. Webster.*

8251. Palmer, Robert D. (Veterans Administration Hosp., Brooklyn, N.Y.) **Psychopathology and seasonal preferences: An aspect of temporal experience.** *Journal of Projective Techniques & Personality Assessment*, 1970(Dec), Vol. 34(6), 513-518.—Hypothesized that since seasonal changes serve to mark off the passage of time, one's feelings about the seasons can be viewed as a special case of one's attitudes toward time more generally, and as one point of entry into the individual's inner universe of experience. 55 male undergraduates rated the 4 seasons from best liked to least liked, and were administered the MMPI and 5 nonclinical scales. Results indicate that individuals differ in the feelings they invest in the seasonal context of their existence, and that these feelings are significantly influenced by the individual's emotional status. (17 ref.)—*Journal abstract.*

8252. Williams, Clive. (U. Queensland, Brisbane, Australia) **Meaningfulness of the Eysenck Personality Inventory Lie scale.** *Australian Psychologist*, 1969(Jul), Vol. 4(1), 54-58.—Compares results of the Eysenck Personality Inventory administered to 8 groups including Australian university students, Australian Army Personnel, and Ghanaian students, ranked in order of their mean Lie (L) scores and mean Neuroticism (N) scores, with a calculated rank order correlations (τ) between the 2 sets of ranks of $-.79$. With the Ghanaian group omitted, $\tau = .90$. Data are explained in terms of denial of aspects of experience by defensive persons, who therefore score low on N, while others, including uninhibited "normals," more frank and open to their experience, score high on N. Traditional use of the L scale is questioned and evidence suggested that N scores should not be interpreted without reference to L scores, while the value of a single cut-off point on the L scale to separate acceptable from unacceptable responses is considered of doubtful value.—*T. N. Webster.*

Projective Techniques

8253. Baker, Robert P. & King, Hollis H. (Presby-

terian-St. Luke's Hosp., Chicago, Ill.) **The relationship between the Repression-Sensitization scale and the Incomplete Sentences Blank.** *Journal of Projective Techniques & Personality Assessment*, 1970(Dec), Vol. 34(6), 492-496.—Prior research with the Repression-Sensitization (R-S) scale has isolated certain differential behavior patterns in Ss scoring at the extremes of the scale. Thus D. Byrne's formulation of the R-S scale hypothesized a curvilinear relationship between the R-S scale and psychological adjustment. However, other research suggests that the relationship may be linear. Using Rotter's Incomplete Sentence Blank, College Form (ISB), it was hypothesized that there would be a linear relationship between the R-S scale and ISB. 204 undergraduates took both the R-S scale and ISB. No significant sex differences were obtained. While the correlation between the R-S scale and ISB was significant ($r = .59, p < .01$), results did not prove linearity, but there is insufficient evidence to support any other kind of relationship. (22 ref.)—*Journal abstract*.

8254. Fischer, Gerhard H. & Spada, Hans F. (U. Vienna, Inst. of Psychology, Austria) **Die metrische Analyse eines projektiven Formdeutetests.** [The metric analysis of a projective form interpretation test.] *Psychologische Beiträge*, 1970, Vol. 12(1), 65-82.—Investigated the question of whether and in what way quantitative statements on personality traits can be made by means of results of form interpretation tests, on the basis of 305 Holtzman test protocols. The 1-dimensional test of G. Rasch helped to isolate those test variables which could be used for setting up dichotomies of answer categories which corresponded to the assumptions of the model. It is suggested that those scoring variables which do not meet the demands of the model be eliminated.—*English summary*.

8255. Jernigan, A. J. (Veterans Administration Hosp., Dallas, Tex.) **Judging whether a patient is white or black by his Draw-A-Person Test.** *Journal of Projective Techniques & Personality Assessment*, 1970(Dec), Vol. 34(6), 503-506.—Presented Draw-A-Person Test (DAP) protocols from 28 matched black and white adult male patients to 34 untrained and 17 trained judges who were asked to identify race of patient from his DAP. Average correct identification ranged from 53.8% (black judging black, not significant) to 62.9% (white judging white, $t = 6.43, p < .01$). White untrained judges were more accurate than black untrained judges ($t = 2.43, p < .05$). Black judges had more difficulty with black stimuli than with white stimuli, as did trained judges. The modest success achieved by both black and white judges adds minimal evidence to the body image hypothesis. Possible explanations are offered.—*Journal abstract*.

8256. Lunneborg, Patricia W. & Olch, Doris. (U. Washington, Bureau of Testing) **Sentence completion correlates of airline pilot attitude and proficiency.** *Journal of Projective Techniques & Personality Assessment*, 1970(Dec), Vol. 34(6), 497-502.—Correlated sentence completion scores for dependency, anxiety, and hostility with sentence completion measures of good flying attitude and omissions for 300 male airline pilot candidates. The scoring-by-example method used with the 1st 3 variables was highly reliable and avoided scoring overlap. All sentence completion scores were also correlated with 15 traditional measures of pilot qualification, e.g., mechanical information and signal RT. While the proficiency measures were generally unrelated to the projective measures, a good attitude towards flying

was positively associated with coping (not omitting sentence completion items) and the extreme suppression of anxiety and hostility under stress. Civilian airline pilots appear similar to military pilots in their exaggerated display of good judgment.—*Journal abstract*.

8257. Prola, Max. (York Coll., Div. of Counseling & Student Development, City U. New York) **A re-evaluation of the motor inhibition: Fantasy hypothesis.** *Journal of Projective Techniques & Personality Assessment*, 1970(Dec), Vol. 34(6), 477-483.—Because support for the hypothesis that motor inhibition stimulates fantasy is based entirely on changes in the Rorschach movement (M) response, the generality of the phenomenon is in doubt and was tested by observing the effect of restricted motility on TAT productions, scored for fantasy with the Transcendence Index. The influences of general activity level and daydreaming tendency also were studied, as well as the hypothesis that motor inhibition specifically affects only fantasy about movement. Ss were 60 male undergraduates. No change in movement fantasy, nonmovement fantasy, or total fantasy was found, suggesting that previous investigators may have overstated the case in inferring that total fantasy is stimulated by motor inhibition. Rather, some property specific to the M response may be involved, and some speculation about its nature is offered. (23 ref.)—*Journal abstract*.

8258. Starker, Steven & Goodenough, Donald R. **Effects of sleep state and method of awakening upon Thematic Apperception Test productions at arousal.** *Journal of Nervous & Mental Disease*, 1970(Mar), Vol. 150(3), 188-194.—Hypothesized that abrupt awakenings from REM sleep would yield more dreamlike stories than gradual awakenings from that state; that such abrupt/gradual differences would be exclusive to the REM stories; and that REM stories would be more dreamlike than NREM stories. 16 male undergraduates were paid to spend 1 night each at the sleep laboratory. Ss were awakened 4 times for TAT stories, twice from Stage-2 NREM sleep and twice from REM sleep. 1 awakening from each sleep state was abrupt, the other gradual. Stories were analyzed by 2 "blind" raters with respect to several content and structural variables. Results disclose that stories produced following NREM abrupt awakenings differed from all others in being less bizarre, emotional, imaginative, and negative in affective tone. This finding suggests that a carry-over of NREM characteristics was facilitated by proximity to that sleep state. No detectable carry-over effect from REM sleep was noted. Results indicate that the method-of-awakening differences observed in dream recall are not the result of an ability-to-report artifact.—*Journal abstract*.

Rorschach Test

8259. Draime, Jacques. (U. Louvain, Belgium) **Le test de Rorschach: Application: Problèmes de dépouillement.** [The Rorschach test: Administration: Problems of interpretation.] *Revue de Psychologie et de Sciences de l'Education*, 1970, Vol. 5(3), 317-341.—Discusses recommended standard procedures with respect to preparation of the material, psychological preparation, testing procedure, and drawing conclusions. The last 2 each deal with specific problems and specific examples are given.—*S. S. Marzolf*.

8260. Dudek, S. Z. (U. Montreal, Quebec, Canada)

The artist as a person: Generalizations based on Rorschach records of writers and painters. *Journal of Nervous & Mental Disease*, 1970(Mar), Vol. 150(3), 232-241.—Extends a former study by S. Z. Dudek (see PA, Vol. 43:14264) indicating that Rorschach records of 19 painters and 22 writers "present a picture consistent with the concept of the artist as possessing a high degree of imagination and a heightened capacity to regress 'in the service of the ego.'" The present study discusses personality characteristics of the artist based on a quantitative and qualitative analysis of the same Rorschach records. Characteristics evident from the analysis include originality, subjectivity and intensity of feeling, a highly intellectualized emotional vitality, responsiveness to inner needs, easy regression to more archaic ways of feeling and perceiving, desire for ego identity 1st through the act of creation and 2nd through being an artist, emphasis on spiritual values and a rejection of material ones, need for recognition as a special person, a desire to give birth to something new, a high degree of free-floating anxiety, "cathexis at the stage of oral aggression" (particularly for the writers), identification with the mother, and a deep sense (often unconscious) of suffering and anguish.—*P. McMillan*.

CLINICAL PSYCHOLOGY

8261. ———. **Digest of papers: Forty-seventh annual meeting American Orthopsychiatry Association, San Francisco, California—March 23-26, 1970.** *American Journal of Orthopsychiatry*, 1970(Mar), Vol. 40(2), 197-364.

8262. ———. **Neurophysiological and behavioral research in psychiatry.** *World Health Organization, Technical Report Series*, 1968, No. 381, 33 p.—Examines recent developments which have transformed the relationship between neurophysiology and psychiatry including: (a) the application of polygraphic techniques to the study of normal sleep and pathological alterations of consciousness, (b) the introduction of a wide range of psychopharmacological agents with profound effects on mental state and behavior, (c) the establishment of surgical procedures for the implantation of multiple indwelling electrodes in the human brain, and (d) the introduction of computer techniques in the analysis of data. The prospects for future research on the neurophysiological and behavioral aspects of mental disorders, with special attention to critical periods of development, learning techniques and primary prevention, sleep, high-risk groups, diagnosis and prognosis, and transcultural collaboration are examined. The value of a central agency to provide a clearing house for information is stressed. High priority is assigned to international collaborative research on critical periods of development to examine the effects of environmental factors on subsequent mental health and on high-risk Ss, by means of longitudinal neurophysiological studies. An example of a research project combining these 2 studies is included.—*Journal abstract*.

8263. Albee, George W. (Case Western Reserve U.) **The uncertain future of clinical psychology.** *American Psychologist*, 1970(Dec), Vol. 25(12), 1071-1080.—Examines the forces operating to inhibit the growth of clinical psychology, including the location of clinical training in the graduate school, the incompatibilities between a science and a profession, and the in-

appropriateness of the psychiatric setting and medical model. Consideration of the cost of viable alternatives includes 4 possible courses: (a) perpetuation of the Boulder model, (b) development of separate professional schools of psychology, (c) effecting a new liaison with another major profession, and (d) abandonment of clinical psychology as a separate field. Because of the difficulties in financing professional training, and the impending increased demand for teachers of psychology, it is concluded that clinical psychology, as it has developed, may decline in strength and importance for the next few years.—*Author abstract*.

8264. Belsasso, Guido. (National Inst. of Neurology, Outpatient Services, Mexico City, Mexico) **The history of psychiatry in Mexico.** *Hospital & Community Psychiatry*, 1969(Nov), Vol. 20(11), 342-344.—Mexican psychiatry dates back to the pre-Hispanic Aztec society when highly advanced forms of psychiatry and psychotherapy flourished. The Spaniards introduced medicine which was a combination of Renaissance rational and academic medicine with superstitious folklore concerning diabolic possession of the afflicted. The 1st hospital for the mentally ill, San Hipolito, was founded in Mexico City in 1567. Mexican mental hospitals were run by religious orders until independence from Spain. In 1947, the 1st attempt was made to coordinate care of the mentally ill. Efforts were begun to expand and improve facilities and training programs. Mexico's problem is that doctors continue to seek their training or residencies outside of the country; of the 100 who have trained in psychiatry in the United States, only 46 have returned to Mexico to practice. It is concluded that Mexico should continue to improve and expand its training and treatment program, to encourage specialists to remain in the country, and to further improve the care of the mentally ill.—*M. Walker*.

8265. Bolzinger, A., Ebtinger, R., & Kammerer, T. (14 rue du Général Ferrié, Grenoble, France) **Approches cliniques et psychopathologiques de la notion de crise.** [Clinical and psychopathological approaches to the concept of fits.] *Evolution Psychiatrique*, 1970(Apr), Vol. 35(2), 431-451.—Examines the concept of "fits," or "attacks," represented in the classical vocabulary of both physician and psychiatrist. It carries rich and varied meanings which reflect various aspects of cultural and social life. It relates in particular to presuppositions of medical ideology concerning the phenomena of regression and cathartic abreaction. These latent concepts are compared with clinical observations on acute neurosis and psychosis studied in the light of psychoanalysis. (27 ref.)—*English summary*.

8266. Bourdon, Roger D. (U. North Carolina) **Imitation: Implications for counseling and therapy.** *Review of Educational Research*, 1970(Jun), Vol. 40(3), 429-457.—The potential that imitation learning holds for practical application in therapy and counseling appears to be significant. Research efforts to date on this phenomenon have been relatively few. These are discussed under the headings of social learning and imitation, vicarious learning, variations in imitation research, operant analysis of imitation, and imitation, counseling, and therapy. (4 p. ref.)—*P. D. Leedy*.

8267. Brill, F. (U. Tel Aviv Medical School, Mental Health Clinic, Israel) **The trauma: Theoretical considerations.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Apr), Vol. 7(1), 96-108.—Discusses trauma as a "test of psychiatric thought" on 3 levels:

(a) the relationship between understanding and explanation, and the need to distinguish between the two; (b) acute trauma and the problem of the posttraumatic neurosis; and (c) the trauma of existential crisis. A review of the definition and theories indicate a shallow specific theoretical orientation which fails to account for the various aspects of a traumatic experience. The need to understand "mental trauma in the context of a comprehensive psychopathological conception free from the bonds of physical-biological thinking" is emphasized. (24 ref.)—G. Steele.

8268. Buscaino, G. A., Spadetta, V., & Carella, A. (U. Bari, Clinic for Nervous & Mental Illness, Italy) **Il test di metilazione nella schizofrenia: Considerazioni su una casistica di 500 sperimentazioni.** [The methylation test in schizophrenia: Considerations based on experimentation with 500 subjects.] *Acta Neurologica*, 1969(Mar), Vol. 24(2), 113-118.—Describes a study of in-vitro methylating activity of the blood of 500 active schizophrenics, chronic or treated schizophrenics, patients with different psychiatric and neurological disorders, and controls. Results show a much higher methyl-transferase activity in active schizophrenics compared with other groups. A study of cerebrospinal fluid findings shows that $\frac{1}{2}$ the samples had definite methyl-transferase activity, but there is not a significant difference between active schizophrenics and other neurological or psychiatric patients. (19 ref.)—*English summary.*

8269. Charny, Israel W. (Guidance Consultants, Paoli, Pa.) **Individual and Family Developmental Review: Manual.** Los Angeles, Calif.: Western Psychological Services, 1969. 8 p.

8270. Chassin, J. B. (Hoffman-La Roche, Research Div., Nutley, N.J.) **Population and sample: A major problem in psychiatric research.** *American Journal of Orthopsychiatry*, 1970(Apr), Vol. 40(3), 456-462.—Discusses difficulties encountered in the application of statistics to research in psychiatry. Perhaps the most difficult problem is that of generalizing from sample to population. Fundamental issues are considered concerning this from a clinical and statistical viewpoint. It is advocated that, when feasible, statistics be applied to the detailed study of individual cases, as in the testing of hypotheses within Ss, rather than between groups of Ss.—*Journal abstract.*

8271. Coddington, R. Dean & Bruch, Hilde. (Ohio State U., Medical School) **Gastric perceptivity in normal, obese and schizophrenic subjects.** *Psychosomatics*, 1970(Nov), Vol. 11(6), 571-579.—Describes a method testing the ability of humans to recognize an intragastric stimulus, i.e., fluid food introduced into the stomach with exclusion of other clues. The reliability and shortcomings of the method were evaluated in an experiment with 15 obese, 3 anorexic, 17 schizophrenic, and 18 mental defective Ss and 21 controls. Results indicate marked individual differences. Many controls were accurate in recognizing the stimulus, whereas Ss of abnormal body weight were significantly less accurate. It is noted that intelligence did not influence results. The hypothesis, that people who misuse the eating function in face of life stress are deficient in their ability to identify their bodily states, is confirmed.—*Journal summary.*

8272. Cohen, Wilbur J. **Revolution in mental health. Personnel Administration**, 1969(Mar), Vol. 32(2), 4-8.—Postulates that the decline in the number of patients in state mental hospitals is a result of innovations in

mental health programs. The use of psychoactive drugs, the development of community facilities for psychiatric care, and a change in community attitudes are emphasized. Industrial and managerial roles in the maintenance of emotionally disturbed persons in the community are examined.—G. Steele.

8273. D'Arcy, Elizabeth. (Alder Hey Children's Hosp., Liverpool, England) **Congenital defects: Mothers' reactions to first information.** *British Medical Journal*, 1968(Sep), Vol. 3(5621), 796-798.—Administered questionnaires to 694 mothers of infants with congenital defects to determine how, when, and from whom they were notified of the defect and their attitudes concerning it. Data were analyzed according to the type of defect. Results show that mothers attached great importance to a sympathetic and understanding approach, simple terminology, and truthful answers to questions.—G. Steele.

8274. Friedman, Joseph J. (Broome Co. Mental Health Services, Binghamton, N.Y.) **Conscience and its relation to sex.** *New York State Journal of Medicine*, 1970(Sep), Vol. 70(18), 2323-2327.—Presents 6 clinical cases to illustrate how problems of sex and conscience are interrelated. The development of the conscience is briefly traced, and the dynamics, treatment, and end results are briefly discussed. It is suggested that most problems of conscience and sex can be treated by an appreciative reward system.—*Journal summary.*

8275. Hersch, Paul D. (U. Connecticut) **The accuracy of clinical predictions as a function of feedback and hypothesis explication.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1538.

8276. Herzog, Elizabeth & Lewis, Hyman. (Children's Bureau, Div. of Research, Washington, D.C.) **Children in poor families: Myths and realities.** *American Journal of Orthopsychiatry*, 1970(Apr), Vol. 40(3), 375-387.—Presents popular fallacies concerning children and families that can obstruct effective services and interventions. Safeguards suggested against mistaking fallacy for fact include (a) skepticism about the single-barreled explanation or cure for serious problems, and (b) refusal to classify a child as beyond help because of a single unfortunate characteristic or circumstance. (32 ref.)—*Journal abstract.*

8277. Krakowski, Adam J. (Champlain Valley-Physicians Hosp., Medical Center, Plattsburgh, N.Y.) **Psychosomatic or comprehensive? The role of the physician in the total management of the patient.** *Psychosomatics*, 1970(Nov), Vol. 11(6), 587-590.—Discusses the view that psychosomatic approaches and the comprehensive management of patients are similar in that they both deal with "psychogenic problems which are primary, concurrent with, or secondary to organic illness." The psychiatrist must, therefore, use an approach which emphasizes the concept that the patient is a mind-body entity. Illness is seen as a 2-way process having both psychosomatic and somatopsychic components. Effective use of this approach requires that the physician have a positive doctor-patient relationship and possess professional flexibility.—P. McMillan.

8278. Livingstone, John B., et al. (Beth Israel Hosp., Boston, Mass.) **A new multidisciplinary child clinic: Description of a research study and a report of clinical results.** *Journal of the American Academy of Child Psychiatry*, 1970(Oct), Vol. 9(4), 688-706.—Describes a multidisciplinary child clinic, the Team Clinic for Children, which is distinguished from traditional

child-guidance clinics in its (a) use of the same traditionally trained child psychiatrist, psychiatric social worker, child psychologist, and pediatrician constantly working as a team; (b) aim of arriving at a comprehensive evaluation and disposition in a single, 3-hr encounter with the child and parents; (c) structuring of team conferences during the session; and (d) active participation, in the session itself, of appropriate people from the community already involved with the child. A developing research study is described. Findings on the 1st 58 patients, primarily a mixed somatic and psychological symptom group, show a high rate of disposition completion (76%). The clinical method is described in detail using clinical examples from previous research. An appendix with codes of major observable problem areas and dispositional recommendations is included.—*M. Maney.*

8279. Marx, Otto M. (Boston U., Medical School) **What is the history of psychiatry?** *American Journal of Orthopsychiatry*, 1970(Jul), Vol. 40(4), 593-605.—Contends that psychiatry is a medical specialty that has changed and will continue to do so under the influence of extramedical developments. But nonpsychiatrists writing psychiatric history will have to become acquainted with the practical problems with which psychiatry has had to contend. 4 modes of approach which are discussed in detail may be respectively labeled the evolutionist-enlightened, the progressive-psychoanalytic, the social-cultural, and the psychologic-ideational. Advantages and disadvantages of each approach are elucidated. (40 ref.)—*Journal abstract.*

8280. Maupomé, J. J. (Psychiatric Hosp. of Rabat-Sale, Morocco) **Sur quelques aspects de la psychiatrie marocaine.** [On some aspects of Moroccan psychiatry.] *Annales Médico-Psychologiques*, 1970(Jun), Vol. 2(1), 33-56.—Reviews the psychiatric problems and treatment resources of contemporary Morocco with a special emphasis on psychosocial determining factors. Hospital use and distribution are chiefly urban, although most of the population is rural and agricultural. The Moslem religion and North African sex roles and family structure are seen as primary forces in both the definition of illness and the expectations for care. Special problems are posed also by language, as few mental health professionals are native; a legacy of the nation's long colonial history. The widespread use of drugs (cannabis) and magical healing folk customs further complicate the appraisal of psychiatric issues. The physician is often seen not as one who cures, but as one who certifies the presence of illness. This assures a shift in the patients' social role and status, matters of great importance in the Moroccan culture.—*H. E. King.*

8281. McDermott, John F. (U. Hawaii, Medical School) **Divorce and its psychiatric sequelae in children.** *Archives of General Psychiatry*, 1970(Nov), Vol. 23(5), 421-427.—Reports a study designed to (a) examine statistically the characteristics of children from divorced families seen at a university children's psychiatric hospital, (b) relate these characteristics to the divorce experience, (c) follow immediate reactions into later changes in character development, and (d) relate family disruption to an aspect of psychosocial disturbance in delinquent children. Data from intake records of 1487 children up to age 14 indicate that 116 were from divorced parents, 1349 from legally intact parents, and 22 from parents who were separated but not divorced. Results suggest that reactions to the divorce

experience persisted in Ss for some time. The largest subgroup showed a subclinical depressive period after the divorce. A high correlation was noted between S's symptoms and his image of the absent parent, suggesting identification with the parent as a method of dealing with the loss. The need for improved facilities for dealing with mental health components surrounding divorce is stressed, emphasizing the vulnerability of children at that time. It is concluded that a framework for protection of the rights and needs of children must be developed. (17 ref.)—*P. McMillan.*

8282. McNeil, Thomas F., Wiegerink, Ronald, & Dozier, J. Emmett. (Lafayette Clinic, 951 E. Lafayette, Detroit, Mich.) **Pregnancy and birth complications in the births of seriously, moderately, and mildly behaviorally disturbed children.** *Journal of Nervous & Mental Disease*, 1970(Jul), Vol. 151(1), 24-34.—Studied the histories of pregnancy and birth complications (PBCs) in the births of 61 children under treatment for a range of psychologically-related behavioral disturbances and 305 matched controls born in consecutive birth series in the same hospitals with disturbed Ss. Birth records were evaluated by an E who was unaware of the disturbed or control status of the S involved. Data were collected on the Birth Information Form which yielded consistent intercoder agreements of 95%. As compared with controls, there was a significantly greater number of disturbed Ss with a history of PBCs and of PBCs/Ss. Seriously disturbed Ss had slightly higher frequencies of PBCs than moderately to mildly disturbed Ss. Prematurity, problems concerning birth, and a persisting weak or delayed respiration were especially notable in the histories of the disturbed Ss. (37 ref.)—*Journal abstract.*

8283. Michal-Smith, Harold. **Rehabilitation of the mentally retarded blind: The past, present, and future.** *Rehabilitation Literature*, 1969(Jul), Vol. 30(7), 194-198.—Reviews historical attitudes toward the mentally retarded blind and discusses rehabilitation as including "the global aspects of total functioning." The questions of assessment, concept learning, self-differentiation, and motility are examined. The reactions of parents and sighted people to the mannerisms and the reactions of the retarded blind to the environment are discussed. Prevention of multiple handicaps is viewed as a present goal of medicine. It is concluded that attitudinal changes toward the multiple handicapped are necessary before they can be helped to reach their full potential.—*G. Steele.*

8284. Morozova, N. G. **Formirovanie poznavatel'nykh interesov u anomal'nykh detei.** [Formation of cognitive interests in nonnormal children.] Moscow, USSR: Prosveshchenie, 1969. 280 p.—Presents the findings of observational and experimental studies on the development and formation of cognitive interests in deaf, blind, visually handicapped, and mentally retarded children, and children with underdeveloped speech.—*I. D. London.*

8285. Musto, David F. (Yale U., Medical School) **History and psychiatry's present state of transition.** *Archives of General Psychiatry*, 1970(Nov), Vol. 23(5), 385-392.—Examines psychiatry's present role confusion in light of similar periods of uncertainty in United States medicine during the 19th century. Because of the advances and growing influence of both community psychiatry and psychopharmacology, there is now "no 1 dominant view of the psychiatrist's role." The role of

Benjamin Rush in 18th century medicine and the influence of thomsonianism, eclecticism, the Paris school of research in medicine featuring new instruments and statistical methods, and the theory of homeopathy founded by Samuel Hahneman are discussed. The eventual development of an organic model of illness and function in the late 19th century is noted. It is suggested that historical perspective can be useful to contemporary psychiatry by offering a challenge "to keep free productive energy in the face of uncertainty, and to resist the lure of professional harmony achieved by theoretical or practical exclusiveness."—P. McMillan.

8286. **Schrager, Jules & Lindy, Janet.** (U. Michigan Hosp.) **Hyperkinetic children: Early indicators of potential school failure.** *Community Mental Health Journal*, 1970(Dec), Vol. 6(6), 447-454.—Identifies hyperkinetic children as a "population-at-risk" upon admission to kindergarten. A study is reported of 51 kindergartners identified as hyperkinetic, using behavioral criteria developed in an earlier test (e.g., being fidgety and restless, inattentive, hard to manage, and unable to sit still, pay attention, or take frustration), as measures. Results demonstrate that Ss were (a) absent from school more frequently, and (b) did remarkably less well on standardized tests of school readiness than their peers (N=56) rated nonhyperkinetic. Implications are discussed and suggestions made for the development of intervention programs.—*Journal abstract*.

8287. **Schwab, John J.** (U. Florida) **Comprehensive medicine and the concurrence of physical and mental illness.** *Psychosomatics*, 1970(Nov), Vol. 11(6), 591-595.—Discusses mental and physical components of illness in patients based on experiences in a psychiatric consultation service and an epidemiologic study of a southeastern county. It is noted that when a patient has a concurrent illness, either the mental or physical portion may be neglected. Endocrine disorders, epilepsy, and brain tumors are cited as examples of illnesses which are frequently obscured by behavioral symptomatology. The close interplay between depressive symptomatology and gastrointestinal disturbances is noted, and depression is often "the earliest complaint expressed by patients later found to have carcinoma of the pancreas." It is concluded that (a) sociodemographic groupings are necessary for generalizing about symptomatology, and (b) a need exists for psychiatrists and other physicians to form effective working alliances in this area. (18 ref.)—P. McMillan.

8288. **Stevenson, Ian.** (U. Virginia, Medical School) **Assumptions of religion and psychiatry.** *Pastoral Psychology*, 1969(Jun), Vol. 20(195), 41-50.—In comparing religion and psychiatry, it is concluded that the disciplines can be supplementary. The religious conviction that man can come to know himself as well as he can know other men is seen in relation to the psychoanalytic stress on self-analysis. (20 ref.)—O. Strunk.

8289. **Sutherland, Sandra & Scherl, Donald J.** (Metropolitan Mental Health Skills Center, Washington, D.C.) **Patterns of response among victims of rape.** *American Journal of Orthopsychiatry*, 1970(Apr), Vol. 40(3), 503-511.—13 18-24 yr. old victims of rape were seen, in most instances within 48 hr., by a mental health team. Followup of each revealed a similar sequence of reactions, falling in 3 distinct phases: (a) acute, including shock, disbelief, and dismay; (b) outward adjustment, containing a heavy measure of denial or suppression; and (c) integration and resolution. Understanding of this

pattern permits the design of supportive mental health intervention. (15 ref.)—*Journal abstract*.

8290. **Szasz, Thomas S.** (State U. New York, Upstate Medical Center, Syracuse) **Ideology and insanity: Essays on the psychiatric dehumanization of man.** Garden City, N.Y.: Doubleday, 1970. v, 265 p. \$1.95(paper).

8291. **Van Krevelen, D. A.** (Curium Pedological Clinic, Oegstgeest, Netherlands) **Über den Begriff der Psychopathie in der Kinderpsychiatrie.** [The concept of psychopathy in child psychiatry.] *Acta Paedopsychiatrica*, 1970(Feb), Vol. 37(2-3), 67-84.—The concept of psychopathy has a place in child psychiatry. It should be founded on psychopathology to prevent any association with standards of value. It is desirable to draw up a systematic typology, originating from disturbances of growth, regulation, and qualitative expression. Judging psychopaths should take 2 principles into consideration: even if they belong to the group of minus-variants, they always give proof of their positive qualities. Psychopathic children and adolescents should not be considered static individuals, influences of growth and dynamic moments being recognizable.—G. Rubin-Rabson.

8292. **Westman, Jack C., Cline, David W., Swift, William J., & Kramer, Douglas A.** (U. Wisconsin) **Role of child psychiatry in divorce.** *Archives of General Psychiatry*, 1970(Nov), Vol. 23(5), 416-420.—Reports impressions of divorce gained from the perspective of child psychiatrists in a family court and a child psychiatry clinic. Divorce is seen as a family matter with impact beyond the divorced couples themselves, and affecting any children involved. Out of 148 consecutive divorce cases in a family court, 71% involved children. It is concluded that (a) professional aid in planning should extend beyond the divorce decree, (b) the divorcing parties should be helped to face openly the reasons for the divorce, (c) children's interests should be considered in custody and visitation arrangements, and (d) children should be helped with their own feelings concerning reasons for the divorce.—P. McMillan.

8293. **Wright, K. J.** (Middlesex Hosp., London, England) **Exploring the uniqueness of common complaints.** *British Journal of Medical Psychology*, 1970(Sep), Vol. 43(3), 221-232.—Regards "meaning" as a relational term which necessarily implies the existence of a personal frame of reference. 2 contrasting approaches to a person's statements about himself are then discussed. They are distinguished by their attitude to personal meanings. The 1st (extrospective) attributes meaning to isolated fragments of personal data from an external theoretical perspective; the 2nd (introspective) attempts to explore and make explicit the natural context of personal data, locating them within the person's own frame of reference. The relationship of such strategies to current conceptions of scientific method is briefly discussed. Theoretical considerations are illustrated by reference to symptoms and the kinds of meaning they might be deemed to have from the different approaches. Hinkle's "laddering" technique is described as a method which provides a way of exploring systematically aspects of a person's system of meanings. This is illustrated with examples taken from the investigation of an agoraphobic patient. The way in which the data yielded by the method can be used as a source of inferences about the person is also illustrated. Finally, the ambiguity in speaking of a person's frame of reference or system of meanings is underlined, and some possible uses and

limitations of the kind of method described are discussed.—*Journal summary.*

PERSONNEL

8294. Baruk, H. *La vie et l'oeuvre de Moreau de Tours.* [The life and work of Moreau de Tours.] *Annales Médico-Psychologiques*, 1970(Jun), Vol. 2(1), 27-32.—Presents a biographic sketch of Moreau de Tours, a pioneer in French psychiatry. His interests tended toward the physiological and biological, thereby lending balance to the early predominance given to moral causation of the behavior disorders by Pinel and Esquirol. His book on hashish, published in 1845, was a foundation stone for modern psychopharmacology. He is also known for his early interest in the problems of epilepsy and for the fruitful analogy he made between psychosis and the normal dream process. The Society of Moreau de Tours was formed in 1959 to honor his name and to further the study of psychopharmacology. The interests of the society have extended to psychiatric pharmacology in antiquity, histopathologic and biochemical investigation of mental disease, and experimental psychopathology in animal Ss.—*H. E. King.*

8295. Blake, Yvonne. *Clinical psychology as a career.* *Psychological Scene*, 1968(Sep), Vol. 2, 65-67.

8296. Boyarsky, Rose E. & Vance, Terry G. (Duke U.) *The use of role-play in psychotherapy training.* *Group Psychotherapy & Psychodrama*, 1970, Vol. 23(1-2), 35-40.—Beginning therapists were placed in a dyadic relationship which included mutual observation and criticism of techniques and role-playing sessions. Generally such a program was found to be of value in diminishing anxiety and developing techniques.—*A. Krichev.*

8297. Brodsky, Carroll M. (U. California, Medical School, San Francisco) *Decision-making and role shifts as they affect the consultation interface.* *Archives of General Psychiatry*, 1970(Dec), Vol. 23(6), 559-565.—Reports on a 30-mo program of supplemental consultation services by psychiatric residents to 3 university hospital outpatients clinics: physical medicine and rehabilitation, neurology, and dermatology. Evaluation of the program was based on an integration scale (technical and social) and an acculturation scale. Results indicate that factors determining the acceptance and utilization of the psychiatric consultant are "not person-oriented but are determined by the types of decision that have to be made in a given clinic, by the system for making these decisions, and the effect that changes in the decision-making system will have on the clinic physician's role and consequently on his relationship with his patient." (19 ref.)—*P. McMillan.*

8298. Cattell, James P. (Jewish Memorial Hosp., New York, N.Y.) *Psychiatric emergencies in general practice: Reassessment.* *New York State Journal of Medicine*, 1970(Sep), Vol. 70(17), 2219-2223.—Defines a psychiatric emergency as any situation that jeopardizes the mental health and emotional equilibrium of the patient and that may be alleviated by immediate action. The precursors of acute psychiatric emergencies are often detectable if the physician is aware of the possibilities of an emergency developing. The physician's concept of himself as a person and as a professional man may or may not be advantageous, depending on the extent to which he allows value judgments to influence his thinking. The relatives of patients may be more

problematic or may have more pathologic conditions than the patients have. Awareness of this possibility and the need to deal with it are crucial. It is concluded that immediate action is the beginning of treatment.—*Journal summary.*

8299. Hall, John. (St. Andrew's Hosp., Thorpe, England) *Psychological manpower in the health service: Use or misuse.* *Bulletin of the British Psychological Society*, 1970(Jul), Vol. 23(80), 219-222.—Discusses the role of psychologists in the British Health Service. Critical problems in the use of psychological manpower are cited. It is argued that positive guidance must be given by the British Psychological Society immediately if the advancement of clinical psychology is to be promoted, and if the high standards of the Society are to be maintained.—*V. S. Sexton.*

8300. Hetherington, Ralph. (U. Liverpool, England) *Ethical problems in clinical psychology.* *Bulletin of the British Psychological Society*, 1970(Jul), Vol. 23(80), 204-206.—In the light of the psychologist's task to help the patient achieve what he wants to achieve in his own way, the ethical problems of kindness and consideration, privacy, and confidentiality are discussed. Most of these ethical problems resolve themselves when the basic principle of self-determination of the patient and of his final and full cooperation are recognized.—*V. S. Sexton.*

8301. Schuster, Daniel B. & Freeman, Edwin N. (U. Rochester, Medical School, Adult Psychiatric Outpatient Div.) *Supervision of the resident's initial interview.* *Archives of General Psychiatry*, 1970(Dec), Vol. 23(6), 516-523.—Describes a procedure used to train 2nd-yr psychiatric residents in their initial interviews with patients in an adult outpatient clinic of a metropolitan medical center. The procedure involves the presence of the supervisor as an inconspicuous 3rd party in the interview situation. Instances of necessary intervention by the supervisor are described. Common problem areas encountered by the resident include (a) detection of latent psychotic trends, (b) handling of sensitive emotional issues, (c) being alert to medical complications, and (d) dealing with panicky and otherwise difficult patients. Illustrative case examples are included. (15 ref.)—*P. McMillan.*

8302. Sherman, Roger W. & Hildreth, Arthur M. (Johns Hopkins Hosp., Henry Phipps Psychiatric Clinic, Baltimore, Md.) *A resident group process training seminar.* *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 372-375.—Describes a useful teaching tool in a psychiatric residency, an ongoing group process seminar. In it residents learn to recognize and deal with the forces of competition, scapegoating, dependency, and helpless rage at the administration. Studying these forces makes it possible to understand and effectively counter similar processes in other groups, e.g., inpatient wards.—*Journal abstract.*

8303. Yenawine, Gardner & Arbuckle, Dugald S. (U. Massachusetts, Boston) *Study of the use of videotape and audiotape as techniques in counselor education.* *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 1-6.—Compares and contrasts the effects of using audiotape and videotape recording techniques on counselor trainee experiences within the counseling practicum. 14 undergraduates, in 2 groups, 1 using videotape, the other audiotape, were observed for 1 semester. Data were gathered primarily by the use of a counselor log. Differences in the use of the 2 approaches are noted. It is concluded that due to the relative

completeness of the recordings, videotape provides a more objective basis for the evaluation of counselor interviews than audiotape.—*Journal abstract.*

PSYCHOTHERAPY & ANALYSIS

8304. **Arata Andrea & Bevilacqua Arata, Piera.** *La psicoterapia nel trattamento dei caratteropatologici a condotta antisociale.* [Psychotherapy in the treatment of character disorders of antisocial behavior.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 371-377.—Psychotherapy in character disorders with antisocial behavior presents many difficulties, and failures are numerous. The attitude of society on such individuals has been to repress them and confine them in institutions under rigid discipline. It is necessary to 1st thoroughly investigate the structures and dynamics of the antisocial personality. The Ss are generally of average intelligence, characterized during formative years by irregular behavior, excessive restlessness, aggression, and consequently escape from the home, domestic theft, and precocious sexual activity, sometimes homosexual. The role of the psychiatrist in reform work is to help the S to resolve his interpersonal problems, and make the S well disposed toward other educators. 1st the psychiatrist must establish a valid interpersonal relationship with the S. The patient must choose, by his own will, to be helped, not simply to adjust to the rules of an institution. Group dynamics appear to be the best way to progress with character disorders of a delinquent type. (18 ref.)—A. M. Farfaglia.

8305. **Balestri, Luisa; Renzi-Guastalla, Bianca, & Tremelloni, Laura.** *Psicoterapia combinata in due casi di anomalia della condotta.* [Combined therapy in two cases of abnormal conduct.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 343-355.—Defines character disturbance as an entire clinical picture, characterized by abnormal conduct which shows up on an EEG. A 9- and a 14-yr-old S with serious behavior problems were studied. The younger S demonstrated aggressiveness, particularly toward his parents, e.g., he attempted to kill them. In sessions of psychotherapy, attended also by the mother, the therapist aimed at representing the "good authority." Regarding the psychotherapy of the mother, she succeeded in considering her child "ill" and not "naughty" and became less anxious and less authoritarian. The older S was melancholic and depressed and constantly exposed to family arguments. In both cases the psychotherapy of both S and parents was essential. A change in parent-child relations could take place on a mature basis. (31 ref.)—A. M. Farfaglia.

8306. **Banerji, Saradindu.** *Observations on psychoanalysis and existentialism.* *Samiksa*, 1968, Vol. 22(2), 50-72.—Presents a comparative study of psychoanalysis and existentialism, especially concerning human personality, and critically examines existentialist views from the analytical standpoint. An outline of Daseinanalyse and a pertinent case history are presented. A brief reply to the existentialist analyst's objections to Freudian analysis, and a psychoanalytical estimate of existential analysis are offered. A psychoanalytical explanation of the form assumed by existentialism in general is presented. (21 ref.)—T. N. Webster.

8307. **Benders, H.** (U. Nijmegen, Psychiatric Clinic, Netherlands) *Psychiatry and objectivity: Methods in the therapeutic use of movement, music and creativity.* *Psychiatria, Neurologia, Neurochirurgia*, 1969(Jul),

Vol. 72(4), 337-351.—Argues that a large number of specialists attending a sickbed obscures the personal responsibility concerning improvement or aggravation of the psychiatric patient's condition. A narcissistically colored scientific focus on profundity in the disciplines is cautioned against. It is suggested that the various disciplines should aim at (a) control and being-controlled, (b) an optimally systematic approach, (c) transferability of their activities, (d) analysis of what is being done, and (e) evaluation of what is achieved. It is demonstrated that movement, music and creative therapy must not be confused with occupational therapy, and an attempt is made to establish the extent to which these 3 types of therapy meet the demand for a scientific approach. In movement therapy, the method used in collecting data and their statistical analysis are inadequate and spurious. Music therapy is described as being on the right road; rhythm can be a safe starting-point of controlled investigation. In its impatience for objective standards of determination, creative therapy should not follow movement therapy on the tempting road of spurious research, but should remove the uncertainties about its own pretensions and start well-focused and perspicuous projects. The pictorial products of 3 patients are presented to illustrate some of the possibilities of creative therapy.—*Journal summary.*

8308. **Berlin, Irving N.** (U. Washington, Medical School, Div. of Psychiatry) *Crisis intervention and short-term therapy: An approach in a child-psychiatric clinic.* *Journal of the American Academy of Child Psychiatry*, 1970(Oct), Vol. 9(4), 595-606.—Describes efforts in understanding and teaching crisis intervention and brief therapy with families. 3 case examples are presented to illustrate learning experiences which led to the development of this model. The requirement of training in dynamic psychiatry is emphasized as a basis for understanding and applying lessons from ego psychology developed by Anna Freud, Erikson, Lindemann, and Caplan. (18 ref.)—*Journal summary.*

8309. **Bhattacharyya, Somnath.** *A case of conversion.* *Samiksa*, 1969, Vol. 23(1), 9-21.—Presents the case of a 21-yr-old woman who, while feeling sexual attraction toward her father, was repelled by sex, due to her strong superego (the internalized puritanical father) to which her incestuous leanings were unacceptable. Psychosomatic vaginal sphincter pain also rendered her vagina impenetrable to the phallus of her father. Projecting the blame onto the men in her sexual adventures, she debased all father figures, never really understanding her father hatred and projection defense before termination of treatment.—T. N. Webster.

8310. **Bonarius, J. C.** (U. Groningen, Netherlands) *Fixed role therapy: A double paradox.* *British Journal of Medical Psychology*, 1970(Sep), Vol. 43(3), 213-219.—Sketches with the help of an illustrative case the 3 phases of G. A. Kelly's "fixed role" therapy: 1st, a diagnostic analysis of the patient's construct system; 2nd, the creation of a role character completely different from the patient's personality, but fitting his life situation; and 3rd, the guidance of the patient by rehearsing role enactments during therapy sessions. The similarities and the differences with behavior therapy, Rogerian therapy, and psychoanalysis are discussed.—*Journal summary.*

8311. **Brigham, Fleda M.** (Kirkville Coll. of Osteopathy & Surgery, Mo.) *Masks as a psychotherapeutic modality: A hypothesis.* *Journal of the Amer-*

ican Osteopathic Association, 1970(Feb.), Vol. 69(6), 549-555.—A historical review of the literature demonstrates that since the earliest times, men have used masks to meet basic religious, psychological, and physiological needs. Examples of mask symbolism from Neolithic Europeans, Greeks, Romans, Africans, Eskimos, Indians, and Japanese are presented to substantiate the hypothesis that masks can be used as a psychotherapeutic modality. "Mask therapy is seen as an extension of natural behavior into the therapeutic environment as is psychodrama, play therapy, and other activities converted into forms of treatment." It is suggested that masks might be used as both a psychodiagnostic and preventive measure in mental illness. It is also suggested that criteria for mask therapy would be similar to criteria for all other forms of psychotherapy. More specific methods for the application of mask therapy in different age groups and disease entities are discussed. (52 ref.)—P. R. Shibelski.

8312. Carrera, Frank & Adams, Paul L. (U. Florida, Medical School) **An ethical perspective on operant conditioning.** *Journal of the American Academy of Child Psychiatry*, 1970(Oct), Vol. 9(4), 607-623.—Specifies certain values that govern child psychotherapy, and examines operant conditioning with respect to its place in child psychiatric practice, education, and research. The progression of the child's insightful learning during psychodynamically guided psychotherapy is contrasted with that during operant conditioning, and the therapist's personal advancement in self-insight during use of both approaches is discussed. The medical ethics of human experimentation and the legal concept of "best interests of the child" are proposed as codified schemata for ethically appraising the psychotherapeutic and operant methods. Within this framework, the psychotherapeutic and operant approaches are compared as to the place of symptoms, the therapist's personality and role, and the child's engagement in the process. Operant techniques showed 2 major pitfalls: (a) endorsement and subserving of parental valuations even when parental values may be illusory or in outright conflict with the child's best interests; and (b) transmission of a limited, mechanistic view of human interaction to child and family. Using case materials, it is demonstrated that the child psychotherapist's nondoctrinaire approach encourages a flexible and pragmatic readiness to serve the entire range of the child's interests. Thus he may at times utilize operant techniques in combination with techniques derived from other therapeutic traditions. (18 ref.)—*Journal summary*.

8313. Chartier, George M. (Arizona State U.) **A-B therapist variable: Real or imagined?** *Psychological Bulletin*, 1971(Jan), Vol. 75(1), 22-33.—Traces the development of research on A-B therapist "type" as an important variable in psychotherapeutic outcome. 2 sets of clinical studies which suggest that therapist type and patient characteristics interact in producing differential outcome are critically reviewed. Subsequent research, largely of an analog variety, is then evaluated with particular respect to the adequacy with which natural psychotherapy conditions have been approximated. It is argued that the extensive laboratory research has not increased understanding of the original phenomena and that the analog studies constitute a case of premature simplification, since the original clinical research provided an insufficient basis for the interaction hypothesis. (42 ref.)—*Journal abstract*.

8314. Chethik, Morton. (U. Michigan, Medical School) **The impact of object loss on a six-year-old.** *Journal of the American Academy of Child Psychiatry*, 1970(Oct), Vol. 9(4), 624-643.—Presents the case history of a 5-yr-old boy, tracing the events of the 10 mo. of analytic treatment preceding the death of his mother. The threat of disintegration of the self as an impediment to accepting death is stressed. The problems involved in mourning that this child presented and their implications for death and for young children in general are discussed.—M. Maney.

8315. Cima, Ettore; Montabbio, Enrico, & Venuti, Giorgio. **Esperienze psicoterapiche in soggetti con anomalie comportamentali to pio "caratteriale" e con lieve ritardo intellettivo.** [Psychotherapeutic experiments in Ss with abnormal behavior of "character disorder" nature and with slight intellectual retardation.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 388-399.—Based on the presuppositions that (a) a child has impulses and needs, e.g., to be socialized; (b) a child is situated in the "real" world, e.g., he must evaluate the "object" and adapt himself to it; and (c) a child is a person in a group, e.g., he must accept others and be accepted, an experiment was conducted with 8-12 yr. old institutionalized boys with an IQ of 75-85. Ss were divided into 3 groups according to the type of abnormal behavior—neurotic, prepsychotic, and psychopathic. Individual dialogues were held each wk. from 20-50 min. This type of psychotherapeutic treatment resulted in 3 phases: recognition, deconditioning, and conditioning. In the last phase, the neurotic S realizes he can love and be loved and accepts interpersonal relations and the integration in a group; the prepsychotic S accepts relationships outside himself and adapts himself if only to satisfy his own needs; and, the psychopathic S does not accept social integration. (18 ref.)—A. M. Farfaglia.

8316. DuPont, Robert L. (Dept. of Corrections, Washington, D.C.) **The impostor and his mother.** *Journal of Nervous & Mental Disease*, 1970(Jun), Vol. 150(6), 444-448.—Reports a case history and a 2-yr course of psychoanalytical psychotherapy of an impostor treated in a prison. The psychodynamic findings emphasize the impostor's intense, ambivalent relationship with his mother from whom he was never psychologically separated.—*Journal abstract*.

8317. Feinberg, Daniel. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Preventive therapy with siblings of a dying child.** *Journal of the American Academy of Child Psychiatry*, 1970(Oct), Vol. 9(4), 644-668.—Presents brief therapy of 2 sisters of a dying child. The therapeutic technique dealt with the threatened loss by a forthright approach and attention to details of the reality situation. Immunizing discussions and allowance for catharsis without regression were encouraged, and transference material was interpreted where it related to object loss and might have induced sad effects. An empirical assessment of the therapy suggests that there was considerable immediate ventilative help at a time of great stress, with prevention of secondary behavioral complications or an outbreak of neurotic symptomatology. A brief 10-mo follow-up suggests that such supportive therapy, although it may help in the immediate manifestation of feelings, has little enduring effect on a child's capacity to sustain a prolonged mourning process. Implications of the material are discussed regarding: (a) the influence of sudden or protracted dying on grief and mourning, (b) how grief

differs in the event of parental bereavement as opposed to sibling bereavement, and (c) what constitutes normal as opposed to abnormal childhood grief or mourning.—*Journal summary.*

8318. Fiorini, Héctor J. (G. Aráoz Alfaro Polyclinic, Provincia de Lanus, Argentina) **Delimitación técnica de psicoterapias.** [Technical framing of psychotherapy.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Jun), Vol. 16(2), 117-124.—Discusses the problem of utilizing in mental care institutions psychotherapeutic techniques which do not stem from clearly defined strategical models and which, on the contrary, combine technical resources belonging originally to different strategies (support, clarification, and transference techniques). Several parameters are mentioned which could establish a profile on any given psychotherapy as well as to fundament its specific procedures.—*English summary.*

8319. Friedenthal, Hebe & Madanes, Nidia. **Errores en el análisis de niños.** [Mistakes in child analysis.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969, Vol. 15(3), 257-260.—Points out common mistakes in child psychoanalysis made by beginners: (a) underestimation of difficulties in treating children as compared to adults, (b) exaggeration of elements pertaining to the consulting room, (c) preconceptions about the symbolic meaning of toys given to the child, (d) use of interpretations which are made out of theoretical assumptions rather than out of the observation of the child, and (e) mistaken use of comments made by the supervisor. These problems are due to the lack of institutions where systematic knowledge could be acquired. Stresses the need for more investigation in psychotherapy, especially research on the type of content analysis of therapeutic interviews that would lead to identify interpretations that are harmless (and useless), mistaken, harmful, and correct.—*English summary.*

8320. Georgin, B. L. & Wagret, G. (1 bis, Cours du Parc, Dijon, France) **Notes sur la dialectique "fantasme-réel" et incidences en psychothérapie.** [Notes on the "fantasy-reality" dialectic and its effects in psychotherapy.] *Evolution Psychiatrique*, 1970(Apr), Vol. 35(2), 465-478.—Examines the dialectic relationships between reality and the fantasy life. These relationships are seen, above all, as antagonistic, but also as complementary; their necessity is evident in analyses of organizations in which there is a massive prevalence of 1 or the other. In "real" situations, as well as in the transference analytical situation, the bipolarity of reality and fantasy polarize a great number of psychodynamic phenomena according to a dialectic whole of varied significance. This dialectic, beyond the antagonistic confrontation of pressure from reality and fantasy, and also beyond their necessary association, can resolve itself either within the framework of the spontaneous development of the personality, or within the psychotherapeutic setting by the elaboration of impulses and maturation of the ego. These latter mechanisms make possible the emergence of creative spontaneity which enables the reality life to enrich the fantasy world and make its mark on the real world. (33 ref.)—*T. N. Webster.*

8321. Giordano de Zion, Mora. **La actitud fenomenológica en psicoterapia infanto-juvenil.** [Phenomenological attitude in psychotherapy of children and adolescents.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Jun), Vol. 16(2), 135-141.—Sug-

gests a phenomenological attitude in the psychotherapeutic task, when dealing with children and adolescents, and gives examples based on psychoanalytic and phenomenological interpretations of cases treated by her, and part of a case treated and published by Melanie Klein. (20 ref.)—*English summary.*

8322. Glasserman, María R. **La psicoprofilaxis quirúrgica: Una técnica de prevención.** [Surgical psychoprophylaxis: A preventive technique.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969, Vol. 15(3), 239-244.—Describes a preventive technique—surgical psychoprophylaxis—to be employed with both children and adults, individually or in groups, and aimed at preparing patients undergoing surgical intervention. The technique is dynamically oriented and consists of verbalizing and working through fantasies and anxieties related to the illness and the surgical intervention. Psychodramatic techniques, with graphic and play material, are also employed. Discusses the applicability of the technique in a wide variety of cases. (42 ref.)—*English summary.*

8323. Glasserman, María R. & Shuzki, Carlos E. **Psicoprofilaxis quirúrgica: Una investigación acerca de su efectividad.** [Surgical psychoprophylaxis: Research on its effectiveness.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969, Vol. 15(3), 261-264.—4-12 yr. old children to be surgically treated for strabismus were randomly assigned to either of 2 groups: one received surgical psychoprophylaxis, and the other did not receive any preparatory therapy for the surgical intervention. Ss were evaluated before and after (in a follow-up interview) the surgical and therapeutic procedures with a psychodiagnostic evaluation and an ad hoc objective scale for anxiety. Results show that the group receiving surgical psychoprophylaxis adapted to the surgical intervention better than did the control group. Implications for the validity of surgical psychoprophylaxis are discussed.—*V. A. Colotta.*

8324. Glazer, Henry. **Investment of the spirit.** *Journal of Emotional Education*, 1969(Win), Vol. 9(1), 12-17.—Describes the operant philosophy of translating the ideal of service into reality which is practiced at the Institute for Emotional Education (IFEE). IFEE is a nonresidential therapeutic community. "At IFEE, emphasis is not placed merely on personality changes for the sake of healthy adjustment to the outside world." Instead, the client is directed toward a life of service. 2 illustrative cases are presented.—*B. A. Stanton.*

8325. Graff, Barry D. (Michigan State U.) **Group therapy and individual therapy: A comparison.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1536.

8326. Greenson, Ralph R. **The exceptional position of the dream in psychoanalytic practice.** *Psychoanalytic Quarterly*, 1970(Oct), Vol. 39(4), 519-549.—Issue is taken with psychoanalysts who downgrade the importance of dream analysis. "The dream is an exceptional and unique production of the patient. It is his special creation but can only be fully understood if the analyst and the patient work together by means of the patient's free associations and the analyst's interpretations. To work effectively with a patient's dream the analyst must subordinate his own theoretical interests, his own personal curiosity, and attempt to make contact with what is living, accessible, and dominant in the patient's psychic life at the same time. He must associate empathically with the patient's life. Then he must

translate the pictures he gets from the patient's verbal rendering of the dream back into thoughts, ideas, and words. Finally, he must ask himself what of all of this will be valuable to the patient's conscious and reasonable ego and how he can say it effectively to the patient."—*J. Z. Elias.*

8327. Hartmann, Dora. **A study of drug-taking adolescents.** *Psychoanalytic Study of the Child*, 1969, Vol. 24, 384-398.

8328. Hawkey, Lawry. (Woodbury Down Child Guidance Clinic, London, England) **Case study of an adolescent girl.** *Journal of Analytical Psychology*, 1970(Jul), Vol. 15(2), 138-147.—Describes the treatment of an adolescent girl who was "full of fears particularly of anything happening to any member of the family An attempt has been made to show the setting in which treatment took place and to demonstrate both the method used and the patient's ability to respond to the treatment situation." S was in therapy for 4 yr., between the ages of 12-16. S was treated in a room also used for younger children, but never played with toys; however, she was able to use verbal communication. The treatment closely approximated adult therapy.—*P. Federman.*

8329. Hersen, Michel. (Fairfield Hills Hosp., Newton, Conn.) **The complementary use of behavior therapy and psychotherapy: Some comments.** *Psychological Record*, 1970(Sum), Vol. 20(3), 395-402.—Reports clinical evidence in support of the concurrent, successive, and complementary application of behavioral and traditional therapeutic techniques. The case histories reported point to the flexibility required in treating varied patient problems. Criticism is leveled at practitioners who maintain a particular therapeutic strategy only to be consistent with their theoretical underpinnings. It is argued that specific techniques are utilized most effectively when applied to specific difficulties in attainment of maximum benefit for patients. In the theoretical struggles that arise among practitioners of opposing camps, the patient should be of main concern. Empirical examination of the most effective treatment combinations appears warranted. (36 ref.)—*Journal abstract.*

8342. Oates, Wayne E. (Southern Baptist Theological Seminary, Louisville, Ky.) **Your partnership in emotional therapy.** *Pastoral Psychology*, 1969(Mar), Vol. 20(192), 44-51.—Family members, neighbors, fellow employees, and even casual friends can, if they are willing and teachable, play key roles in the therapeutic process. Comprehensive emotional therapy is discussed in terms of recognizing the emotionally disturbed, mobilizing the therapeutic team, the place of pastoral care in the therapeutic team, and the care of uncooperative disturbed persons. These modes of outreach are related to theological relationships.—O. Strunk.

8343. Osorio, Luiz C. (Therapeutic Community Leo Kanner, Porto Alegre, Brazil) **Therapeutic agents in an inpatient community for children.** *Acta Paedopsychiatrica*, 1970(Feb), Vol. 37(2-3), 56-61.—Children are organized in groups of 6-8, and together with child care workers, constitute small families integrated among themselves and into the residential community, divided into 3 therapeutic agents: the patient, the therapist, and community activities. The patient may act as a therapeutic agent and the psychiatrist's activities are in the last instance determined by the social behavior of the patients. On the child care worker, the child will project his parent images; thus, the selection of these workers is of maximum importance. To make adequate use of the psychopedagogic methods in the community, it is essential to base the occupational program on the patient's own aptitudes and preexisting tendencies. The 4th element in the therapeutic community is the patient's immediate family. Few institutions have so far been able to integrate the family-member part of the therapeutic team.—G. Rubin-Rabson.

8344. Razin, Andrew M. (Columbia U., Teachers Coll.) **A-B variable in psychotherapy: A critical review.** *Psychological Bulletin*, 1971(Jan), Vol. 75(1), 1-21.—Reviews research on the A-B classification of therapists under differential clinical outcome, personal characteristics, and analog studies. Outcome work found As more effective with schizophrenics than Bs, whether A-B status was defined by therapy behavior or vocational interests. Later work found Bs more effective with neurotics. Most recent data point to the importance of improvement criteria (As seem more successful in effecting subjective relief, and Bs, in effecting impulse control). Personal characteristic studies find As more trusting, intropunitive, and tolerant of "inner" experiences and spontaneity; more field dependent and personally involved with patients; and more oriented to problem solving than Bs. Largely because of methodological problems, analogs have yielded conflicting data, but they do suggest that, in extended dyadic contact, "complementary" pairings (neurotics with schizoids) are more effective than "similar" pairings (neurotics with neurotics, schizoids with schizoids). It is concluded that As share with and communicate to schizophrenics awareness of idiosyncratic perceptions and that As are able to persuade schizophrenics to trust them. (50 ref.)—*Journal abstract*.

8345. Redfearn, J. W. (30 Devonshire Pl., London, England) **Bodily experience in psychotherapy.** *British Journal of Medical Psychology*, 1970(Dec), Vol. 43(4), 301-312.—Discusses the relationship between the body image and the actual body. The former can be meaningfully used and integrated with other personal experience and feelings, and built into the common language of patient and psychotherapist. This body

scheme is part of a larger whole, which is termed the coenesthetic body-world scheme of impulsive-affective experience. The actual body and bodily processes act on this at all levels of experience. As part of the coenesthetic mechanism, both primitive and less primitive bodily impulses and instinctual behavior patterns may, particularly when motor discharge is blocked, create corresponding imagery. Analysis of narcissistic defenses eventually tends to reach a prepersonal level where these bodily impulses with their corresponding images may be brought into relationships with the ego and the body, often within the transference relationship. A series of clinical examples is used to demonstrate these phenomena. These examples also show the main vicissitudes of narcissistic libido and its relationship with bodily disturbances and clinical practice. The main types of splitting and projection which are encountered, as well as possible ways of dealing with these splits, are discussed. A case is described in which actual work on the body is combined with psychotherapy, in an effort to deal with psychosomatic splitting.—*Journal summary*.

8346. Rossi, Romolo. **Equivalenti caratteriali di psicosi periodica bipolare: Problemi psicoterapeutici.** [Character equivalents of the bipolar period of psychosis: Psychotherapeutic problems.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 399-404.—Compared 2 cases. In the 1st there is a doubt concerning the endogenous phase, because of the impossibility of outlining dynamic movements from the concrete reality of the clinic. In the 2nd, which is a classical case of bipolar psychosis, there is no doubt, and the S administers the necessary drug himself. It is concluded that: (a) The endogenous modification phase of a bipolar type presents itself under the aspect of characteristic equivalents and is considered a psychotherapeutic problem. (b) The psychotherapeutic situation is the best for recognizing the endogenous equivalent because the psychiatrist has continuous and deep contact with the patient, and a precise graph of the changing phases can be traced. (c) The administering of antidepressive and neuroleptic drugs is essential in treating bipolar psychosis. The psychotherapeutic situation is the best to catch the moment of "shifting" from high to low. It is a mistake for the psychiatrist to refuse the assistance of drugs. (d) The psychotherapist must solve the problem in a doctor-drug-patient relationship. (24 ref.)—A. M. Farfaglia.

8347. Schwartz, Mildred R. (New York U.) **Affective communication in psychotherapy.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1550.

8348. Silber, Austin. (State U. New York, Downstate Medical Center, Brooklyn) **An addendum to the technique of psychotherapy with alcoholics.** *Journal of Nervous & Mental Disease*, 1970(Jun), Vol. 150(6), 423-437.—Attempts to modify the approach to psychotherapy for the alcoholic patient. Since the attitude of the therapist toward alcoholism and his alcoholic patient is crucial, the manner in which the therapist should institute therapy is carefully outlined. Alcoholism as a symptom with its unique characteristics is defined, as is symptom formation in general. A therapeutic working compact between therapist and patient, and its similarity with the working alliance in psychoanalytical treatment, is discussed. The significance of the therapist's ego being lent in a prosthetic sense to repair damaged ego functions in the patient and to cement the therapeutic working compact is highlighted. The frequent finding of

a pathologically ill parent in the background of alcoholic patients seen in therapy is noted. The effects of this on the alcoholic and his treatment are discussed. Modifications of technique, based on an altered perspective are detailed. (32 ref.)—*Journal abstract.*

8349. Strupp, Hans H. (Vanderbilt U.) **Specific vs. nonspecific factors in psychotherapy and the problem of control.** *Archives of General Psychiatry*, 1970(Nov), Vol. 23(5), 393-401.—Examines the relative contributions of specific techniques and such nonspecific factors as the patient's expectations and feelings of trust in determining psychotherapeutic outcome. It was hypothesized that changes due to specific techniques can be quantitatively and qualitatively differentiated from nonspecific influences. Difficulties in obtaining empirical support for this hypothesis are discussed. It is concluded that fruitful research must focus on both subjective and objective aspects of the individual's functioning.—*P. McMillan.*

8350. Tinstman, Shirley O. (U. Oklahoma) **Experimenter bias and the effects of psychotherapy.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1552-1553.

8351. Vera, Luis & Thieberger, Jorge. **Un estudio sobre deserción de pacientes: Experiencia de residentes en consultorios externos de un hospital psiquiátrico.** [A study of desertion of patients: Experience of residents in out-patient department of a psychiatric hospital.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Mar), Vol. 16(1), 57-61.—Reports a study on desertion by psychiatric patients carried out on all 1st admissions (N = 164) during July and August, 1968, in an Argentinian hospital. Overall treatment desertion percentage was 41%. Breakdown according to diagnostic categories yielded the following desertion percentages: psychoneurotics 50%; schizophrenics 33%; alcoholics 43%; epileptics 18%; and other 40%. The main causes for desertion were: unknown (18 Ss); lack of motivation (13 Ss); pathology (13 Ss); inappropriate handling (9 Ss); other (15 Ss). Suggestions are given to decrease desertion rates in psychiatric hospitals.—*V. A. Colotta.*

8353. Zysman, Samuel. **Las psicoterapias breves: Elección o necesidad?** [Brief psychotherapies: Choice or necessity?] *Acta Psiquiátrica y Psicológica de América Latina*, 1969, Vol. 15(3), 245-250.—Points out the need for placing brief psychotherapies, together with other techniques, on the basis of a common theoretical ground. In this way, a false opposition between "long" and "brief" psychotherapies is avoided, and each will take its proper place in the vast field of psychotherapies. This will allow the therapist to choose correctly among them all, according to the peculiarities of each case and the different indications, limitations, and advantages of the techniques. Discusses the basic characteristics to be exhibited by the doctor, the patient, and the procedure itself in order to better accomplish the therapeutic goals.—*English summary.*

Therapeutic Process

8354. Antonelli, Romano. **Commenti sulla motivazione psicoterapica nei caratteropatichi.** [Comments on psychotherapeutic motivation in patients with

character disorders.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 362-364.—The psychiatrist must try to understand the factor or factors which made the patient seek psychiatric help. A patient who accepts therapeutic treatment only because the rich wife threatens or because he hopes for clemency from the court cannot benefit from psychotherapy. The source of the anxiety is not discovered. A case is studied showing the patient making no progress until he recognized the exact moment and event which made him seek out psychiatric help. The question "Why does this person seek help?" is the 1st thing the psychiatrist must answer regarding the subjective perception of the anxiety.—*A. M. Farfaglia.*

8355. Bleichmar, Emilce D. **Terminación de análisis de niños: Contrato de terminación.** [Termination of child analysis: Contract of ending.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969, Vol. 15(3), 265-270.—Describes psychoanalytic processes during treatment of children and at the moment of termination. The need for setting a contract of termination with the child is stressed. 3 situations that can arise are defined: (a) termination of analysis; (b) interruption by reasons not related to the analyst; and (c) interruption performed by the analyst himself. Illustrative clinical material is provided.—*English summary.*

8356. Brandt, Lewis W. (U. Saskatchewan, Regina, Canada) **Der nicht-beobachtende Teilnehmer: Die Integration des Rollenspiels in die Psychoanalyse.** [The non-observed participant: Integration of role playing in psychoanalysis.] *Schweizer Archiv für Neurologie, Neurochirurgie und Psychiatrie*, 1971, Vol. 108(1), 1-13.—Classical psychoanalysis requires a self-observing ego which many analysts have not yet developed. To assist its development the analyst may play the role of the superego, the ego-ideal, or introjected objects or he may side with the resistances. Infantile, negativistic, and/or aggressive analysts can thus concretely deal with their resistances in the person of the analyst. Their ego gains strength in this confrontation and they become amenable to interpretations which they previously rejected or could not make any use of. Some illustrative examples are presented from the author's practice. (French summary)—*English summary.*

8358. Hill, James A., Howard, Kenneth I., & Orlinsky, David E. (Inst. for Juvenile Research, Chicago, Ill.) **The therapist's experience of psychotherapy: Some dimensions and determinants.** *Multivariate Behavioral Research*, 1970(Oct), Vol. 5(4), 435-451.—Factor analytically derived 11 dimensions of therapists' experiences during psychotherapy sessions for a sample of 17 therapists. Ss completed a standard questionnaire after each of 8 or more sessions with 31 female patients. In general, the dimensions reflected experiences of (a) being helpful towards patients, (b) attempting to deal with difficult patients, (c) making nontherapeutic responses to patients, and (d) entrapment in personally distressing situations with patients. Personal-social characteristics of patients and Ss were examined as possible determinants of therapist experience. Among other characteristics, patients' employment and marital status, diagnosis, and previous treatment, influenced certain therapist experience dimensions—as did Ss' profession, marital status, and personal psychotherapy.—*Journal abstract.*

8359. Landfield, A. W. (U. Missouri) **High priests, reflexivity and congruency of client-therapist personal construct systems.** *British Journal of Medical Psychology*, 1970(Sep), Vol. 43(3), 207-212.—The psychology of "personal constructs" is a theory of theories which has ramifications for how we understand and interact with our fellow men. This theory is 1 alternative to those theoretical constructions which treat men as noncreative, reactive robots, whose worth is judged by how well they do what they are supposed to do. Working within this alternative theory of personal constructs, focus is placed on the implications of client-therapist congruency in the content and organization of their construct systems.—*Journal summary*.
8360. Mattsson, Ake. (U. Virginia) **The male therapist and the female adolescent patient.** *Journal of the American Academy of Child Psychiatry*, 1970(Oct), Vol. 9(4), 707-721.—Reviews the recent literature regarding the significance of the gender of the adolescent patient's therapist and presents 6 case studies from a male psychotherapist's work with pre- and early adolescent girls. It is concluded that "a male therapist may expect to do as effective psychotherapeutic work with an adolescent girl as with an adolescent boy." 2 exceptions to this are noted: (a) cases where the female S's tension and bewilderment caused by biopsychological changes make her especially anxious and embarrassed with a male therapist, and (b) cases where a sexualized relationship occurs early in treatment. It is further concluded that "the transference reactions seen in work with adolescents are not determined basically by the therapist's sex," and the "the male therapist can become the object of either father or mother transference which can be interpreted to his patient, whether the latter is male or female." (18 ref.)—*M. Maney*.

8362. Mullen, John & Abeles, Norman. (Wisconsin State U.) **Relationship of liking, empathy, and therapist's experience to outcome of therapy.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 39-43.—Scored tape recordings representing samples of 396 recorded interviews from the completed cases of 36 clients for accurate empathy and liking. Each client was seen by a different therapist, and clients were divided into a successful and an unsuccessful therapy-outcome group based on changes of pre-post MMPI clinical scales. Results indicate that high liking and high empathy together did not predict successful outcome, though a post hoc analysis showed a positive relationship between high empathy alone and successful outcome. Results also indicate that inexperienced therapists were generally less empathic than experienced therapists. Finally, for experienced therapists, accurate empathy and liking were not related while the relationship for these variables was significant with inexperienced therapists. (19 ref.)—*Journal abstract*.

8364. Older, Jules. (New York U.) **Pseudo-testing.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1547.
8365. Slater, P. (Inst. of Psychiatry, London, England) **Personal questionnaire data treated as forming a repertory grid.** *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 357-370.—Analyzed data obtained by giving a personal questionnaire to a patient on a series of occasions during treatment for a psychiatric disorder, using the standard program provided by the Medical Research Council Service for analyzing repertory grids. Results identify the plane where the greatest fluctuations occurred in S's mental state (including 72% of the total variation) and provide coordinates for mapping the very complicated course the fluctuations followed. Further analyses enabled changes after psychotherapy and occupational therapy to be compared. The complete procedure for collecting such data and submitting them to analysis offers interesting possibilities for monitoring a patient's progress and comparing his responses to different forms of treatment. It widens the range of psychological phenomena that can be brought within the range of measurement.—*Journal abstract*.
8366. Tupin, Joe P. & Overall, John E. (U. California, Medical School, Davis) **Further investigation of factors affecting outcome in a doctor's choice treatment setting.** *Diseases of the Nervous System*, 1970(Oct), Vol. 31(10), 684-694.—Reports results of the 2nd phase of a study evaluating clinical procedures and applying these methods to a natural clinical setting. Ss were 451 consecutive admissions to an inpatient psychiatric service who had been hospitalized for at least 2 wk. Excluded from the study were Ss with diagnoses of mania and organic syndromes. A detailed history was obtained on each S, as well as demographic and background characteristics. Analyses compared treatment methods, major diagnostic groups, and selected demographic variables. Primary sources of variance in outcome ratings included alcohol, S's behavior, sex, clinical diagnoses, and the use of convulsive therapy. Results indicate that marital status and children were significant factors in response to antidepressants and major tranquilizers. Overall differences in drug effects were conspicuously small, however. There was no statistically significant confirmation that "response to different major types of drug treatments was specific to broad clinical diagnostic categories."—*P. McMillan*.

Group Therapy

8367. Bleichmar, Hugo B. (Prof. G. Araoz Alfaro Polyclinic, Provincia de Lanus, Argentina) **El sistema familiar: Teoría de la técnica de psicoterapia.** [The family system: Theory of the technique of psychotherapy.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Jun), Vol. 16(2), 148-154.—Examines the various subsystems that integrate the family therapeutic group and the relations between them. The different kinds of interpretations the therapist can make, and the role played by transference interpretations within the family as a whole are discussed. The family is conceptualized as an open system and a gradient is suggested to indicate the amount of permeability present in the families concerning their interchange with the therapist, as a representative of the exogroup. (15 ref.)—*English summary*.

8368. Bruyning, F. **Voorlopig ontwerp van een kader voor het beschrijven en plannen van gezinstherapie.** [Introductory design with reference to

outlining and planning for family therapy.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Sep), Vol. 25(8), 533-559.—Attempts to analyze some aspects of conjoint family therapy from the viewpoint of planned-change theory. This planned change consists of 3 phases: explorative, operational, and appraisal. Explorative consists of the study of the interaction of family members. This is described by the power function of each member, what form of behavior is considered to be normal by each member and by other members of the group, and the cohesiveness of the family as measured by the concern of each member for the welfare of the others. Operational consists of management planning, such as identifying the factors within and without the family system that could cause or alleviate the family disruption. It also includes the choice of strategic and tactical devices to improve the family climate. Appraisal includes the evaluative techniques. These phases are illustrated by case study. The systematic design of the study is described as being apropos to the therapy of an individual or a group, regardless whether the theory of the therapist emphasizes psychoanalysis, learning or transactional theories.—*A. J. Ter Keurst*.

8369. Clark, James V. (U. California, Graduate School of Business Administration, Los Angeles) **Task group therapy: I. Goals and the client system.** *Human Relations*, 1970(Aug), Vol. 23(4), 263-277.—Discusses the organization and functioning of "task group therapy," with its focus on interactional systems rather than on intrapsychic dynamics. Patterns of interaction are described, particularly the self-defeating behavior which characterizes task groups facing the most uncertainty. This behavior is self-defeating for group members' needs to relate satisfactorily to their task and each other. The associated incongruent double-bind communication patterns are strikingly similar to those seen in severely disturbed families.—*W. W. Meissner*.

8370. D'Angelo, R. Joseph. (United States International U., San Diego, Calif.) **Relationships among agreement with therapist and self-concept changes.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1532.

An interpretation is given of the appearance and use of ruled games by children, in Piagetian, developmental terms, and psychoanalysis. (19 ref.)—*English summary*.

8372. Fisko, Adam. (Illinois Inst. of Technology) **Vicarious vs. participant group psychotherapy of underachievers.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 912.

8373. Fraas, Louis A. **The patient-corpsman within a milieu therapy setting: A further approach to the manpower shortage.** *Military Medicine*, 1970(Nov), Vol. 135(11), 1011-1013.—A therapeutic milieu used in an overseas Army psychiatric center proved ineffective in reducing the number and extent of acting-out ward behavior. In order to combat this, psychiatric patients who were posing character problems were encouraged to

act as corpsman during their hospital stay. In this capacity, they were to engage other psychiatric patients and be partially responsible for their treatment. This procedure demonstrably reduced the frequency of acting-out behavior in this setting.—*G. A. Chum*.

8374. Gagnon, Jacques. (Mental Health Clinic of 13eme Arrondissement, Paris, France) **La psychothérapie analytique de groupe chez les préadolescents.** [Analytical group psychotherapy of preadolescents.] *Laval Médical*, 1969(Dec), Vol. 40(10), 1028-1036.—The fundamental criteria of psychoanalysis are found in analytical group psychotherapy. The neutral attitude of the therapist, his attention oriented toward seeking the common unconscious phantasm and his position of interpreting transference favors the elaboration of a vertical relationship over lateral transferences. During the prepubertal period impulsive drives are poorly differentiated. Physical and intellectual inferiority is compensated for by the spontaneous make up of the group. Behavior disorders and neuroses observed during this period are also poorly differentiated. Child therapists have adapted several formulas and derived from their ecological training therapies based on attitudes, abreaction, or interpretation of transference. Whatever the method, group therapy appears to satisfy the social need of preadolescents. These individuals encounter a certain difficulty in conceptualization; for this reason an approach using play, drawing, and other modes of expression is favored. It remains only for the therapist to impart to the technique his tastes and personality making him more effective.—*English abstract*.

8375. Gendzel, Ivan B. (Stanford U. Hosp., Palo Alto, Calif.) **Marathon group therapy and nonverbal methods.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 286-290.—Outlines the structure of a 24-hr encounter group (marathon) meeting. The number of participants ranged from 14-18 and initially consisted of either couples or singles. Nonverbal methods were felt to be effective in circumventing verbal barriers, conceptualizing and verbalizing new and unusual experiences, and providing much relevant information. The majority of 100 participants responding to a questionnaire immediately after their marathons felt they had benefited from the experience and that the nonverbal methods had contributed. A follow-up meeting several wk. after the marathon helped to provide closure to the experience. (17 ref.)—*Journal abstract*.

New York) **Ethical considerations in leading therapeutic and quasi-therapeutic groups: Encounter and sensitivity groups.** *Group Psychotherapy & Psychodrama*, 1970, Vol. 23(1-2), 17-20.—While therapeutic groups of a traditional nature are normally directed by professionals required to adhere to various legal and ethical standards, thereby protecting the "customer," new quasi-therapeutic groups often do not have such leaders. It is suggested that such groups should be covered by their own ethical standards so as to protect the public from false advertising, harmful experiences, and the freedom of choice to stay or leave. (15 ref.)—*A. Krichev*.

8378. Langsley, Donald G., Flomenhaft, Kalman, & Machotka, Pavel. (U. California, Medical School, Davis)

Followup evaluation of family crisis therapy. *American Journal of Orthopsychiatry*, 1969(Oct), Vol. 39(5), 753-759.—6-mo follow-up evaluations of 150 family crisis therapy cases and 150 hospital treatment cases demonstrate that those treated as outpatients do as well as the hospital cases. Social functioning is maintained equally in both groups. Patients are less likely to be rehospitalized if admission was avoided initially.—*Journal abstract*.

8379. Mastropaulo, Camillo & Vannucci, Liliana. **Indicazioni, limiti e prime esperienze personali in tema di terapia di gruppo nella dissocialita' minorile.** [Indications, limits, and primary personal experiences on the subject of group therapy in the dissociation of minors.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 337-343.—Important limitations in the psychotherapy of adolescents are (a) the hesitant acceptance of psychotherapeutic rapport on the part of youth; (b) possible harm which can be exercised on the part of adults, e.g., ill prepared educators; and (c) the particular pathology of the adolescent. A study was conducted at an institute for minors during 1 yr. with 41 adolescents who had an IQ >80. Ss were examined through neurological testing, psychiatric interview, and interview with 1 or both parents, and then were divided into 3 groups, according to age and length of time at the institute. Each group, composed of 7-8 youths, attended 1 weekly sitting with 1 or 2 psychotherapists. The intervention of psychotherapy was not authoritarian and techniques were used which were imperceptible to the S, thus eliminating the emergence of a "Leader." The therapist recognized as an authoritarian leader without a punitive role could begin a constructive dialog making them accept the nature of their conflicts. There gradually took place an inversion of identity, and an acceptance of the ethical principles toward a positive role in the society. (15 ref.)—A. M. Farfaglia.

8380. McKinley, Cameron K., Ritchie, Agnes M., Griffin, Darrell, & Bondurant, William. (U. Texas, Medical School, Galveston) **The upward mobile Negro family in therapy.** *Diseases of the Nervous System*, 1970(Oct), Vol. 31(10), 710-715.—Describes experiences while working psychotherapeutically with 3 middle-class Negro families who had been initially referred for multiple impact family therapy, as part of an original research sample. Striking similarities in family structure and functioning were noted. It was found that the families were seriously disorganized and poorly integrated, though superficially "intact." Marital relationships also revealed differences from white middle-class family counterparts in terms of role definition. Sibling relationships were judged weak, with each sibling being primarily concerned with his own welfare. Difficulties in communication and understanding between therapist and patients were noted. However, a role reversal adaptation of psychodrama techniques was unexpectedly effective in weakening the barrier between white therapist and black families.—P. McMillan.

8381. McPherson, F. M. & Walton, H. J. (Royal Edinburgh Hosp., Scotland) **The dimensions of psychotherapy group interaction: An analysis of clinicians' constructs.** *British Journal of Medical Psychology*, 1970(Sep), Vol. 43(3), 281-290.—7 experienced clinicians observed at least 25 meetings of a psychotherapy group and then described the intragroup interactions of the patient members, using repertory grid technique. A principal component analysis of the

combined grids isolated 3 main independent dimensions, differentiating group members who are assertive and dominant from those who are passive and submissive; who are emotionally sensitive to other members as opposed to insensitive; and who hinder rather than aid the attainment of group goals. (35 ref.)—*Journal summary*.

8382. Moreno, J. L. (Moreno Inst., Beacon, N.Y.) **The triadic system, psychodrama-sociometry-group psychotherapy.** *Group Psychotherapy & Psychodrama*, 1970(Vol. 23(1-2)), 16.—Presents a brief statement of Moreno's merger of group psychotherapy, psychodrama, and sociometry into a single system.—A. Krichev.

8383. O'Connell, Walter E. & Hanson, Philip G. (Veterans Administration Hosp., Houston, Tex.) **The protagonist in human relations training.** *Group Psychotherapy & Psychodrama*, 1970(Vol. 23(1-2)), 45-55.—36 protagonists were found to have considerable improvement in a number of areas of self-esteem and interpersonal relationships as compared to 36 non-protagonists who went through the same psychodrama sessions. Some errors in the research design are noted with plans for future improvement.—A. Krichev.

8384. Rubes, Jaromir. [Public psychodrama in Prague.] *Group Psychotherapy & Psychodrama*, 1970, Vol. 23(1-2), 57-59.

8385. Warner, G. Douglas. (1010 Woodland Way, Hagerstown, Md.) **The didactic auxiliary chair.** *Group Psychotherapy & Psychodrama*, 1970, Vol. 23(1-2), 31-34.—Describes the use of the didactic auxiliary (empty) chair in psychodrama and points out its use as a warm-up device or as a progressive learning instrument. It is seen as being especially valuable for public sessions and special group meetings.—A. Krichev.

8386. Zumpe, V., Veltin, A., & Krüger, H. (U. Münster, W. Germany) **Die verbale Kommunikation in der therapeutischen Gruppe.** [Verbal communication in the therapeutic group.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1970(Jul), Vol. 20(4), 139-146.—Investigated the verbal actions of mental patients in group sessions on a ward organized as a therapeutic community. Results show that (a) discussion participation by Ss was more intensive in smaller groups of 15-18 than in larger groups, (b) more topics were discussed by groups of chronic Ss than by Ss with shorter hospitalization, and (c) the number of topics discussed was independent of the number of group participants. The differing behavior of changing discussion leaders had no effect on discussion participation. However, it did influence the number of topics suggested for discussion.—*English summary*.

Behavior & Conditioning Therapy

8387. Ball, Thomas S. (Pacific State Hosp., Pomona, Calif.) **Training generalized imitation: Variations on an historical theme.** *American Journal of Mental Deficiency*, 1970(Sep), Vol. 75(2), 135-141.—Relates some contemporary work on imitation training conducted by behavioral therapists to historic contributions. It is argued that recent work on imitation training fails to include even a cursory acknowledgement of the contributions of J. M. Itard and R. Seguin. The work of these 19th century pioneers anticipated the general aspects of imitation training and its technical specifics. Seguin's "mimical generalization" encompasses the modern definition of generalized imitation. In a speech

training program corresponding closely to those of O. I. Lovaas and D. M. Baer, Seguin faded physical prompts much as they did. In his "method of insensible gradation," Itard not only anticipated Skinnerian successive approximations, but applied it clinically, precisely as did W. Isaacs, while restoring speech in a mute catatonic. Itard's letter connection task remains perhaps the most rigorous test of generalized imitation ever devised.—*Journal abstract.*

8388. Bartz, Wayne R. & Loy, Donald L. (DeWitt State Hosp., Auburn, Calif.) **Using love in behavior therapy.** *Hospital & Community Psychiatry*, 1970(Oct), Vol. 21(10), 333-334.—Successful behavior therapy results are often attributed to factors other than those embodied in reinforcement learning theory. 1 such argument is that results may be due to the love the patient receives from the therapist(s). Behaviorists are aware of the value of human warmth and praise but differ from therapists who give unconditional love in that the former apply love in a systematic, consistent manner (e.g., positive reinforcement given for desirable behavior). It is not attention that is the important variable but the contingencies between behavior and reinforcement. Love becomes an important factor only when the S has been conditioned to enjoy human contacts and affection. Attention given indiscriminately may actually maintain maladaptive behavior.—*R. B. Sivley.*

8389. Bergold, J. B. (U. Munich, W. Germany) **Ziele und Methoden der Verhaltenstherapie.** [Goals and methods of behavior therapy.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1970(Jul), Vol. 20(4), 153-162.—Briefly delineates the most important methods of behavior therapy. The goal of behavior therapy is not just the modification of specific false behavior patterns, but attempts to aid the patient in achieving improved control over his own behavior. Treatment is conducted in 2 phases: behavior analysis and behavior modification. The behavior analysis is the presupposition for drafting the treatment plan. During this phase data are collected which provide a check on the effectiveness of the behavioral modification phase. The procedures in behavioral therapy can be divided roughly into 3 categories. The selection of a procedure is dependent upon the functional context within which the false behavior pattern occurs.—*English summary.*

8390. Carter, Robert D. & Stuart, Richard B. (U. Michigan, School of Social Work) **Behavior modification theory and practice: A reply.** *Social Work*, 1970(Jan), Vol. 15(1), 37-50.—Points out certain misconceptions contained in criticisms of behavior modification theory and practice. It is argued that the behavioral approach has been empirically demonstrated to be effective in altering problem behavior and that, because of its close ties to experimental psychology and its insistence on operational specificity and conceptual parsimony, it offers decided advantages over more traditional psychodynamic approaches. Specific issues are discussed, and it is proposed that behavioral psychology can deal adequately with all important aspects of complex human behavior.—*Journal abstract.*

8391. de Moor, W. **Gedragstherapie: Een algemeen overzicht.** [Behavior therapy: A review.] *Gawein*, 1969(Dec), Vol. 18(2), 79-117.—Attempts to provide an overview of behavior therapy. The discussion is organized around the questions of "What is the essence of behavior therapy?" and "What characterizes a behavior therapist?" Particular attention is given to the

Dollard-Miller tradition, and the classical and operant conditioning therapies, within historical framework. The most important of the techniques is based on classical conditioning principles and the specific contributions of the behavioristic approach are considered in more detail. (104 ref.)—*English summary.*

8392. DeResi, William J. (U. Utah) **A conditioning approach to the treatment of bruxism.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1532-1533.

8393. Farmer, R. G. (U. New South Wales, Kensington, South Australia) **The team approach in gaining therapeutic experience in eclectic behaviour therapy.** *Australian Psychologist*, 1970(Jul), Vol. 5(2), 157-163.—The eclectic behavior therapist must endeavor to be eclectic even within his own discipline, and should not only be aware of, and be willing to apply in practice, findings from research in the area of behavior therapy itself, but should also consider developments outside this domain. In developing a training program to produce this kind of therapist, with heavy undergraduate emphasis on learning theories, psychophysiology, and research methodology, the most effective way to give postgraduate training in eclectic behavior therapy is to involve the trainee from the beginning, even in fairly difficult cases, in a team approach to therapy. Such a team, consisting of 2 experienced behavior therapists and 8 trainee therapists, functioning in a school of applied psychology is described. Team members usually meet only when the need arises, but also have more formal meetings to discuss theoretical issues; this interaction between team members can form a vital part in the training of eclectic therapists. Examples cited of this team approach in training include treatment of a school phobic boy, applying group desensitization techniques to a group of women with sex disorders, and aversion therapy of alcoholics.—*T. N. Webster.*

8394. Krasner, Leonard. (State U. New York, Stony Brook) [Token economy as a prototype of a behavior modification program.] *Gawein*, 1969(Dec), Vol. 18(2), 118-129.—Describes the history and the basic principles of token economy as being a prototype of behavior modification. It is explained how token economy utilizes the findings of operant conditioning and of experimental and social psychology systematically in directly modifying the behavior of disturbed and "normal" individuals. In a token economy program the emphasis is not on the extinction of undesirable behavior, but on the reinforcement of desired behavior and on the development of personal responsibility. A token program involves the designation of certain behaviors as desirable, hence reinforcing; a medium of exchange, the token; and the back-up reinforcers. The current disease model in psychopathology is rejected, replacing it with a social learning model. As in all forms of therapy, value questions play a part in any token economy program. (16 ref.)—*English summary.*

8395. Liberman, Robert. (National Inst. of Mental Health, Washington, D.C.) **Terapia conductual de familias y de parejas.** [Behavior therapy of couples and families.] *Revista Latinoamericana de Psicología*, 1970, Vol. 2(2), 161-182.—A behavioral and learning approach to couple and family therapy involves 3 steps: (a) specifying in concrete terms the problematic behavior or lack of behavior in or between members of the unit; (b) doing a functional analysis of the problem behavior(s) in

which the environmental and interpersonal contingencies maintaining the behavior(s) are elucidated; and (c) developing and experimenting in an empirical way with various techniques derived from principles of learning (e.g., reinforcement and modeling) so that alterations can be made in the interpersonal milieu that will enable more adaptive and satisfying behavior patterns to substitute for the problematic ones. The key to successful couple or family therapy, whatever the theoretical positions of the therapists, can be found in the changes made in the interpersonal consequences of the member's behavior. 8397. Ramírez, Fortunato. (Clínica Psiquiátrica, Medical School, Montevideo, Uruguay) **Integración de un procedimiento de psicoterapia de tipo dinámico-conductual.** [Integration of a dynamic-behavioral psychotherapeutic method.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Jun), Vol. 16(2), 125-134.—Describes a new therapeutic method combining dynamic and behavioral procedures. The 3 successive stages are (a) Schultz' autogenic training, (b) Wolpe's reciprocal inhibition therapy, and (c) inhibition by means of morbid patterns (developed by the author). The main contention is symptom elimination, as achieved by behavioral therapy, and should be supplemented by additional, dynamic treatment, aimed to achieve "insight" in the patient.—*English summary.*

8398. Rey, E. R. (Max Planck Inst. für Psychiatrie, Munich, W. Germany) **Anwendungsbeispiele der Verhaltenstherapie bei der Behandlung von Psychosen.** [Examples of the application of behavior therapy in the treatment of psychoses.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1970(Jul), Vol. 20(4), 162-168.—Discusses behavior therapy in the rehabilitation of psychotics, particularly schizophrenics, and gives illustrative examples from the literature. The treatment of various symptoms, especially thought disturbances in more acute patients, are described. It is possible to achieve improvement in chronic patients by means of a ward setup using behavior therapy. However, these treatment techniques require an attitude adjustment on the part of the therapists regarding their patients.—*English summary.*

8399. Sturm, Thomas E. (U. Minnesota) **The systematic use of positive reinforcement in the treatment of functionally mentally ill adult outpatients.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1552.

8400. Tunner, W. (U. Munich, W. Germany) **Allgemeine theoretische Grundlagen der Verhaltenstherapie.** [General theoretical bases of behavior therapy.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1970(Jul), Vol. 20(4), 147-153.—Attempts to bring therapeutic modification of behavior disturbances under experimental control. Learning principles from classical and operant conditioning are delineated which belong to the fundamental understanding of behavioral therapy considerations. Reference is made to various therapeutic methods. (17 ref.)—*English summary.*

8401. Yates, Aubrey J. (U. Western Australia, Perth) **La definición de terapia conductual.** [The definition of behavior therapy.] *Revista Latinoamericana de Psicología*, 1970, Vol. 2(2), 113-122.—Critiques Eysenck's definition of behavior therapy as "the attempt to alter

human behavior and emotion in a beneficial manner according to the laws of modern learning theory," and offers an alternative definition which stresses the application of the experimental method to the study of the individual patient. It is argued that this definition more adequately represents those features of behavior therapy which clearly distinguish it from other therapies which may also make use of learning theory. (20 ref.)—*English abstract.*

Special & Adjunctive Therapy

8402. Ceccarelli, Giorgi & Capani, Ruggero. **Prime esperienze di tecnica sociodrammatica nel trattamento dei caratteropatolici.** [Beginning experiments with sociodramatic techniques in the treatment of character disorders.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 369-371.—Sociodramatic concepts are based on the principle that each individual maintains the roles that govern his behavior and, thus, condition his relationship with others. In sociodramatic experiments, a purely recreative situation is transformed into a situation through which the Ss can act out different roles, releasing tensions and thereby determining why he tends to isolate himself. The theatrical situations are a repetition of normal life, an expression of the desires of the community, and a representation of personality analysis. 2 cases of defensive and aggressive women were studied. They were hostile to therapeutic help but gladly participated in the representations. They chose roles opposite their general behavior, thereby expressing their repressed tendencies to roles in a society judged hostile through an immature idealization.—*A. M. Farfaglia.*

8403. Crosa, Giuseppe. **Il training autogeno nel trattamento dell'caratteropatie.** [Autogenic training in the treatment of character disorders.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 381-384.—Asserts that the autogenic training of Schultz is beneficial in the treatment of character disorders by confronting the profound psychological dynamics of the S and his profound neurological dynamics. The treatment of these 2 factors is considered the greatest value of Schultz' technique. It offers precise reference points by which the doctor can reach the patient, and has pliability in adapting to the clinical situation. The therapist can stress the somatic neurological mechanisms as well as the profound psychological dynamics. The autogenic state, like the hypnotic trance, is characterized by a condition of passivity which facilitates the acceptance of induced suggestions which influence behavior.—*A. M. Farfaglia.*

8404. Fusswerk-Fursay. **Crédibilité ou faculté de croire.** [Credibility or faculty to believe.] *Annales Médico-Psychologiques*, 1970(Jun), Vol. 2(1), 1-25.—Presents 2 case histories centering on distortions of belief treated by hypnoanalysis; 1 a state of pathological jealousy, the other of persecutory delusion. Belief is held to be neither an intellectual process nor a direct affective experience. It represents a determining element of psychic life in itself which must find an autonomous place alongside intelligence and affectivity in the study of personality. When faulty beliefs learned in infancy, based on fear and sex drives, come into conflict with current situations the problems cannot be resolved by cognitive analysis alone, but only by exposure and reeducation of the originally faulty belief systems.—*H. E. King.*

8405. Miura, Momoshige & Usa, Shin-ichi. (Tottori U., Yonago City, Japan) **A psychotherapy of neurosis:**

Morita therapy. *Psychologia: An International Journal of Psychology in the Orient*, 1970(Mar), Vol. 13(1), 18-34.—Describes the origins of Morita therapy, the theory of "nervosity," classification and statistics of nervosity, principles of Morita therapy, practice of Morita therapy, recovery by Morita therapy, and criticism of Morita therapy. Nervosity is classified into 3 main overlapping headings corresponding to neurasthenia, anxiety neurosis, and phobia. The method aims to change an underlying hypochondriac temperament and destroy the psychic interaction in which the patient is caught. 4 stages of treatment are described. Japanese therapists recognize many points of similarity between Morita therapy and Frankl's logotherapy. (109 ref.)—*R. D. Nance.*

8406. **Morris, Freda.** (U. California, Neuropsychiatric Inst., Los Angeles) **Mutual hypnosis: A specialized hypnotic induction technique.** *American Journal of Clinical Hypnosis*, 1970(Oct), Vol. 13(2), 90-94.—A hypnosis instructor of mental health professionals recommends that the technique of mutual hypnosis be used with certain students who are unable to respond to other induction techniques.—*M. V. Kline.*

8407. **Segel, Harold J.** (Psychology Inst., Northridge, Calif.) **Psychotherapy vs. hypnotherapy in the treatment of sex problems.** *American Journal of Clinical Hypnosis*, 1970(Oct), Vol. 13(2), 128-130.—Reports the differential effectiveness of psychotherapy and hypnosis in treating impotence in a small number of clients.—*M. V. Kline.*

8408. **Small, Joyce G., Small, Iver F., Perez, Helio C., & Sharpley, Patricia.** (Indiana U., Medical School, Indianapolis) **Electroencephalographic and neurophysiological studies of electrically induced seizures.** *Journal of Nervous & Mental Disease*, 1970(Jun), Vol. 150(6), 479-489.—Identified similar interictal EEG findings in 85 patients who received bilateral or unilateral ECT treatment. Recordings during the seizures revealed significant differences between these treatment modalities with lateralized emphasis of seizure discharges and absence of postictal isoelectric activity with unilateral stimulation. Interictal evoked response data did not show consistent right-left asymmetries with electrical stimulation on either 1 or both sides of the head, but early peak latencies of averaged responses to light and sound stimulation tended to increase during ECT with maximal changes after the 5th treatment. Unilateral convulsive treatment seemed to be as therapeutically effective as bilaterally induced seizures in terms of clinical condition on follow-up, although more symptoms of psychiatric illness were evident in the unilateral group at the time of termination of the treatment series. Bilateral ECT was definitely associated with more memory loss, confusion, and impaired test performance than unilateral ECT. Interictal neuropsychological evaluations did not confirm simple or direct relationships between decrements in verbal and nonverbal functions and the side of electrical stimulation. Observations are discussed in light of current literature on this subject. Apparent relationships between ictal physiology and subsequent behavioral and psychological manifestations are considered. (27 ref.)—*Journal abstract.*

8409. **Tanfani, Leonardo & Carletti, Gianfranco.** **Osservazioni sul trattamento di soggetti caratteropatologici in una comunità di Emmaus funzionante da focolaio post-cura.** [Observations on the treatment of subjects with character disorders in a community of Emmaus

functioning as a post-cure center.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 405-417.—Describes a work community instituted in Italy in 1962 for the destitute where they could recover and utilize scrap material, e.g., iron and paper. In 1963 individuals from a psychiatric hospital were also included; they received room, board, clothing, and a small weekly sum. There are 3 basic rules in the free community: you must earn your food through working; your past life does not count; and the common goal is to aid anyone in need. Any member may leave the community whenever he wishes. 23 20-65 yr. old patients with character disorders were studied. All had serious personality problems, e.g., lack of a sense of reality, hyper and hypoevaluation of his ego, a lack of ethical sense, affective indifference, and many behavior problems resulting from alcoholism. Although at the beginning the program lacked an efficient administration and a qualified nurse to administer drugs, both are now present. 10 Ss did progress favorably toward their eventual reintegration in society. Many, however, had personality problems which were not conducive to self-discipline.—*A. M. Farfaglia.*

8410. **Wickram, Ian.** (Peoria Mental Health Clinic, Ill.) **Goals and some methods in psychotherapy: Hypnosis and isolation.** *American Journal of Clinical Hypnosis*, 1970(Oct), Vol. 13(2), 95-100.—Hypnosis and isolation may be effective procedures for manipulating the emotions of "hope" and "anxiety" which are probably the emotions most relevant to the process of changing human behavior.—*M. V. Kline.*

Drug Therapy

8411. **Bobon, D. P., Devroye, A., Goffioul, Lucienne, & Pinchard, A.** (U. Liège, Psychiatric Clinic, Belgium) **Le pimozide: Seize mois de follow-up.** [Pimozide: Sixteen months follow-up.] *Acta Neurologica et Psychiatrica Belgica*, 1968(Dec), Vol. 68(12), 888-894.—36 of the 55 patients included in the pilot study of pimozide were followed up, as outpatients, for 16 mo. It is concluded that pimozide ranked among the most clinically useful incisive neuroleptics. The dosage required was similar to that of haloperidol but its duration of action was at least 24 hr. after a single oral dose. Side effects and toxicity due to pimozide were unusually low. Pimozide is recommended for the long-term maintenance therapy of chronic delusional psychotics, especially those handicapped by the side effects of other neuroleptics. Relapse occurred in all 10 Ss who were not given pimozide. (Dutch & German summaries)—*English summary.*

8412. **Bolt, A. G. & Forrest, I. S.** (Veteran's Administration Hosp., Palo Alto, Calif.) **Metabolic studies of chlorpromazine induced hyperpigmentation of the skin in psychiatric patients.** *Aggressologie*, 1968(Mar), Vol. 9(2), 201-207.—Explored the nature of the interaction between the reactive compounds melanin and chlorpromazine. In vitro it was shown that chlorpromazine or 7-hydroxychlorpromazine interact with human melanoprotein in the presence of light. This was demonstrated by ultraviolet spectroscopy, electron paramagnetic resonance spectrometry, and conductimetric titration. In vivo studies involved the urinary excretion of chlorpromazine metabolites in patients with and without hyperpigmentation of the skin. Ss with this side effect excreted unconjugated 7-hydroxychlorpromazine derivatives at a higher rate. The distribution of chlorpromazine and its metabolites in the autopsied

viscera of comparable groups of Ss deceased after chronic drug administration, showing that all Ss stored moderate amounts of chlorpromazine and 7-hydroxychlorpromazine, as well as the demethylated derivatives of these compounds in the viscera. However, the O-glucuronides, derived from 7-hydroxychlorpromazine and its demethylated derivatives were present in trace amounts only in lung and liver. A biochemical mechanism for hyperpigmentation of the skin is postulated for this rare side effect of chronic chlorpromazine therapy. (27 ref.)—*Journal abstract.*

8413. Brown, William T. (U. British Columbia, Vancouver, Canada) **A comparative study of three hypnotics: Methypylon, glutethimide, and chloral hydrate.** *Canadian Medical Association Journal*, 1970(Mar), Vol. 102(5), 510-511.—Carried out a controlled study to evaluate the hypnotic potentiality of methypylon (300 mg.), glutethimide (500 mg.), and chloral hydrate (1000 mg.) on 50 inpatients experiencing long-standing insomnia. Ss ranged from 21-60 yr. old, the sexes were equally represented, and the clinical diagnoses were psychoneurosis, reactive depression, or anxiety reaction. The experimental design allowed for the exclusion of placebo reactors before the initiation of the main trials. No difference in effectiveness of maintaining sleep could be established among the 3 hypnotic agents, indicating that at the usual levels of statistical significance, all 3 agents were equally effective as hypnotics. However, a significant trend ($p = .05$) was found for methypylon to be the most effective and chloral hydrate to be the least effective of the 3 drugs in maintaining sleep. Methypylon was found statistically ($p = .05$) to be the fastest sleep-inducing agent, whereas glutethimide proved to be the slowest of the 3 hypnotics with respect to sleep induction time. French summary.—*Journal abstract.*

8414. Brugmans, J. (Janssen Pharmaceutica, Beerse, Belgium) **A multicentric clinical evaluation of pimozide: Preliminary report.** *Acta Neurologica et Psychiatrica Belgica*, 1968(Dec), Vol. 68(12), 875-887.—Reports results of the Belgian contribution to an international double-blind study on the efficacy and side effects liability of a neuroleptic, pimozide. A single dose of pimozide had potent and incisive antipsychotic properties, notably against autism, delusions, hallucinations, and social maladjustment. Extrapyramidal effects, hypnosedation, and autonomic effects were negligible or absent at therapeutic dosages. Pimozide is not indicated for patients requiring chemical restraint, but is likely to be the drug of choice for the maintenance therapy of existing or potential outpatients, particularly those for whom mental alertness and manual dexterity are important. (French, Dutch, & German summaries)—*Journal summary.*

8415. Campinho Pereira, J. L. & Cantalice Lipke, P. R. (Central Army Hosp., Neurological Clinic, Rio de Janeiro, Brazil) **Tratamento dos estados depressivos da involução: Emprêgo da monochloroimpramina.** [Treatment of involutive depressive states: Introduction of monochloroimpramine.] *O Hospital*, 1969(Aug), Vol. 76(2), 719-724.—Studied 26 47-65 yr. old female depressives who had not responded to previous medications and whose depression seemed to have been brought on by menopause. Ss showed no serious cardiovascular alterations. Ss received monochloroimpramine in 25-mg tablets. The most effective dosage was 75 mg/day, and did not exceed 150 mg/day.

Results show total remission of symptoms in 21 Ss and excellent drug tolerance. It is concluded that monochloroimpramine is a highly effective antidepressant with outstanding ansiolytic properties. (English summary)—P. Hertzberg.

8416. Cancro, Robert & Wilder, Russell. (U. Connecticut) **A mechanism of sudden death in chlorpromazine therapy.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 368-371.—Presents a case report that offers some insight into why sudden deaths in psychotic patients taking phenothiazines occur. It is felt that the combination of vasodilatation with the hypotensive effects of phenothiazines might explain some of the unexpected deaths. (16 ref.)—*Journal abstract.*

8417. Collard, J. (U. Liège, Belgium) **Le nitrazepam, un ansiolytique dérivé du chlordiazepoxide (librium), et sa place dans le spectre des psychorelaxants diazépiniques.** [Nitrazepam, an ansiolytic derived from chlordiazepoxide (librium), and its place in the spectre of psychorelaxants diazépiniques.] *Acta Neurologica et Psychiatrica Belgica*, 1969(Dec), Vol. 69(12), 1038-1047.—Studied nitrazepam (mogadon), a diazepam derived from chlordiazepoxide (librium), generally used as a sleep inductor, in diurnal treatments, as an antagonist of psychic tension and neurotic anxiety. From this viewpoint, only diazepam (valium) was qualitatively superior and nitrazepam determined less asthenia. Nitrazepam can serve as a substitute when diazepam is intolerated or becomes less active. The place of nitrazepam in the spectrum of psychorelaxing drugs (minor tranquilizers) of the diazepam series is defined, according to 2 opposite poles (sedation and anxiolysis) and to its main related compounds: Ro 4-9253, chlordiazepoxide, oxazepam, and diazepam. (17 ref.)—*Author summary.*

8418. Cronheim, Georg E. (Riker Lab., Northridge, Calif.) **Theoretical and practical approach to drug research analysis.** *Military Medicine*, 1970(Nov), Vol. 135(11), 1021-1027.—Many of the drugs currently being used today have come on the market within the last 30 yr. These drugs may be classified into 2 types: those with a previously unknown activity, and those with a previously known activity but for which a new activity has been found. Drugs with a new activity pose a particular problem in determining their effects and side effects with present governmental restrictions on the use of such drugs. 1 of the problems is that tests for the side effects of new drugs often produce a high number of false positives. A 2nd problem is that legislated standards of acceptance are slow to change and often new methods of evaluation must be made extant to evaluate new drugs.—G. A. Clum.

8419. Dehing, J. **Studies on the psychotropic action of Tegretol.** *Acta Neurologica et Psychiatrica Belgica*, 1968(Dec), Vol. 68(12), 895-905.—Evaluates the psychotropic action of tegretol (carbamazepine) in 58 psychiatric inpatients of whom only 7 were known to have epilepsy. Results indicate that tegretol has a proper psychotropic action which manifested itself clearly in 22 of the 50 Ss who had taken the drug at least 1 mo. This action became evident usually within 2 wk. and essentially improved character defects, e.g., aggressiveness, outbursts of rage, and disturbing behavior. The best results are obtained in the most severely affected patients and in those suffering from epilepsy or psychopathic personality. Tegretol has less effect in schizophrenics and little or no effect in patients with senile or arteriosclerotic

dementia and in idiots. Side effects, occurring mainly in elderly patients, can be avoided by using progressively increasing doses. (French & German summaries) (21 ref.)—*Journal summary*.

8420. DeJong, Russell N. (U. Michigan, Medical School) **Neurologic complications of drugs with primary action on nervous system.** *New York State Journal of Medicine*, 1970(Jul), Vol. 70(14), 1857-1965.—Examines the therapeutic implications and the dangers and side effects of: hypnotics and sedatives, major and minor tranquilizers, antidepressants and cerebral stimulants, and anticonvulsants. Discussion stresses neurologic manifestations and is limited to those drugs which are best known and most widely used or advertised. (56 ref.)—*M. Maney*.

8421. DeSilverio, Robert V., et al. (Philadelphia General Hosp., Pa.) **Perphenazine-amitriptyline in neurotic depressed outpatients: A controlled collaborative study.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 322-329.—Compared the combination of perphenazine-amitriptyline to each of its constituents in a double-blind study conducted with 138 depressed and anxious-depressed neurotic outpatients. Irrespective of drug, general practice patients improved the most, clinic patients somewhat less, and private psychiatric patients the least. Drug differences were limited to a few significant and borderline significant effects present only at 2 wk. and indicated that perphenazine produced the greatest improvement at this period.—*Journal abstract*.

8422. DiMascio, Alberto & Demigian, Edward. (Boston State Hosp., Mass.) **Antiparkinson drug overuse.** *Psychosomatics*, 1970(Nov), Vol. 11(6), 596-601.—Presents evidence from various studies indicating that antiparkinson drugs are being overused. 2 commonly held practices were considered and found unwarranted: the prophylactic prescription of antiparkinson drugs, and their extended prescription for the term of pharmacotherapy. It is suggested that antiparkinson drugs should be prescribed only after extrapyramidal side effects occur, usually for a period not to exceed 3 mo.—*Journal summary*.

8423. Eade, N. R. & Renton, K. W. (McGill U., Montreal, Quebec, Canada) **Effect of monoamine oxidase inhibitors on the N-demethylation and hydrolysis of meperidine.** *Biochemical Pharmacology*, 1970(Jul), Vol. 19(7), 2243-2250.—The administration of meperidine to patients being treated with a MAO inhibitor (I) can produce lethal reactions of unknown etiology. Inhibition of microsomal degradation of meperidine has been suggested as the explanation of these reactions. The kinetics of the inhibition of N-demethylation and hydrolysis of meperidine by 6 MAOI and β -diethylaminoethyl diethylpropylacetate hydrochloride (SKF-525A) are described. The hydrazine MAOI, phenelzine and iproniazid, d- and l-amphetamine, and SKF-525A, were competitive inhibitors of meperidine N-demethylation, while pargyline and tranlycypromine were noncompetitive inhibitors. The hydrolysis of meperidine was inhibited only by pargyline and the inhibition was competitive. The possibility that inhibition of both N-demethylation and hydrolysis of meperidine may be involved in the etiology of the adverse reactions which occur between the MAOI and meperidine is discussed. (33 ref.)—*Journal abstract*.

8424. Fabiani, F., Martini, P., & Franceschi-Biagiotti, F. (Arezzo Hosp., Italy) **Osservazioni cliniche e**

psicometriche sull'effetto terapeutico di un'associazione GABA-1-glutamina-aspartati-piridossalfosfato in un gruppo di spiconevrosicli neurastenici. [Clinical and psychometric observations in neurathenic psychoneurosis after treatment by an association GABA-1-glutamin-aspartates-pyridoxal-phosphate.] *Rivista di Neurobiologia*, 1969(Jan), Vol. 15(1), 35-62.—Reports clinical and psychometric results observed in a group of psychoneurotic-neurathenic Ss treated by an association GABA-1-glutamin-aspartates-pyridoxal-phosphate. Normalization of the anxiety index is underlined. (17 ref.)—*English summary*.

8425. Fielding, J. M., Mowbray, R. M., & Davies, Brian. (U. Melbourne, Victoria, Australia) **A preliminary controlled study of doxepin ("sinequan") as an antianxiety drug.** *Medical Journal of Australia*, 1969(Oct), Vol. 2(17), 851-852.—A factorially designed trial of doxepin showed it superior to placebo in relieving anxiety symptoms in 6-day hospital Ss, age 22-40 yr. old. A similar trial using 6 matched Ss showed that both doxepin and diazepam relieved anxiety symptoms. Ratings for anxiety were made from each S's main presenting symptoms and MA Scale scores. The value of controlled early clinical trials of new antianxiety agents and placebos is emphasized.—*Journal abstract*.

8426. Gadecki, W. & Majewski, J. (State Hosp. for Nervous & Mental Diseases, Locborow-Starigard, Poland) **New observations on atropine coma treatment in psychoses.** *Polish Medical Journal*, 1969, Vol. 8(6), 1515-1517.—Discusses the use of atropine coma therapy. Since it was observed that Ss' sensitivity to the drug usually decreases after several treatments, high doses (600-2000 mg.) were used in 12 cases. Normalization of pulse, blood pressure, respiration, and body temperature indicated that high doses were better tolerated than low doses. Good results were obtained with high atropine doses in 5 cases of endogenous depression and in 1 case of persistent prurigo suffering from a catatonic syndrome, where the S's cutaneous condition was markedly improved. It is concluded that the atropine coma technique might be improved by: (a) decreasing the number of comas to 10, (b) extending the duration of comas to 10-12 hr., and (c) considerably increasing the dosages as soon as the 1st signs of lowered sensitivity to the drug are apparent.—*Journal abstract*.

8427. Guy, William, et al. (George Washington U., Biometric Lab.) **A data processing system for psychotropic drug evaluation.** *Archives of General Psychiatry*, 1970(Nov), Vol. 23(5), 454-463.—Describes the Biometric Laboratory Information Processing System (BLIPS), developed to display and analyze data generated from psychotropic drug trials. To increase comparability across trials, the system employs a standard assessment battery and produces standard—but comprehensive—data output. The selection of drugs, populations, and research procedures, however, are wholly determined by the individual investigator. A minimum of constraints are imposed upon the users by the system, permitting wide latitude in the choice of research designs. Nonstandard assessment data can also be processed. Data analyses provided for a given study are nonjudgmental and the final appraisal of results resides with the investigator. The services of BLIPS are available free to individual investigators conducting clinical psychotropic drug trials. (29 ref.)—*Journal summary*.

8428. Hesbacher, Peter T., et al. (U. Pennsylvania)

Setting, patient, and doctor effects on drug response in neurotic patients: I. Differential attrition, dosage deviation, and side reaction responses to treatment. *Psychopharmacologia*, 1970, Vol. 18(2), 180-208.—Diazepam was compared to placebo and phenobarbital sodium in a double-blind study with 472 anxious psychoneurotic patients. Patients were treated in a medical clinic, general practice, or private psychiatric practice. The treatment setting was as important as the medication in producing a treatment response. Compared to phenobarbital patients, diazepam patients more often completed the study, followed prescribed dosage, and reported fewer side reactions. Diazepam patients did not differ from placebo patients in dosage intake or side effects, only in higher completion rate. Clinic patients dropped out and deviated from dosage more than private patients. General practice patients reported the most and private psychiatric patients reported the least side effects. (42 ref.)—*Journal abstract*.

8429. Hesbacher, Peter T., et al. (U. Pennsylvania) **Setting, patient, and doctor effects on drug response in neurotic patients: II. Differential improvement.** *Psychopharmacologia*, 1970, Vol. 18(2), 209-226.—Compared to placebo, both diazepam and phenobarbital produced more clinical improvement in a study with 472 anxious psychoneurotic patients. In general practice the 2 active drugs were equally effective. In private psychiatric practice the choice treatment was diazepam; in the medical clinic, phenobarbital. The differences depended upon patient behavior patterns, social class, and a medical (rather than a psychiatric) orientation to treatment. Diazepam was regarded as the treatment of choice for middle social class populations, and general practice and private psychiatric practice; phenobarbital represented the treatment of choice for low social class medical clinic patients.—*Journal abstract*.

8430. Kühne, G. E., Grünes, J. U., & Pelliccioni, R. (Martin Luther U., Clinic & Polyclinic of Psychiatry & Neurology, Halle-Wittenberg, E. Germany) **Zur Differentialtypologie psychopathologischer Basissyndrome.** [On the differential typology of psychopathologic basis syndromes.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(Aug), Vol. 22(8), 281-289.—Diagnosis of psychopathological states is reportedly improved by closer differentiation between simple "basic tendencies" and their combined forms designated as basic syndromes. Effects of butaperazine therapy is evaluated in relation to resolution of pathological basic syndromes involving affect and activity. (22 ref.)—*K. J. Hartman*.

8431. Lapolla, Anthony & Jones, Harry. (Camarillo State Hosp., Calif.) **Placebo-control evaluation of desipramine in depression.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 335-338.—Conducted a double-blind clinical trial to compare the effectiveness of desipramine and placebo in newly hospitalized patients. Analysis of data from 74 Ss (34 on desipramine, 40 on placebo) showed that in Ss with endogenous depression, the response to desipramine was superior to response to placebo as early as the 5th day of treatment; in Ss with neurotic (reactive) depression, no significant differences in response were found.—*Journal abstract*.

8432. Lipman, Ronald S., et al. (National Inst. of Mental Health, Chevy Chase, Md.) **Validation of the MacAndrew-Rosen Drug Therapy Scale.** *Diseases of the Nervous System*, 1970(Oct), Vol. 31(10), 680-683.—Presents data from 3 sources to support the validity of

the MacAndrew-Rosen Drug Therapy Scale in a study involving 12 psychiatrists and 267 patients. Results indicate that: (a) psychiatrists selected from the community as drug enthusiastic scored reliably higher on the scale than psychiatrists selected as nondrug enthusiastic, and (b) both patients' and observing psychiatrists' ratings of doctor drug enthusiasm, after the initial patient visit, were reliably correlated with the treating doctors' MacAndrew-Rosen Drug Therapy scores.—*Journal summary*.

8433. Madalena, J. Caruso; Pasin, Alfredo J., & Bern, Jann. **Estudo duplo-cego com a doxepina na ansiedade neurótica.** [A double blind study with doxepin on neurotic anxiety.] *O Hospital*, 1969(Aug), Vol. 76(2), 651-657.—Studied 30 Ss (in 3 groups of 10 each) with neurotic anxiety with and without somatization for 30 days. Group A received placebo; Group B, diazepam; and Group C, doxepin. Dosages were fixed and varied only according to individual side effects. Doxepin in 25-mg tablets and diazepam in 5-mg tablets were administered 3-6 times/day. Results, based on Hamilton's Anxiety Rating Scale, showed that in symptomatic remission, marked, and slight improvement, doxepin was slightly more effective than diazepam and was better tolerated. Drowsiness was observed in all Group C Ss, but was accompanied by excitation and anticholinergic effects in Group B Ss. (English summary) (19 ref.)—*P. Hertzberg*.

8434. McCabe, Michael S., Reich, Theodore, & Winokur, George. (Washington U., Medical School) **Methysergide as a treatment for mania.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 354-356.—Treated 12 patients with acute mania with doses of methysergide that had been reported to be effective. Only 1 S recovered; all the others required further therapy. Possible reasons for the failure of methysergide to terminate the manic episode are discussed.—*Journal abstract*.

8435. Morales Belda, F. J. & Hardo de la Cruz, Thomas. (Alcohete Psychiatric Hosp., Guadalajara, Spain) **Evaluación clínica de la acción del tiotixeno (P-4657 B) en el tratamiento de la psicosis alcohólica.** [Clinical evaluation of the action of thiothixene (P-4657 B) in the treatment of alcoholic psychosis.] *Actas Luso-Españolas de Neurología Psiquiatría*, 1968(Sep), Vol. 27(4), 537-543.—Tested the effects of thiothixene, a new neuroleptic, on 15 36-67 yr. old males with alcoholic psychosis. 8 Ss completed a 6-mo treatment period and 1 remained under treatment for 9 mo. The other Ss did not complete the treatment program. Effective dosage varied between 30-60 mg/day. In 1 S, almost complete remission was obtained with 15 mg/day. In general, thiothixene had a beneficial effect on alcoholic psychosis, ranging from light to marked improvement in 10 Ss. Its effect on the symptoms was summarized, noting significant action on autism, disinterest in work, hyperactivity, and disorientation. In 2 Ss, side effects of hypersalivation and parkinsonism were observed. However, excellent gastrointestinal tolerance and the absence of hepatic, renal, and hematologic toxicity were noted. (English & French summaries)—*P. Hertzberg*.

8436. Murphy, Dennis L., Colburn, Robert W., Davis, John M., & Bunney, William E. (National Inst. of Health, Bethesda, Md.) **Imipramine and lithium effects on biogenic amine transport in depressed and manic-depressed patients.** *American Journal of Psychiatry*,

1970(Sep), Vol. 127(3), 339-345.—Used platelets obtained from 15 patients before and during treatment with imipramine and lithium to determine whether the effects of these drugs suggested by animal studies to be involved in cell membrane transport could be identified in these human cells. Imipramine was found to inhibit and lithium to stimulate amine transport in platelets, confirming that the cellular effects of these drugs in man are similar to their effects on brain cells from animals. (34 ref.)—*Journal abstract.*

8437. **Orlandi, Orlando V. & Vaisman, Jayme.** (U. Game Filho, Medical School, Rio de Janeiro, Brazil) **Experiência com nova forma de Mandrix nas perturbações do sono da criança.** [Experiment with a new form of Mandrix in sleep perturbations of the child.] *O Hospital*, 1969(Dec), Vol. 76(6), 2011-2017.—Discusses the use of a new form of mandrix composed of 62.5 mg. metaqualone and 6.25 mg. chlorhydrate of difenidramine in 1 tablet. 7 girls and 3 boys, 6-14 yr. old, with sleep disturbances, were administered placebo for 7-10 days and then mandrix for 10 days. Comparisons show that time of sleep onset averaged 31.7 min. with placebo, and 11.8 min. with mandrix. Mandrix was also effective in inducing a tranquil sleep and did not disturb the Ss' awakening. Excellent tolerance was noted. Dosage was geared to each Ss' weight and varied between $\frac{1}{2}$ and 1 tablet/day.—*P. Hertzberg.*

8438. **Platman, Stanley R.** (South Beach Psychiatric Center, Brooklyn, N.Y.) **A comparison of lithium carbonate and chlorpromazine in mania.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 351-353.—Treated 13 manic patients with lithium carbonate and 10 manic patients with chlorpromazine in a double-blind, randomly selected drug trial. Lithium carbonate proved superior to chlorpromazine on all 6 parameters selected from an objective rating scale. The problems militating against a valid research trial utilizing these medications in this type of patient are discussed.—*Journal abstract.*

8439. **Scardino, Joseph.** (St. Vincent's Hosp., New York, N.Y.) **Lithium in affective disorders.** *New York State Journal of Medicine*, 1970(Mar), Vol. 70(5), 638-642.—Reviews the literature and discusses the lithium ion historically, psychopharmacologically, and physiologically. The clinical application, advantages and disadvantages, and the contraindications are examined. (21 ref.)

8440. **Sprague, Robert L., Barnes, Kenneth R., & Werry, John S.** (U. Illinois, Children's Research Center) **Methylphenidate and thioridazine: Learning, reaction time, activity, and classroom behavior in disturbed children.** *American Journal of Orthopsychiatry*, 1970(Jul), Vol. 40(4), 615-628.—Studied 12 emotionally disturbed underachieving boys in a special education class who served as their own controls in a 3-factor study: drug (methylphenidate, thioridazine, and placebo), dosage (low and high), and number of stimuli displayed. Methylphenidate significantly increased correct responding, decreased RTs and hyperactivity, and significantly increased attention and cooperative behavior in the classroom. (44 ref.)—*Journal abstract.*

8441. **Talbott, John A.** (St. Luke's Hosp. Center, New York, N.Y.) **Phenothiazine toxicity in pool shark.** *New York State Journal of Medicine*, 1970(Jun), Vol. 70(12), 1671-1672.—Presents a case report of a 60-yr-old patient "whose life was focused around his skill at billiards and who became depressed when this skill was compromised

by the neurologic side-effects of phenothiazine medication. The resolution of the depression depended... on the adjustment of medication and treatment of the side-effects, [and] on the re-establishment of his ego-enhancing skill." It is emphasized that "psychopharmacologic agents can cause symptoms resembling neurologic or psychiatric illnesses in psychiatric or nonpsychiatric patients, that interference of highly valued skills or talents in borderline patients can result in acute emotional disturbances, and that consideration should always be given to restoring a person's normal life balance to resolve this crisis."—*M. Maney.*

8442. **Teichmann, H. & Knaape, H. H.** (U. Rostock, Neuroclinic for Neuropsychiatric Children, E. Germany) **Die Leistungen antriebsgeminderter, leicht ermüdbarer Normalschulkinder unter Aponeuron im Arbeitsversuch.** [The performances of easily tiring normal schoolchildren with reduced drive under aponeuron in a trial.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(Aug), Vol. 22(8), 298-304.—Administration of 50 mg. daily of aponeuron failed to produce statistically significant improvement over untreated students in a 60-min Pauli test of arithmetic. Subjective feelings of less fatigue after the test favored the drug rather than a placebo.—*K. J. Hartman.*

8443. **Van der Velde, Christiaan D.** (Norwich Hosp., Abraham Ribicoff Research Center, Conn.) **Effectiveness of lithium carbonate in the treatment of manic-depressive illness.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 345-351.—Reports on the responses to lithium carbonate of 75 manic-depressive patients. Lithium carbonate was found to be highly effective in the acute manic state but without merit in the treatment of acute depression. Its efficacy was inversely related to age. Response to the drug varied in some Ss; a positive response at 1 time was no guarantee for a similar response in subsequent trials. The possibility of different biochemical states underlying similar clinical states is discussed.—*Journal abstract.*

8444. **Vega, C. Morales; Pérez, A. Concepción, & Puente, J. Lequerica.** (San Francisco, Javier Psychiatric Hosp., Pamplona, Spain) **El metronidazol como tratamiento de aversión en el alcoholismo crónico.** [Metronidazole as a treatment of aversion in chronic alcoholism.] *Archivos de Neurobiología*, 1970(Apr), Vol. 33(2), 171-183.—Administered metronidazole to 30 chronic alcoholics in dosages of 750 mg. (divided 3 times throughout the day) for a minimum of 2 mo. and 500 mg/day after a 3-mo period. Ss chosen for this experiment were volunteers desiring cure and were capable of self-criticism. It was believed they would continue their medication after initial treatment. The follow-up period varied from 2-14 mo. The leucocyte count of Ss was taken prior to treatment and once every 20 days (by using the leucocyte formula) for the purpose of testing asymptomatic and temporary leucopenias and/or neutropenias. 28 cases had had from 1-6 previous admissions to the hospital, 1 had 12, and 1 had none. It is concluded that metronidazole is an "effective drug devoid of unpleasant secondary effects and produces a psychophysical aversion to alcoholism." This treatment was successful on 29 Ss, and failed with 1. (French & English summaries)—*S. Maze.*

8445. **Young, Edwin.** (Wolston Park Hosp., Wacol, Queensland, Australia) **Hospital experience with fluphenazine enanthate.** *Diseases of the Nervous System*, 1970(Oct), Vol. 31(10), 705-709.—Describes the use

of fluphenazine enanthate (25 mgm., with repeat injections at 14-day intervals) in the treatment of 43 chronic schizophrenic and 60 mentally retarded patients. Results indicate that 51% of chronic schizophrenics and 22% of mentally retarded Ss showed improvement in behavior above their previous treatment level. Approximately 30% of all Ss experienced extrapyramidal reactions which were readily controlled by benzhexol and did not appear to be related to age or dosage. Side effects from previous phenothiazine treatment (weight gain, skin changes) disappeared. Advantages of the drug in convenience of administration, saving of time, and overall economy are noted. (15 ref.)—*Journal summary*.

8446. Yvonneau, M. (Vauclaire Psychiatric Hosp., France) **Le carbonate de lithium en thérapeutique psychiatrique.** [Lithium carbonate in psychiatric therapeutics.] *Evolution Psychiatrique*, 1970(Apr), Vol. 35(2), 407-429.—The relative failure of contemporary expensive chemotherapies to prevent relapses of manic-depressive psychosis, and the revived interest in various countries in lithium salts for this indication, led to trials with lithium carbonate for over a yr. In an experience with 26 cases of psychotic excitation, 13 manic-depressive patients improved in a proportion of 70% of manic dominance, and 66% depressive. 4 Ss in 14 appeared to have escaped relapses. Transitory complications (asthenia, vomiting, etc.) were generally controlled. A careful selection of candidates for lithium treatment is mandatory: collapsus (1 fatal case in a patient with cachectic Huntington's disease) and coma were observed in the visceraally damaged (heart, kidneys, brain) as well as in the aged. Procreation was advised against during the treatment period. A general review of treatment and practical indications on procedures are offered. It is concluded that lithium salts is a beneficial, though nonemergency, drug which is basic in periodic psychoses, should be duly supervised, and is inexpensive to administer. (43 ref.)—*English summary*.

HOSPITAL CARE & INSTITUTIONALIZATION

8447. Azoubel Neto, David & Azoubel, Lenise L. **Desenvolvimento espontâneo de um jornal de pacientes et su influência na formação de um ambiente terapêutico em um hospital diurno.** [A spontaneous development of a patients' newspaper and its influence to establish a therapeutic environment in a psychiatric day hospital.] *Acta Psiquiátrica y Psicología de América Latina*, 1970(Jun), Vol. 16(2), 142-147.—Describes the spontaneous appearance and development of a patients' newspaper in a psychiatric day hospital in Brazil. The function of the publication is emphasized as a means of communicating feelings and criticisms of the patients about the medical personnel and about themselves. The encouragement and support of the continuity and progress of patients' newspapers is suggested.—*English summary*.

8448. Bonn, Ethel M. (Ft. Logan Mental Health Center, Denver, Colo.) **A therapeutic community in an open state hospital: Administrative-therapeutic links.** *Hospital & Community Psychiatry*, 1969(Sep), Vol. 20(9), 269-278.—States that social learning and teaching provide the core and essence of social therapy as the means of helping patients progress at Fort Logan Mental Health Center. Emphasis is on as much freedom for patients and staff as they can handle. The main value of the therapeutic community is that it provides frequent

opportunities for staff and patients to learn from each other. Each treatment team, comprised of staff and patients, uses a variety of person-to-person modalities designed to meet the needs of the patients. Decision making and treatment planning are based on the contributions of the entire team. Problems are, of course, unavoidable, i.e., self-deception of an entire team regarding its accomplishments. If a team's subjective estimates of its worth are not reflected by objective measures of its performance, it eventually will become dependent on having "enemies" to account for its inadequacies. The administration is likely to become the "enemy."—*M. Walker*.

8449. Davenport, Harold T. & Werry, John S. (U. British Columbia, Vancouver, Canada) **The effect of general anesthesia, surgery and hospitalization upon the behavior of children.** *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 806-824.—Compared the behavior of 145 United States and Canadian 1-15 yr. olds undergoing tonsillectomy to that of sibs or normal controls. Behavioral data was obtained by a questionnaire administered to mothers of Ss before surgery and 2 wk. later. Contrary to the findings of several recent studies, no significant evidence of post-hospitalization upset was found, nor were differences discovered between the Canadian and the United States groups. (16 ref.)—*Journal abstract*.

8450. Dershowitz, Alan M. (Harvard U., Law School) **The psychiatrist's power in civil commitment: A knife that cuts both ways.** *Psychology Today*, 1969(Feb), Vol. 2(9), 43-47.—Civil commitment has been placed nearly exclusively in the hands of psychiatrists. This abdication of responsibility by the courts has occurred without public debate and in spite of the inconsistency and inaccuracy of opinions concerning commitment. To relieve the present injustices the law should become more precise concerning socially unacceptable acts. Instead of asking the vague question of whether the person is likely to be dangerous to himself and/or others, the courts could then ask what the person might do and how likely it is that he would do it. Commitment would then be handled as the legal decision it is.—*E. J. Posavac*.

8451. Eggert, Delmer C. & Price, Josephine. (Mental Health Inst., Mt. Pleasant, Ia.) **Family-planning services in a mental hospital.** *Hospital & Community Psychiatry*, 1969(Sep), Vol. 20(9), 283-286.—Describes an institute which initiated a family-planning program in conjunction with the local planned parenthood center. No extra staff or money were involved. Patients attending the program included both men and women. There was impressive group therapy during question and answer periods. The program resulted in both emotional and physical benefits for the women. The chances of the additional stress of an unplanned pregnancy being added to the burden of emotional disturbance have been decreased and cancer detection procedures initiated. Soon a program was started for teen-age patients which has proven successful in helping this group to better understand and cope with sexual drives. This is of considerable significance considering that most mental hospitals have a high proportion of impulsive, often promiscuous youngsters—a very high-risk group for out-of-wedlock pregnancies. From the institute's experiences, it is concluded that family-planning services do belong in a mental hospital.—*M. Walker*.

8452. Fürstenau, P., Stephanos, S. F., & Zenz, H.

(Psychosomatic University Clinic, Giessen, W. Germany) **Erfahrungen mit einer Gruppentherapeutisch geführten Neurotikerstation.** [Experiences with a group therapeutically managed neurotic ward.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1970(May), Vol. 20(3), 95-104.—Reports group therapy experiences in a neurotic patient ward. The basic psychoanalytic concepts of the patient and his treatment are discussed. The functions and approaches of the ward staff (physician, nursing personnel, structural therapist), the group psychotherapist, and the research psychologist are outlined. Special emphasis is placed on utilizing the psychotherapeutic capabilities of the nurses and on collective decisions by the ward staff in regard to accepting patients. Findings on the activities of the staff in the ward conference, results of a test investigation at the beginning and end of stationary treatment, and hypotheses on the clinical course during treatment are also presented.—*English summary.*

8453. Hansen, Steven V. (Milwaukee Psychiatric Hosp., Adolescent Day Care Program, Wauwatosa, Wis.) **Impact of adolescent patients on a psychiatric hospital.** *Hospital & Community Psychiatry*, 1969(Nov), Vol. 20(11), 331-334.—Many adolescents in a psychiatric hospital exhibit destructive tendencies, e.g., physical property, mores, and traditions, which cause difficulties in maintaining an optimal therapeutic milieu for them and the adult patients. Among the problems related to adolescent patients are (a) the need to closely monitor their number in relationship to the number of adult patients; (b) the impact on the nursing staff, i.e., too much permissiveness vs. extreme control and authoritarianism; (c) the drug problem; and (d) the tendency of adolescents to run away. Nevertheless, the process of dealing with the special problems of adolescents often improves the entire hospital milieu. It is recommended that in the treatment of adolescents the relationship of the patient to staff workers be emphasized, with the therapist using each new relationship to effect intrapsychic changes. Because of the peer group's great importance in adolescent culture, group therapy is especially effective. And since most adolescents will return to their families, family therapy is another by-product of the adolescent program.—*M. Walker.*

8454. Kleban, Morton H., Lipton, Mortimer B., & Lawton, Mortimer P. (Norristown State Hosp., Pa.) **Staff communications on the admission service of a state mental institution.** *Pennsylvania Psychiatric Quarterly*, 1970(Spr), Vol. 10(1), 41-48.—Attempts to clarify the nature of staff communication so that objective feedback could be provided to the medical and treatment staffs about the nature of their communications. Each of 93 employees rated his level of communication with every other employee in the admission service. The communication system is shown to be hierarchical in structure. The "diagnostic" or "professional" cluster (dominated by supervisory psychiatrists) remains relatively remote from the "patient care cluster" (directed essentially by the nursing staff), suggesting a separation based on professional class. It is concluded that while a hierarchy is necessary for efficient management of an admission service, the gap between the 2 clusters actually is a bar to efficiency if information cannot cross the gap.—*M. Walker.*

8455. Malmquist, Carl P. (U. Minnesota, Inst. of Child Development) **The delinquent and the insane: Right and adequacy of treatment.** *American Journal of*

Orthopsychiatry, 1970(Apr), Vol. 40(3), 388-396.—Recent court decisions have opened the question of whether the rights of offenders are being transgressed when they are involuntarily committed to mental institutions. The question is part of the fundamental moral issue of how to balance society's right to protection against the individual's right to freedom. The mental health professions are directly involved in the issue through the question of adequacy of treatment. It is suggested that 1 of the necessary tasks of the behavioral sciences is to clarify for courts, agencies, and the lay public what feasible criteria for treatment may be, as well as the limitations present in current therapeutic techniques, so that the judiciary may be helped to make judgments that properly balance public safety and individual rights.—*Journal abstract.*

8456. Martin, Morgan. (Norwich Hosp., Conn.) **Unitizing a public mental hospital.** *Hospital & Community Psychiatry*, 1969(Sep), Vol. 20(9), 287-289.

8457. Mudd, Samuel; Loeb, Armin; Lasky, David, & Laucks, S. Philip. (Harrisburg State Hosp., Pa.) **A systems study of the rehabilitation process at Harrisburg State Hospital.** *Pennsylvania Psychiatric Quarterly*, 1970(Spr), Vol. 10(1), 5-26.—Deals with the committee reports and recommendations by administrative representatives, clinical department heads, non-supervisory personnel, and patient representatives selected by their peers, concerning rehabilitation planning at a state hospital. By October, 1970 the proposed rehabilitation system should approach a level of development that provides for the identification and specification of patient needs in terms of rehabilitation program profile (RPP) categories. These needs directly establish the system program requirements that set staff training requirements. The total system is coherent in that patient needs, as spelled out by the RPP, specify program and staff development requirements and also articulate through these same behavioral terms with community resources. The system will have built-in evaluation processes which will allow for the overall administration of the system with reference to the budgetary criteria and for system adaptation to new demands imposed on the system by the community, the department of welfare, or other systems.—*Journal abstract.*

8458. Muzekari, Louis H. (Philadelphia State Hosp., Male Rehabilitation Unit, Pa.) **The induction process: A method of choice in intrainstitutional transfer.** *Journal of Nervous & Mental Disease*, 1970(Jun), Vol. 150(6), 419-422.—Examined the effects of a non-traditional (gradual) vs. a traditional (abrupt) intrainstitutional transfer procedure. It was hypothesized that a gradual transition procedure would be useful in allaying the stress and regression noted in patients who were changed from primarily custodial to treatment-oriented wards, and facilitate early involvement in treatment. An induction group experience consisted of 16 biweekly sessions which each gradually inducted S was required to attend. These sessions were begun prior to S's actual transfer to the unit and continued after his transfer to the rehabilitation unit. Contrary to expectation, the number of Ss who became acutely disturbed within 3 mo. following transfer, and were subsequently returned to their former wards, was comparable for both gradual and abruptly transferred Ss. Therefore, instances of transfer trauma are to be expected regardless of the transfer procedure. However, comparisons between the 2 groups on measures of social

behavior support the utility of the gradual induction process as being instrumental in counteracting the interpersonal isolation of the chronic psychotic by facilitating group participation and promoting increased awareness of unit residents and staff.—*Journal abstract.*

8459. Roncal, Rogelio B. (Middletown State Hosp., N.Y.) **Chronically ill, self-sustaining patients in a state mental hospital.** *New York State Journal of Medicine*, 1970(Sep), Vol. 70(18), 2328-2331.—Presents clinical observations and conclusions drawn after 1 yr. of a state hospital program which separated the chronically ill, self-sustaining patients into a separate unit. 4 approaches to the treatment of these patients are discussed: (a) adjustment of dependency needs, (b) assistance in acquiring a new philosophy of life, (c) help in eradicating the fear of uselessness and loneliness, and (d) encouragement in recognizing and maintaining a goal in life. Psychotherapy, occupational or avocational activity, group therapy, and drugs or physical methods are suggested as useful techniques in achieving motivation and organization within the framework of a personal relationship. The valuable contribution that can be made by the ward attendant in the rehabilitation of these patients is noted.—*Journal summary.*

8460. Schiff, Samuel B. (Ft. Logan Mental Health Center, Denver, Colo.) **A therapeutic community in an open state hospital: Administrative framework for social psychiatry.** *Hospital & Community Psychiatry*, 1969(Sep), Vol. 20(9), 259-268.—Describes a center founded in 1962 as a pioneering and unorthodox institution which was and is a model for state institutions. The center's opening was characterized by excitement, innovativeness, and high commitment by the staff. However, staff problems arose concerning the use of power, delegation and retrieval of authority, and the difficulties of defining areas of responsibility. Management at the center has sought to implement the treatment program without imposing undue restraints. However, one's view of the amount of constraint may depend on his position in the hierarchy of the institution. Problems for management arose in dealing with the public and elected officials over hospital procedures and funding. It is felt that 1 of the major deficits in the institution's 8-yr history was the lack of well-organized, effective long-range management and current evaluation planning processes after initiation of the treatment programs. The staff and administrators still consider the program to be experimental, but it is considered to be highly successful.—*M. Walker.*

8461. Segal, Bernard E. (Dartmouth Coll.) **Hierarchy and work dissatisfaction in a Chilean hospital.** *Social Forces*, 1969(Dec), Vol. 48(2), 193-202.—Interviewed professional and nonprofessional staff members who had daily contact with in-patients at a major hospital. Members of both groups who reported that physicians were hard to approach were less satisfied with their work, in particular feeling that they were less able to exert much control over it. Professionals feeling less able to control their work reported more frequent thoughts of quitting, and of their work being unrewarding. Such associations occurred among nonprofessionals as well, but in addition they seemed more troubled by having to put up with errors that other subordinates had committed. Findings are considered in the light of whether respondents had traditionalistic or modernistic orientations. (22 ref.)—*Journal abstract.*

8462. Sorosky, Arthur D., Rieger, Norbert L., &

Tanguay, Peter E. (Camarillo State Hosp., Children's Treatment Center, Calif.) **Furnishing a psychiatric unit for children.** *Hospital & Community Psychiatry*, 1969(Nov), Vol. 20(11), 334-336.

8463. Stern, Roy. (Temple U. Hosp.) **Standard operating procedures and institutionalization on the psychiatric unit.** *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 744-750.—Discusses 4 specific areas—suicide precautions, isolation, privileges and drug addiction—in which institutional psychiatric units apply standard operating procedures. It is suggested that such standard procedures limit operational flexibility, and create an environment in which the staff is prone to treat "behavior" rather than treating people. Energies usually applied toward standard operating procedures could better be directed toward better communication systems and development of affective and relational aspects in the unit.—*Journal abstract.*

8464. Wing, J. K. & Brown, G. W. (U. London, England) **Institutionalism and schizophrenia: A comparative study of three mental hospitals: 1960-1968.** Cambridge, England: Cambridge U. Press, 1970. xiii, 260 p. \$12.50.

PSYCHOANALYTIC INTERPRETATION

8465. Bennet, E. A. (London U., Inst. of Psychiatry, England) **What Jung really said.** New York, N.Y.: Schocken, 1970. 186 p. \$1.95(paper).

8466. Blum, Harold P. **Maternal psychopathology and nocturnal enuresis.** *Psychoanalytic Quarterly*, 1970(Oct), Vol. 39(4), 609-619.—Psychological determinants of nocturnal enuresis are many and diverse. This paper focuses on maternal influences. Analysis of a mother of 3 enuretic daughters revealed unconscious conflicts over her own intense desires to wet. These conflicts were multidetermined and involved ambivalent childhood relationships with several figures, including her enuretic sister, her stillborn twin brother, and her father and grandfather. She played out her conflicts by having her daughters wet for her. Thus, she could enjoy wetting without awareness or apparent responsibility. With the help of her husband she was able to organize a urinary household in which her daughters were stimulated and rewarded for their enuresis. The mother's fostering of her children's enuresis began during their prephallic toilet training and continued beyond the urethral phase into later childhood.—*Journal summary.*

8467. Chouinard, Timothy. (Forest Park Coll.) **The symbol and the archetype in analytical psychology and literary criticism.** *Journal of Analytical Psychology*, 1970(Jul), Vol. 15(2), 155-164.—Common principles of interpretation and the coherent vocabulary among literary critics seems to be lacking. An archetype is defined as a symbol which is significantly pervasive in traditional literature. Symbols are either descending or ascending. A descending symbol is the literary unit of expression used by a writer who would not think of any image he used as symbolic. An ascending symbol is one which is individually and consciously formed as an allomorphic content of an ambiguous archetypal form. Therefore, all archetypes are symbolic but not all symbols are archetypal.—*P. Federman.*

8468. Fordham, Michael. (1 St. Katharine's Precinct, Regent's Park, London, England) **Reply to Plaut's "Comment."** *Journal of Analytical Psychology*, 1970(Jul), Vol. 15(2), 177-181.—Replies to a comment by A. Plaut

on "not incarnating the archetype." The term archetype was omitted from M. Fordham's previous article because technique was considered a manifestation of ego functioning. Issue is taken with Plaut's comments that "there is a place for the analyst to incarnate an archetypal image" and that an analyst would "be wiser to reject."—P. Federman.

8474. Hinojosa, Armando. **La tragedia de Edipo.** [The Oedipus tragedy.] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1968, No. 10, 32-43.—Argues that Freud, in his analysis of the Oedipus tragedy, extracted only those elements which suited his theory of castration, and presents an analysis which takes the drama as a whole in order to demonstrate the presence of a more universal theme. This analysis views Oedipus, not as representative of a particular man, but as an example of a universal situation pertinent to the human condition which all men suffer, the vacillation and doubt of the desire to leave parents and return to them. Thus, Oedipus typifies the image of what man is from birth to maturity, the latter of which is reached through painful suffering and a struggle that is pursued not against others, but against one's own inner emotions and obstacles. Self-respect is thus attained, guilt is eliminated, and human weakness is accepted along with human strength.—S. Maze.

8475. Kadinsky, David. **The meaning of technique.** *Journal of Analytical Psychology*, 1970(Jul), Vol. 15(2), 165-176.—Examines the meaning of technique in analytical psychology. Technique is a representation of a certain aspect of personality, the part that is mechanical, habitual, based on fact. This aspect of personality cannot be grasped by intellectual concepts. Thus, the appearance of the symbol.—P. Federman.

8476. Lowenfeld, Henry & Lowenfeld, Yela. **Our permissive society and the superego: Some current thoughts about Freud's cultural concepts.** *Psychoanalytic Quarterly*, 1970(Oct), Vol. 39(4), 590-608.—"Freud's ideas about the development of civilization and its dilemma between freedom and restriction of drives... have been remarkably confirmed by the events and the change of the cultural climate of the last 50 yr. Sexual freedom has, in accordance with Freud's conception of repression, considerably transformed the manifestations of the neuroses; however, it has not produced greater mental health but only new neurotic constellations. The lesser repression of infantile sexuality has, as he feared, reduced the control of aggression... The task of 'reconciling men to civilization' is not made easier through the liberation of drives. In a period

of cultural stability, the infantile, irrational demands of the superego which conflicted with the mature superego could be worked out in the analytic process. The protecting and controlling function of the superego could be left to the influence of the surrounding society. The present cultural chaos confronts psychoanalysis with entirely new tasks..."—J. Z. Elias.

8477. Lupton, Mary J. (Morgan State Coll.) **The dark dream of "dejection."** *Literature & Psychology*, 1968, Vol. 18(1), 39-47.—Applies psychological concepts to an earlier version of S. T. Coleridge's "Dejection: An Ode," entitled "Verse Letter" to reconstruct the latent thoughts behind the final version. Childhood experiences and personal events leading up to the "intense psychic experience" objectified in the poem are analyzed in terms of an unsolved Oedipal conflict and regression to the fantasy of oral gratification. (20 ref.)—M. Maney.

8478. Maccoby, Michael. **Una interpretación psicoanalítica de los votos de castidad, pobreza y obediencia.** [A psychoanalytic interpretation of the vows of chastity, poverty, and obedience.] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1968, No. 10, 22-31.—Within the context of humanistic psychoanalysis and, in particular, Fromm's theory that man's character is shaped by the relationship between corresponding regressive (pathologic) and progressive (healthful) psychic forces, it is proposed that: (a) the vow of poverty is tied to an attitude toward things and refers to the polarity between love of life and destructiveness, (b) the vow of chastity is related to an attitude toward people and refers to the polarity between love and narcissism, and (c) the vow of obedience is related to an attitude toward the law and power and refers to the polarity between liberty and symbiosis. Implications of this interpretation for character structure and intrapsychic conflict are discussed. It is concluded that psychoanalysis could provide a more refined and reliable means of aiding those who have responsibility over the younger members of the religious community to recognize the signs of regression and pathology and to realistically evaluate how the taking of vows will affect the mental health of the individual involved.—M. Maney.

8480. Meissner, W. W. (Massachusetts Mental Health Center, Boston) **Notes on identification: I. Origins in Freud.** *Psychoanalytic Quarterly*, 1970(Oct), Vol. 39(4), 563-589.—Discusses the origins and formulations of the concept as provided by Freud. The following types are delineated: "1) Dream identification: a form of condensation in dreaming by which the S's ego represents itself as other figures in the dream's manifest content. 2) Hysterical identification: the assimilation of a property or symptom of an object by the S as an expression of a resemblance derived from a common element which remains unconscious... 3) Primary identification: the original and primitive form of emotional attachment to an object prior to any object which regressively replaces the abandoned object relation by introjection of the object. Oral incorporation is again appealed to as a model but in a different sense, as dictated by the precedence of an object cathexis... 5) Partial (secondary) identification: a form of identification based on the perception of a common quality which does not

depend on an object relation. The mechanism does not involve introjection and pertains to the development of structure within the ego. It is an important mechanism in character formation and in group formation . . ."—J. Z. Elias.

8484. Smith, Edward W. (Georgia State U.) **The fascinating toothpick: A study in phallic symbolism.** *International Journal of Symbolism*, 1970(Apr), Vol. 1(3), 21-25.—Throughout history man has engaged in the symbolic handling of the phallus, usually with flourish and rituals. The nearly universal occurrence of this phenomenon, in juxtaposition with the universal taboos respective of the phallus bespeaks the awe, the wonder, the fascination, even the fear which men feels when confronted by this unique organ. It appears that man required an attenuated contact with the phallus, through a symbol, whereby he gains a degree of control while maintaining a safe distance from the real phallus. This can be seen as a case of perpetual partial desensitization. A blatant version of such a ritual is provided by the hunter of the raccoon who takes as his trophy, to be used as a toothpick, the bone from the penis of his prey, in the patois, the "cooncock."—*Journal abstract*.

PSYCHODIAGNOSIS

8487. ———. **Variation in psychiatric diagnosis.** *British Medical Journal*, 1968(Dec), Vol. 4(5631), 595.—Reviews various attempts to provide a diagnosis and classification system which will allow valid inter-O comparisons. A monograph by M. Shepherd, J. Cooper, E. Brooke, and T. Lin (see PA, Vol. 43:9845) on variation in psychiatric diagnosis is discussed. Their analysis of case histories and videotaped psychiatric interviews revealed 3 types of O disagreement derived from: (a) clinical observation and perception, (b) inferences drawn from observation, and (c) nomenclature and nosological systems. It is suggested that computers might be of value in the investigation of the diagnostic process.—G. Steele.

8488. Berger, Josip; Marinkov, Milica; Stojanović, Ljubinka, & Aleksić, Zdenka. **Hipoteza o slojevima kao teorijski okvir predikacije uspeha rehabilitacije neurotičara.** [The levels hypothesis as a theoretical framework for the prediction of outcome in the treatment of psychoneurotics.] *Psihologija*, 1969(Sep), Vol. 2(2), 421-431.—Attempted to predict the outcome of treatment of a group of psychoneurotics, assessed by 3 different kinds of indicators representing 3 levels of personality. The Index of Social Competence (ISC), the

WAIS, and a personality assessment from Rorschach protocols, were hypothesized to represent different levels of personality on the overt (surface) to the covert (deep) dimension. 73 psychoneurotics were tested at the beginning of a treatment and rehabilitation program. After 2 yr. of treatment each S was assessed on his successful return to job, family, and social practices. Results confirm the hypotheses. The indicators operationally defined as surface (ISC) and in-between (WAIS) had significant predictive validity, while the assessment of the Rorschach protocols did not. It was found that the validity of the Rorschach personality assessment was in accord with the length of clinical experience. It is concluded that the levels hypothesis represents a stimulating and adequate frame of reference for further validation studies of clinical psychodiagnostic batteries. It is assumed that a more sophisticated multimethod-multicriterion design arranged according to the levels hypothesis could be even more fruitful.—*English summary*.

8489. Člen, Jozef. (Comenius U., Bratislava, Czechoslovakia) **Deduktívna a indukívna metóda v psychodiagnostike.** [Deductive and inductive method in psychodiagnostics.] *Psychologica: Sborník Filozofickej Fakulty, U. Komenského, Bratislava*, 1967, Vol. 18(7), 61-81.—Discussed the importance in diagnostic work of evaluating the role played by symptoms in the whole system of personality. Present classification and nomenclature of mental disorders were considered insufficient for accurate diagnosis. Application of some time-saving tests, i.e., the tapping test as an indicator of brain lesions, was suggested and thoroughness in diagnostic procedure was emphasized. (Russian & German summaries)—*English summary*.

8490. Dey, P. K., Chatterjee, B. K., Rakshit, P., & Majumdar, A. **Electroencephalographic characteristics in abnormal brain functions.** *Bulletin of the Council of Social & Psychological Research, Calcutta*, 1967, No. 8, 5-12.—Analyzed EEGs of schizophrenics, mental deficient, delinquents, psychopaths, and mongols (Total N=19) with eyes open and closed, with sound stimulation, and with hyperventilation. 2 types of physiological defects were revealed: maturational defects and cleavage in the cortical-subcortical feedback system. It is concluded that these defects are responsible for the impairment of normal learning processes and give rise to behavior disorder.—*Journal abstract*.

8491. Espenak, Liljan. (New York U., Medical School) **Movement Diagnosis Tests and the inherent laws governing their use in treatment: An aid in detecting the lifestyle.** *Individual Psychologist*, 1970(May), Vol. 7(1), 8-13.—Describes the Movement Diagnosis Tests and discusses their value in the application of psychomotor therapy.—A. R. Howard.

8492. Fernández M., Octavio. **La importancia de una teoría psicopatológica para entender la nosología psiquiátrica en la adolescencia.** [Importance of a psychopathological theory to understand the psychiatric nosology in adolescence.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969, Vol. 15(3), 233-238.—Criteria are proposed for the development of a psychiatric nosology for adolescents on the basis of a logical approach of intersection—as opposed to an approach of inclusion. A still incomplete theory is proposed, correlating age, sex, and pathology, that can be used as a basis for a nosology specific for adolescents.—*English summary*.

8494. Frijling-Schreuder, E. C. Borderline states in children. *Psychoanalytic Study of the Child*, 1969, Vol. 24, 307-327.
8495. Ginsberg, Aniela. (Pontifícia U. Católica, São Paulo, Brazil) *Tentativa de Validação externa de Métodos para o estudo da personalidade*. [Experiment of external validation of methods for personality study.] *Revista de Psicologia Normale Patológica*, 1969(Jan), Vol. 15(1-2), 3-93.—Attempted to validate personality assessment methods by experimentally induced changes in Ss' behavior. Excitation and inhibition were studied in 2 student groups of 84 females and 40 males, using the Rorschach, Benn-Rorschach, and Myokinetic Psychodiagnostic (MKP) technique of Mira and Lopez. Anxiety was studied in 80 male and 85 female students, 18-28 yr. old, using the Holtzman Inkblot Test (Forms A and B) and 2 intelligence tests. Rigidity was studied in 20 adult priests, 25 13-14 yr. old boys, and 10 epileptics, using 2 intelligence tests, the Berg Test, Luchins Water Jug Test, the Rorschach, and the MKP. The Rorschach yielded the highest level of significance for indices of excitability and anxiety. It also separated anxious neurotics from controls and excited depressive maniacal psychotics from normals. The mean secondary deviations in the MKP were significantly different for anxious neurotics and normal controls. The utility of the rigidity index was proved with the epileptics. Some validity indications for anxiety and excitation were found in the Behn-Rorschach and in the Inkblot Test. (English & French summaries) (24 ref.).—P. Hertzberg.
8496. Gordon, Adrien V. & Gregson, R. A. (U. Canterbury, New Zealand) *The Symptom-Sign Inventory as a diagnostic differentia for paranoid and non-paranoid schizophrenics*. *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 347-356.—Suggests a transformation for certain Symptom-Sign Inventory items which will produce a brief, powerful, discriminating tool for differentiating between paranoid and nonparanoid schizophrenics and normals. A factor analysis of the data of a reference group of 9 male and 9 female paranoid and 9 male and 9 female nonparanoid schizophrenics produced factors which apparently bear a closer relationship to previously reported psychotic factors than to G. A. Foulds' theoretical set-intersection model of functional psychosis. (26 ref.).—*Journal abstract*.
8497. Harman, Charles E. & Raymond, Christopher S. (Pacific Medical Center, Inst. of Neurological Sciences, San Francisco, Calif.) *Computer prediction of chronic psychiatric patients*. *Journal of Nervous & Mental Disease*, 1970(Jun), Vol. 150(6), 490-503.—Evaluates a computer clustering procedure for predicting the outcome of psychiatric patients. Premorbid and performance evaluations of 356 Ss were obtained during hospitalization. Active treatment led to a relatively high discharge rate. The clustering procedures led to successful predictions of outcome adjustment levels which differed significantly for 3 schizophrenic groups. Performance clusters correlated higher than premorbid adjustment with outcome adjustment. (26 ref.).—*Journal abstract*.
8498. Hayward, A. E. (Glenside Hosp., Bristol, England) *The 16-PF and a general psychiatric factor*. *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 382-383.—Examined the scores obtained among a psychiatric population on the following 2nd-order factors of the 16 PF: neuroticism, anxiety, introversion-extroversion, tough poise, and independence. Ss were 84 patients whose disorders "covered most of the psychiatric spectrum" but excluded those with organic etiology or a verbal IQ below 90. Results confirm the impression of high interrelatedness among the 2nd-order factors and indicate that information obtained by the 16 PF relates to features common to all psychiatric patients. It is concluded that the test "cannot be used directly to discriminate between patients in terms of their personality characteristics."—P. McMillan.
8499. Hertz, D. (Hadassah U. Hosp., Jerusalem, Israel) [The problem of the borderline psychiatric diagnosis.] *Harefuah*, 1970(Sep), Vol. 79(6), 258-260.—The diagnosis of "borderline case" has not been officially recognized in the psychiatric nomenclature. The definition has been used in those cases in which no manifest psychotic symptoms were found. Clinicians use the diagnosis of "borderline" when confronted with difficulty in defining with certainty the existence of psychosis or neurosis, when the clinical findings suggest tendencies toward both entities. This difficulty explains the multiple diagnoses used to define this condition, such as "ambulatory schizophrenia," "hidden psychosis," or "pseudoneurotic schizophrenia." Presented is a survey of the different diagnostic attitudes in the literature, critically comparing the behavioristic approach with the psychodynamic orientation.—*English abstract*.

8501. Kielmanowicz, Raquel. *El grupo diagnóstico de niños en un servicio hospitalario*. [Children's diagnostic group in a hospital service.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Mar), Vol. 16(1), 53-56.—Describes the simultaneous, but separate, conduction of diagnostic groups of children and their parents. Children's groups make use of play material and interpretation aimed to each child's insight into his problem; parents' groups are based on interpretation aimed to obtain the parent's insight on his child's abnormal behavior. The following points of the diagnostic group are discussed: fundamental objectives, general working framework, characteristics of the group, diagnostic, and interpretation.—V. A. Colotta.
8502. Kurtz, Richard M., Weech, Alexander A., & Dizenhuz, Israel M. (Washington U.) *Decision-making as to type of treatment in a child psychiatry clinic*. *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 795-805.—Studied what factors influence diagnosticians' judgments when making recommendations. 28 families seeking treatment were rated on numerous variables, which were then factor analyzed. 2 clusters of variables emerged, a social factor and an ego factor. The social factor variables deal with the S's recognition that he has an emotional problem and his capacity to seek professional help; they are inversely correlated with social class. Ego factor variables are generally intrapsychic but also deal with issues of human rapport. Social factor variables were the most reliable in predicting whether an S would receive long- or short-term treatment.—*Journal abstract*.
8503. Lipke, Paulo R. *Prognóstico das psicopatias*.

[Prognostic of psychopaths.] *O Hospital*, 1969(Aug), Vol. 76(2), 561-565.—Discusses the importance of considering social, economic, and cultural bases for psychopathology. It is proposed that man's social character is conditioned by his socioeconomic climate. Man's capacity for causing social change to best suit his needs is considered basic to the family situation which is society's principal agent. Since man's social existence is thought to determine his perception of reality, it is proposed that future diagnoses of mental illness should be made through examining the patient's social structure.—P. Hertzberg.

8504. McQuitty, Louis L., Banks, Richard G., & Frary, Jewel M. (U. Miami) **Submatrices of interassociations for scoring interrelatedness within matrices as an index of psychological disturbance.** *Multivariate Behavioral Research*, 1970(Oct), Vol. 5(4), 479-488.—Describes a method whereby a matrix of interassociations between individuals can be divided to yield a submatrix which can in turn be used to score the degree of interrelatedness of the parent matrix. The method can be applied to determine the significance of the difference between the interrelatedness of 2 or more parent matrices. The method is applied to a small study of 8 normal and 8 disturbed subjects.—*Journal abstract*.

8505. Meikle, Stewart & Gerritse, Richard. (Foothills Hosp., Calgary, Alberta, Canada) **A comparison of psychiatric symptom frequency under narrative and check list conditions.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 379-382.—Investigated the effect of the frequency with which descriptive items are used when a check list is substituted for the usual narrative history. Results suggest that rather than resulting in a loss of descriptive information the check list produced a sizable increase in the use of such terms.—*Journal abstract*.

8506. Peverill, Jack A. (U. Minnesota) **A scale for identification of learning disability using the Personality Inventory for Children.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1548.

8507. Phillips, J. P. (U. Hull, England) **A further type of personal questionnaire technique.** *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 338-346.—Describes a questionnaire for an individual psychiatric patient to scale changes in the severity of his symptoms similar to the method of M. B. Shapiro. For each symptom statements are devised representing graded levels of severity, and an ordinal scaling of the statements is obtained from the patient. When a scaling of the current level of the symptom is required, the questionnaire is administered by presenting each of the statements to the patient in turn, and asking him whether he feels better or worse than indicated by it. After every administration the responses, which may be either consistent or inconsistent, are scored. Consistent responses constitute an ordinal scaling of the current severity of the symptom; inconsistent ones (the possibility of which affords a check on reliability) are scored by a method similar to that of P. Slater for dealing with pair comparison preference judgments. Other procedures for dealing with inconsistent responding are described, and a scheme for computer scoring briefly reported. An illustrative case study is included. (18 ref.)—*Journal abstract*.

8508. Placido, Sagù. **Valutazione mediante il test di Rosenzweig dell'indicazione psicoterapeutica in un caso di caratteriale cicloide.** [Evaluation by means of

the Rosenzweig test for psychotherapeutic indication in a case of cycloid character disorder.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 367-369.—Studied a case of cycloid character disturbance to show the prognostic evaluation that can be accomplished through a psychological examination. Psychotherapeutic treatment was encouraged from the favorable indications after the Rosenzweig Picture-Frustration Study. Certain facts of the test foretold the results, e.g., the positive value of the "need-persistence" responses and the study of tendencies of the personality subjected to the prolongation of the frustrating situation. The psychodiagnostic examination provided useful facts about personality structure.—A. M. Farfaglia.

8509. Reynolds, A. G. & Pylyshyn, Z. W. (Dartmouth Coll.) **Stylostatistics of various psychiatric groups.** *Language & Speech*, 1970(Jul), Vol. 13(3), 194-198.—Used 30 nonsyntactic stylostistical measures of language performance in an attempt to differentiate 53 psychiatric patients. The 30 variables were analyzed by 1-way analysis of variance and covariance, with the WAIS IQ as the covariate. Only 5 of these measures showed discriminatory ability; schizophrenics reliably displayed longer words and more variability in word length, and neurotics showed a paucity of usage vocabulary size.—*Journal abstract*.

8510. Thoresen, Paul W. (Marquette U.) **The use of self description in identifying and predicting students who seek help with their emotional problems.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1552.

8511. Voigt, Walter H. (Ohio U.) **Assessment of organic brain impairment in a psychiatric population.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1553.

8512. Wagner, Edwin E. & Hoover, Thomas O. (U. Akron) **Intra-protocol plate failures: An investigation of Rorschach card meaning.** *Journal of Projective Techniques & Personality Assessment*, 1970(Dec), Vol. 34(6), 484-486.—33 Ss designated as neurotic, character disorders, and schizophrenic or preschizophrenic, were found who had IQs of average or better, but who exhibited exactly 2 failures on the Rorschach. Analysis of the pairs of card rejections revealed a disproportionate number of Card IX failures and a clustering among Plates IV, VI, VII, and IX. (20 ref.)—*Journal abstract*.

8513. Yen, Yi-shiu. (National Taiwan U., Taipei) **On the modified BRS.** *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 101-111.—Describes a modification of the "basic Rorschach score" (BRS) of C. Bühler, K. Bühler, and D. W. Lefever, for use in Taiwan. Ss were 100 schizophrenics (Group S), 50 neurotics (Group P), and 50 normals (Group N). The modified BRS was established by computing the X_i differences between the S-N, S-P, and P-N groups. The weight and positive and negative values of the items were determined by the level of significance of statistical results with reference to the diagnostic consequence of each item, the BRS of Bühler, the modified BRS of Y. Kataguchi, and clinical experience.—*Journal abstract*.

BEHAVIOR DISORDER

8514. Berk, Richard A. & Adams, Joseph M. (Johns Hopkins U.) **Establishing rapport with deviant groups.** *Social Problems*, 1970(Sum), Vol. 18(1), 102-117.—Under the best conditions, participant observation

poses problems in which complex human and methodological considerations are inextricably entwined. Among the most problematic of these considerations are the necessary processes by which the investigator establishes and maintains rapport with his Ss. If there exists a large gap in social background between the investigator and his Ss and if the Ss are unusually hostile and suspicious, gaining ongoing rapport often becomes an especially formidable task. This paper draws on the field experiences of the authors as long-term participant-observers of juvenile delinquents and drug addicts, in order to present useful suggestions for handling some of the problems that typically arise in the attempts to establish rapport with distrustful groups that also differ considerably in life style, presumably, from the typical social scientist.—S. L. Warren.

8515. Esler, Harold. **Agresividad, depresión y enajenación.** [Aggressiveness, depression and alienation.] *Revista de Psicoanálisis, Psiquiatria y Psicología*, 1968, No. 10, 14-21.—Examined 100 adolescents institutionalized under maximum security because of extremely aggressive behavior and acting out, and discusses unconscious depression as the underlying cause for such behavior. Ss vacillated between deep unconscious depression causing conscious intolerable pain, and insensitivity. Characteristics included fear and inability to make friends, narcissism and its constant pampering, identity problems and their symptoms, anguish of being castrated, longing for the security of the womb, feelings of emptiness, and paranoia of being hurt. Compensating mechanisms were expressed by a great appetite for food and cigarettes, the use of drugs, driving at high speed, and growing long hair and beards. Group therapy proved more effective than individual therapy, and the hours at which the sessions were held were significant. It is emphasized that progress made during treatment must be maintained in a social environment outside the institution. Love, rigid control, interaction with other people, and the cultivation of a sense of security and confidence in the therapist are suggested as remedies for depression, alienation, and aggressiveness.—S. Maze.

8516. Flynn, William R. (U. California, Medical School, Los Angeles) **Frontier justice: A contribution to the theory of child battery.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 375-379.—Asserts that child abuse is often dependent upon structural and dynamic elements within the adult. 2 cases are reported of mothers who beat 1 of their children. It is concluded that defective defense structures of the ego are frequently responsible for child abuse, and that abusing parents tend to project their anger onto their children, while denying and repressing it in themselves.—*Journal abstract*.

8517. Lovibond, S. H. (U. New South Wales, Kensington, South Australia) **Pure and applied psychology: Towards a significant interaction.** *Australian Psychologist*, 1970(Jul), Vol. 5(2), 120-140.—Outlines advantages of the development of close links between clinical and experimental psychology, citing the works of J. Dollard, N. Miller, J. Masserman, J. Wolpe, and B. Skinner as approaches to development of the experimental foundations of clinical psychology. Operant procedures provide only a very limited base for clinical practice. 2 major considerations in the selection of a theoretical system to serve as the starting point for the experimental analysis of behavior disorders are (a) the system should permit appropriate weight to be given to

central integrating processes; and (b) it should permit advances in many areas of general experimental psychology to be utilized in dealing with the problems of disturbed behavior, criteria at present best met by general behavior theories which make use of neuropsychological concepts. The author's own work and that of his students in the field of behavior disorders is outlined to illustrate the possibilities of interaction between pure and applied psychology in aversion therapy, systematic desensitization, desensitization with relaxation, study of punishment or passive avoidance procedures, and the role of secondary reinforcement in punishment.—T. N. Webster.

8518. Ranzato, Francesco P. **Trattamento psicoterapico del caratteropatici con tendenze criminose.** [Psychotherapeutic treatment of character disorders with criminal tendencies.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 364-366.—The lack of a valid paternal figure, the formation of the personality in an atmosphere without affection or educational directives, and consequently the incomprehension of people, and unwholesome company are the causes in some patients of antisocial tendencies and criminal impulses. A case of a 24-yr-old male is studied. The most difficult problem is that the "bad father" image may be transferred to the psychotherapist, and he can even become the object of the crime. 1st this image of the "bad father" was constructed for the S and then destroyed in order to make the patient an integral man.—A. M. Farfaglia.

8519. Schmauk, Frank J. (Norristown State Hosp., Pa.) **Punishment, arousal, and avoidance learning in sociopaths.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 325-335.—Investigated the relationships among different kinds of punishment, autonomic arousal, subjective anxiety, and avoidance learning in primary sociopaths. 90 male Ss consisting of 30 primary sociopaths (PSs), 30 neurotic sociopaths (NSs), and 30 normal controls (NCs) were selected and assigned, on the basis of 10 from each group, to 1 of 3 punishment conditions: physical punishment (PP—shock), tangible punishment (TP—loss of money), or social punishment (SP—E saying "wrong"). Ss were run in an avoidance learning procedure, and measures of autonomic arousal and subjective anxiety were obtained concurrent with performance in the learning task. Under the PP and SP conditions, the PS group scored significantly below the NC group in anticipatory arousal, subjective anxiety, and avoidance learning. Under the TP condition, the PS group showed significant increases on these 3 measures and scored at approximately the same level as the NC group. (23 ref.)—*Journal abstract*.

8520. Sharma, U. D. **Aggression and dermatoglyphics.** *Bulletin of the Council of Social & Psychological Research, Calcutta*, 1968, No. 10-11, 12-15.—Investigated the relationship between dermatoglyphics, aggression in 9 Bengali-speaking 9-14 yr. olds from an institution for behavioral disorders. Each S was rated on a 5-point scale for inner and outer aggression. The dermatoglyphics were examined by measuring the epidermal thickness in terms of ridge-counts and the cushioning in terms of the tension on the water logged state of the cells. Results suggest that epidermal skin thickness bears little relationship with aggression, and that the cushioning has a negative relation with aggression toward the self.—*Journal abstract*.

8521. Sutker, Patricia B., Gil, Sandra H., & Sutker, Louis W. (Tulane U., Medical School) **Sociopathy and**

serial learning of CVC combinations with high and low social content ratings. *Journal of Personality & Social Psychology*, 1971(Feb), Vol. 17(2), 158-162.—Hypothesized that sociopaths, being socially more adroit and more responsive to affective and exciting stimuli, would demonstrate faster acquisition than nonsociopaths for CVCs rated high in terms of social content. A low and a high social CVC list were prepared, with scaled meaningfulness values held relatively constant for both. 12 sociopaths and 12 nonsociopaths practiced on each of the 2 lists. The Shipley Institute of Living Scale and the MMPI were administered prior to the learning task. Results indicate that sociopaths performed significantly better on the high social list than did nonsociopaths and significantly better on the high social list than on the low. Nonsociopaths demonstrated no significant difference in speed of acquisition for the 2 lists. Findings suggest that sociopaths are indeed responsive to social stimuli, and that such stimuli are intrinsically more rewarding than those of low social content.—*Journal abstract*.

Drug Addiction

8522. Bellizzi, John J. (St. John's U., Jamaica, N.Y.) **Legal prescription of narcotics.** *New York State Journal of Medicine*, 1970(Jun), Vol. 70(12), 1677-1680.—Reviews the provisions outlined in the New York State Public Health Law and Pamphlet 56 to clarify those conditions under which physicians may make narcotics available to both nonaddict and addict patients. The cooperation of all physicians, other practitioners, and pharmacists is urged in relation to the administration, prescribing, and dispensing of narcotic drugs.—*M. Maney*.

8523. Lombardi, Donald N. (Seton Hall U.) **The special language of the addict.** *Pastoral Psychology*, 1969(Jun), Vol. 20(195), 51-52.—1 ancillary technique which can be utilized in understanding the symptomatology, dynamics, and etiology of the addict is the vernacular used by him. Such words as high, loaded, turned on, junkie, stuff, crap, garbage, dope, fix, spike, bag, beat, burned, and busted point to the essential life style of the addict as dependent, lacking in social interest, and a person who finds the world a hostile and dangerous place.—*O. Strunk*.

Alcoholism

8524. Albuquerque Fortes, José R. **Psilocibina e alcoolismo crônico.** [Psilocybin and chronic alcoholism.] *Arquivos da Coordenadoria de Saúde Mental do Estado de São Paulo*, 1966(Jan), Vol. 32(1), 5-129.—Studied the effects of psilocybin on 30 adult male chronic alcoholics. The methodology is described and studies provided. The results of the experiment are followed by 11 conclusions. (106 ref.)—*R. H. Gillis*.

8525. Alonso Fernández, Francisco. (Medical School, Sevilla, Spain) **Alcoholismo y desarrollo en España.** [Alcoholism and development in Spain.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Jun), Vol. 16(2), 155-163.—Presents a survey of epidemiological research on alcoholism. It is noted that: (a) there has been a gradual increase in the percentage of alcoholics admitted in several psychiatric hospitals over the last 2-3 decades; (b) there seems to be an increase in

the number of alcoholics from S. to N. in Spain; and (c) more than 50% of youngsters under 20-yr-old consume alcoholic beverages. The cultural and dynamic aspects of alcoholism are discussed. (73 ref.)—*V. A. Colotta*.

8526. Andrade, Oswald M. **Tratamento moderno do alcoolismo e do "delirium tremens": Considerações médico-forenses.** [Modern treatment of alcoholism and of delirium tremens: Medical-forensic considerations.] *O Hospital*, 1968(Sep), Vol. 74(3), 729-749.—Discusses alcoholism from historical, sociological, psychological, and clinical viewpoints. Alcoholism is defined according to different types of drinkers and different phases of dependency. Progressive symptoms leading to delirium tremens are described, and treatment suggestions, based on the work of an alcohol emergency clinic, are made. Surveys of the population show that the incidence of alcoholism is great enough to pose a public health problem on an international basis. The relation between alcoholism and crime is considered regarding the Brazilian penal code. (30 ref.)—*P. Hertzberg*.

8527. Block, Marvin A. (State U. New York, Medical School, Buffalo) **Alcohol: Man and science.** *New York State Journal of Medicine*, 1970(Nov), Vol. 70(21), 2732-2740.—Examines the nature of alcohol as a drug, detailing its effects upon the metabolism and various internal organs. The positive and negative effects on the economy are also considered. Statistics are presented on the shortened life expectancy of alcoholics; automobile casualties; percentages of drinkers by age, religion, economic status, and education; and per capita consumption of liquor, wine, and beer. Alcoholism is discussed as an illness, and the need for revision of social attitudes toward the alcoholic is emphasized. Approaches to its prevention by early detection, and education as to the uses and abuses of alcohol are outlined.—*S. Knapp*.

8528. Finkel, David A. (U. Massachusetts) **Temporal gradient of reinforcement and temporal gradient of punishment differences between alcoholics and non-alcoholics.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1535.

8529. Reed, Archie. (Alcoholic Rehabilitation Center, Avon Park, Fla.) **Using a tape recorder in counseling alcoholics.** *Pastoral Psychology*, 1969(Dec), Vol. 20(199), 45-49.—The use of a tape recorder as a therapeutic and educational aid is both unlimited and exciting. Techniques and examples are presented.—*O. Strunk*.

Suicide

8530. ———. **Prevention of suicide.** *Public Health Papers*, 1968, No. 35, 84 p.

8531. Carrasco, Santo-Domingo; Carrasco Gómez, J. José, & Alonso, Adela. (Marqués de Mondéjar, Madrid, Spain) **La tentativa de suicidio: Estudio de un grupo de 94 tentativas de suicidio.** [Suicide attempts: A study of a group of 94 attempted suicides.] *Archivos de Neurobiología*, 1970(Apr), Vol. 33(2), 131-169.—Completes a previous article by the authors on psychiatric aspects of suicide attempts of 94 11-74 yr. olds admitted to a Spanish Social Security General Hospital. The analytical-descriptive method was used to interpret the results in percentage of the group sampled vs. those of the general population. "The demographic data showed 3 Maxima of frequency at 20, 40, and 60 yrs. of age with different distribution for sex and civil status." Suicide

attempts of young females and middle aged males seemed to differ. It is proposed that suicide attempts (a) are a culturally determined creation of today's sophisticated society which include a variety of factors, and (b) conditions the possibility of reversibility. Family and individual case histories were studied whereby alcoholism, drug dependence, and homosexuality predominated. Past and present motivations as well as the final results of the attempts are discussed, and it is argued "that suicide attempts are an often unavoidable end to an irreversible situation that is independent of the Ss own consciousness of personal motivations and purposes." The Rorschach test data, 3 childhood suicide attempts, and the various aspects of medical and psychiatric assistance are examined.—S. Maze.

8532. Denner, J. Lee. (U. Kansas, Medical Center, Kansas City) **Management of suicide attempt.** *New York State Journal of Medicine*, 1970(Jun), Vol. 70(12), 1666-1667.—Discusses the "difficult task" often left to the physician in ascertaining and clarifying the meaning of a suicide attempt for both the patient and important others in his life. It is stressed that each incidence of suicidal communication "must be carefully and individually appraised," and that the physician must not only see and call by name the undistorted reality, but "he must also set in motion those steps which will 1 day make that life-affirming reality... felt by the patient."—M. Maney.

8533. Hippler, Arthur E. (U. Alaska) **Fusion and frustration: Dimensions in the cross-cultural ethnopsychology of suicide.** *American Anthropologist*, 1969(Dec), Vol. 71(6), 1074-1087.—Reviews the literature and outlines directions in which a systematic and comprehensive theory of suicide can be developed which would explain the cross-cultural variation in forms and rates. Borrowing theoretical formulations from psychology, suicide is considered as (a) a desire for fusion—a return to a pleasant state with the mother, and (b) as aggression—intra- and extrapunitive behavior. The interrelationship of child rearing, social structure, and cultural values in a number of cultures is examined as determining the method and frequency of suicide. (65 ref.)—S. Knapp.

8534. Mende, W. (U. Tübingen, Neuro-clinic, W. Germany) **Rechtliche Konsequenzen des Suizides.** [The civil-legal consequences of suicidal acts.] *Psychiatria Clinica*, 1970, Vol. 3(2), 108-113.—The civil- and criminal-legal consequences of suicidal acts depend largely on their motivation. The motives themselves are in turn influenced by their legal and political consequences. Thus the motivations for the recently increased suicides and suicidal attempts of young people which often appear not very convincing, can be better understood if the sociopsychological background to these suicidal events are taken into consideration. That there exists such a mutually conditioning and characterizing relationship becomes apparent in the sacrificial suicides, e.g., self-burning. The motivations for such suicidal acts are only partly transparent.—English summary.

8535. Miller, Dorothy H. (Scientific Analysis Corp., San Francisco, Calif.) **Suicidal careers: Case analysis of suicidal mental patients.** *Social Work*, 1970(Jan), Vol. 15(1), 27-36.—Made a case analysis of 25 suicides to find common factors in their social-psychological perspectives. Evidence points to the development in these persons of a rigid heroic self-image unsupported by significant others. When seriously threatened by a crisis,

these persons are led to kill themselves rather than give up their private hero image.—Journal abstract.

8536. Sanborn, Donald E., Casey, Thomas M., & Niswander, G. Donald. (Arthur P. Noyes Inst. for Neuropsychiatric Research, Concord, N.H.) **Suicide: Seasonal patterns and related variables.** *Diseases of the Nervous System*, 1970(Oct), Vol. 31(10), 702-704.—Reports data on the seasonal incidence and patterns of suicide in New Hampshire from 1956-1968. Suicides were compared with the total number of other deaths, psychiatric admissions to a local hospital, and barometric pressure for each of the 4 seasons during the 13-yr period. Results are as follows: (a) suicides correlated positively with admissions but not with barometric pressure and other deaths; (b) admissions correlated positively with suicides and other deaths, and negatively (but with lower significance) with barometric pressure; and (c) other deaths were not significantly correlated with suicides and barometric pressure.—P. McMillan.

Crime

8537. Cloninger, C. Robert & Guze, Samuel B. (Washington U., Medical School) **Female criminals: Their personal, familial, and social backgrounds: The relation of these to the diagnoses of sociopathy and hysteria.** *Archives of General Psychiatry*, 1970(Dec), Vol. 23(6), 554-558.—Describes characteristics of convicted female felons in a study involving 34 whites, 30 Negroes, 1 American Indian, and 1 woman of mixed descent. Data indicate that Ss were characterized by marked parental deprivation, psychopathological disturbance, and other severe disturbances in all areas of life. Poor school performance, school delinquency, poor job records, running away from home, periods of wanderlust, frequent fights, sexual maladjustment, prostitution, repeated marital discord, and poor performances as mothers were frequent. It is concluded that female criminals with sociopathy and with hysteria apparently come from similar backgrounds and have similar life styles, except for the features that are part of the diagnostic criteria for the 2 disorders.—Journal abstract.

8538. Cloninger, C. Robert & Guze, Samuel B. (Washington U., Medical School) **Psychiatric illness and female criminality: The role of sociopathy and hysteria in the antisocial woman.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 303-311.—Performed a systematic psychiatric study with a group of 78 convicted women felons. All Ss received at least 1 psychiatric diagnosis. Sociopathy, alcoholism, drug dependency, hysteria, and homosexuality were encountered more frequently than would be expected in the general female population. Sociopathy or hysteria was found in 80%; a 20 times greater prevalence of hysteria than is found in the general population was the most striking finding. Results of this study confirm other work suggesting that there is a significant association between sociopathy and hysteria.—Journal abstract.

8539. Falek, Arthur; Craddick, Ray, & Collum, Julius. (Georgia Mental Health Inst., Div. of Human Genetics, Atlanta) **An attempt to identify prisoners with an XYY chromosome complement by psychiatric and psychological means.** *Journal of Nervous & Mental Disease*, 1970(Mar), Vol. 150(3), 165-170.—Evaluated 25 prisoners, 6 ft. in height and over, who had less than normal intelligence and were detained in maximum security

institutions for dangerous or violent acts, to identify those who seemed to fit the reported criteria of persons with an XYY chromosome karyotype. A psychiatric interview and the MMPI were used as measures. Chromosome analysis of these Ss revealed no such individual. However, cytogenetic study of a tall prisoner with severe acne persisting into adulthood indicated the presence of the XYY chromosome pattern. This S, however, did not fit the psychiatric or psychological criteria for those with an XYY chromosome anomaly. A complete case study is included. A method of determining the proper criteria to concentrate persons with XYY chromosome karyotype in a prison population is discussed.—*Journal abstract.*

8540. Fray, Pierre. (U. Toulouse, Medical School, France) **Crimes et délits par réactivité primitive.** [Crimes and offenses by primitive reactivity.] *Annales Médico-Psychologiques*, 1970(May), Vol. 1(5), 701-718.—Classifies crimes as acts arising from an interaction of the total person with his life circumstances, behaviors that are learned and habitual, or as paradoxical isolated reactions to events by an individual not otherwise given to criminal behavior. It is suggested that offenses of the latter kind may usefully be seen as short-circuit, primitive defensive reactions which resemble reflex behavior more than preplanned and organized behavior. The offenses of infanticide, arson, or sudden murder, and infant-kidnapping are often of this type. Case histories support the idea that explosive, nonelaborated and unpremeditated acts may be carried out by neurotic individuals as a primitive catastrophic reaction to a sudden crisis in their life situation.—*H. E. King.*

8541. Haesler, Walter T. (Saxerriet Prison, Psychological Service, Switzerland) **Offender therapy in a Swiss prison.** *International Journal of Offender Therapy*, 1968, Vol. 12(3), 127-132.—Describes Saxerriet near Zürich, an open prison for 120 selected 1st offenders, built in 1964. Since 1966 it has had a psychological service which offers group and individual therapy both to inmates and their wives, and closely cooperates with the prison staff. Case histories of 4 successfully treated criminals are related.—*Journal summary.*

8542. Halleck, Seymour L. (U. Wisconsin) **The psychiatrist and the legal process.** *Psychology Today*, 1969(Feb), Vol. 2(9), 25-28.—The psychiatrist's role in determining whether a defendant was responsible for his acts is based on a false understanding of his area of competence. Value judgments, not knowledge, determine the content of his testimony. The psychiatrist is also forced into an approach which conflicts with his treatment methods since patients are assumed to be responsible. Practical injustices exist too, e.g., it is not humane to send a defendant to a state mental hospital. It is suggested that a better approach would have the court decide whether the accused committed the act and the psychiatrist help "to diagnose, treat and rehabilitate all classes of offenders."—*E. J. Posavac.*

8543. Laplante, Jacques. (U. Laval, Quebec, Canada) **Les effets psychologiques de la détention.** [The psychological effects of imprisonment.] *Laval Médical*, 1969(Dec), Vol. 40(10), 1057-1061.—Surveys briefly experiments from literature on perceptual isolation and sensory deprivation, the pathological effects of hunger in humans, and the behavioral effects of affective deprivation in monkeys. A parallel is drawn between these phenomena and the deprivation of prisoners, which involves loss of freedom, lack of emotional relationships,

prohibition of possessions and services, and loss of heterosexual relationships with resultant homosexual practices. The prisoner's life is monotonously regulated down to its last detail. Cultural indigency and a feeling of being degraded, as well as early and late development of psychoses, are further products of imprisonment. Reform measures with a rehabilitative purpose are outlined. (19 ref.)—*T. N. Webster.*

8544. Marcus, Anthony M. (U. British Columbia, Div. of Forensic Psychiatry, Vancouver, Canada) **Encounters with the dangerous sexual offender.** *Canada's Mental Health*, 1970(Sep), Vol. 18(5), 9-14.—Presents an in-depth study of the dangerous sexual offender using a group approach. 10 prisoners participated. Data obtained from a full psychological test battery, social history, and biography revealed a profile of the dangerous sexual offender which emphasized "an extremely negative self-image." Videotape playback was used, allowing "the individuals far more clearly to see himself as others see him." 14 factors of dangerousness were confirmed. It is concluded that the group method effectively reveals accurate information for parole, evaluation, and treatment.—*G. Steele.*

8545. Money, John. **Use of an androgen-depleting hormone in the treatment of male sex offenders.** *Journal of Sex Research*, 1970(Aug), Vol. 6(3), 165-172.—Medroxyprogesterone acetate, an androgen-depleting hormone, offers some promise in the treatment of male sex-offender disorders. Its effect on the genital function is that the penis becomes unable to have an erection, semen is not produced, and orgasm does not occur. The antecedent to treatment is usually some type of life crisis arising from sexual behavior. A case illustration with a bisexual transvestite patient under long-term follow-up study is presented.—*E. B. Jaffa.*

8546. Schmideberg, Melitta. **Techniques of offender therapy in Britain and U.S.A.** *International Journal of Offender Therapy*, 1968, Vol. 12(3), 119-126.—Discusses the rationale, aims, and techniques of offender therapy and adduces case material to illustrate points. The prime aim is to adjust the offender to society, utilizing both the positive and negative incentives provided by society and inherent in his particular situation. The reverse technique of group therapy, different members of the staff collaborating on 1 case and utilizing the latent helpfulness in the community and family, is described.—*Journal abstract.*

Juvenile Delinquency

8547. Cassel, Russell N. & Blum, Lawrence P. (U. Wisconsin-Milwaukee) **Computer assist counseling (COASCON) for the prevention of delinquent behavior among teenagers and youth.** *Sociology & Social Research*, 1969(Oct), Vol. 54(1), 72-79.—Discusses delinquency as the unsatisfactory development of an ego-ideal compatible with the culture. It is suggested that at the beginning of junior high school, a comprehensive assessment be made of all teenagers with Ego-Ideal and Conscience Development Tests (EICDTs). The content and development of the EICDTs are described. Research with Computer Assist Counseling (COASCON) is reviewed and the success of this approach examined in terms of improved EICDTs scores. (22 ref.)—*S. Knapp.*

8548. Deeths, Adele. (Charila Foundation, San Francisco, Calif.) **Psychodrama crisis intervention with delinquent male drug users.** *Group Psychotherapy*

& *Psychodrama*, 1970 (Vol. 23(1-2)), 41-44.—Presents the case history of the use of psychodramatic techniques in an attempt to break through the traditional "gaming" procedures designed to keep others away and to shut off real feelings. Participants were 6 male adolescent drug users.—A. Krichew.

8549. Haesler, W. T. (200 Witikonstr., Zürich, Switzerland) **Psychotherapie bei Delinquenten während des Strafvollzuges.** [Psychotherapy of delinquents during infliction of punishment.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1970 (May), Vol. 20(3), 104-114.—Psychotherapy for delinquents under penal law is still critically lacking in Switzerland. However, since 1964 a progressive institution for 118 1st time delinquent offenders has been in operation in Saxerriet, Saint Gallen Canton. This is an open-door institution, and over 1/2 of the inmates are sexual offenders. Therapy consists of 2 group sessions of 75 min. each, plus individual therapy. Analysis-oriented therapy has proved useful in the resocialization of inmates, as illustrated by 3 brief case studies. The use of behavioral therapy with sexual delinquents is recommended. (22 ref.)—*English summary.*

8550. Kuenstler, William H. (U. Houston) **Differential effects of positive and negative social reinforcement on juvenile delinquents and Sunday school students.** *Dissertation Abstracts International*, 1970 (Sep), Vol. 31(3-B), 1541-1542.

8551. Mukerji, Biren. **Juvenile delinquency in West Bengal.** *Samiksa*, 1968, Vol. 22(3), 87-100.—Traces the rise in juvenile delinquency in Calcutta, India from the prewar period, through World War II into the postwar years, and discusses delinquency (a) as a world-wide problem, and (b) as a result of poor socioeconomic conditions. The role of overcrowding, broken homes, unhealthful youth associations, truancy, poverty, and heredity are examined with respect to delinquents in West Bengal. Needs and methods of prevention and rehabilitation on a professional level, among which community social and health services are paramount are outlined.—T. N. Webster.

8552. Orgel, Samuel Z. **Delinquency.** *Samiksa*, 1968, Vol. 22(3), 81-86.—Considers 2 types of delinquents: those receiving too little genuine love but an excess of indulgence; and those with conflicts normal to the child's development of emotional attachment, especially to deviations or distortions of Oedipus complex attitudes. The social maladjustments of the 2nd type are discussed from the aspect of (a) ego development, (b) rebellion against parental demands and hostility, (c) development of defenses against impulses, (d) the child's tendency to displace his object relationships from emotionally important people to less important or even indifferent persons in the case of transitory maladjustments, and (e) complete suppression of phallic masturbation in serious cases. With a megalomaniac denial of external controls, indicating a lack of internal controls, "... superego development must wait on the growth of the rudiments of the ego." The delinquent's need for love and gratification is distorted into a need to hate and rebel. It is concluded that the delinquents' denial that the adult world, or the "establishment" has any right over them results in acting out, masking the "deficiencies of the ego.... This chronic acting out hinders the further development of the ego by attempting to circumvent reality rather than deal with it."—T. N. Webster.

8553. Rhodes, A. Lewis & Reiss, Albert J. (Florida

State U.) **Apathy, truancy and delinquency as adaptations to school failure.** *Social Forces*, 1969 (Sep), Vol. 48(1), 12-22.—Found 3 types of deviance in 12-18 yr. olds to be related to grades received in English. The relationships between English grade and apathy, truancy, or delinquency are shown to be largely independent of these controls: age, sex, reading skill, intelligence test score, occupational level of family, socioeconomic composition of school, and mother's educational aspiration for the S. Sex and educational aspiration of S tend to specify the degree of association between English grade and delinquency. Alternative explanations for the strong relationship between school failure and deviance are proposed. (21 ref.)—*Journal abstract.*

8554. Satten, Joseph; Novotny, Elizabeth S., Ginsparg, Sylvia L., & Averil, Stuart. (Menninger Foundation, Topeka, Kan.) **Ego disorganization and recidivism in delinquent boys.** *Bulletin of the Menninger Clinic*, 1970 (Sep), Vol. 34(5), 270-283.—A follow-up study of 162 boys released from a midwestern correctional institution in 1964 indicated that a meaningful association existed between level of ego disorganization and the boys' involvement in criminal activities after release from training school. "The formulation that many delinquent boys have major ego disorganization is supported by the finding that 21 boys in this sample (about 13%) were hospitalized in a mental institution since release from the training school.... It appears that a structured corrective environment is not enough to bring about lasting improvement in social behavior in boys with major ego disorganization... most of these boys do not benefit appreciably from incarceration in a reform school or prison.... the research findings reported in this paper suggest that it should be possible to screen out those juvenile offenders most likely to become habitual criminals. These boys could then be provided a treatment program specifically aimed at modifying ego functioning in a special structured setting. The premise is that early diagnosis of ego defects combined with some early remedial treatment rather than later incarceration should result in the rehabilitation of many more of these boys."—J. Z. Elias.

8555. Stein, Kenneth B., Vadum, Arlene C., & Sarbin, Theodore R. (U. California, Berkeley) **Socialization and delinquency: A study of false negatives and false positives in prediction.** *Psychological Record*, 1970 (Sum), Vol. 20(3), 353-364.—Investigated 2 types of predictive errors, false negatives and false positives, in the Socialization (So) scale of the CPI to determine if they existed as stable groups or whether they merely reflected random error. 27 pairs of delinquent (D) and nondelinquent (ND) Ss matched on low scores on the So scale and 33 matched pairs of high scorers were studied in relation to 41 psychological and social variables. In a secondary analysis 27 pairs of high and low So scale scoring NDs, and 57 pairs of high and low So scoring Ds were compared on the same 41 variables. The number of significant differences in the primary analysis far exceeded the amount expected by chance. The secondary analyses again reveal the diagnostic utility of the So scale. However, the use of a moderator variable, Legal and School Difficulty scale, in combination with the So scale improved prediction to the criterion. It is concluded that the false negatives and false positives "cannot be discounted merely as products of random error," and that they form definite groups. (31 ref.)—*Journal abstract.*

Homosexuality & Sexual Deviation

8556. Berest, Joseph J. **Report on a case of sadism.** *Journal of Sex Research*, 1970(Aug), Vol. 6(3), 210-219.—Defines sadism, classifies sadism according to degrees, and discusses the psychodynamics of sadomasochism. A case study of a model sadist is presented and analyzed.—E. B. Jaffa.

8557. Hoenig, J., Kenna, J., & Youd, Ann. (Memorial U., St. John's, Newfoundland, Canada) **A follow-up study of transsexualists: Social and economic aspects.** *Psychiatra Clinica*, 1970, Vol. 3(2), 85-100.—Evaluated the social adjustment brought about by change of name and National Insurance Card of 53 transsexualists. There seemed to be some improvement in work adjustment and some fall off in criminal activity. There was, however, no reduction in the number of Ss on National Assistance.—M. West.

8558. Maitra, Amal K. & Banerjee, Dipali. **Homosexual practices in institutionalised neglected adolescents: Intra-family dynamics and thematic phantasy.** *Bulletin of the Council of Social & Psychological Research, Calcutta*, 1967, No. 8, 13-19.—Investigated various sociological and psychological factors in 20 male adolescents (age 12-15) in a reformatory school in India who actively engaged in homoerotic practices. 20 inmates who did not take part in such activities served as the control group. Intensive clinical interviews were made and 6 selected TAT cards were administered to all Ss. Significant differences were found for S's relations to mother, father, and siblings, with indifference and hostility predominating. Feelings of depression, frustration, anxiety, and aggression reached significance ($p < .05$). Ss also differed from the controls in assumed sex role, symbolic content (sex), self-concept, and social set.—*Journal abstract.*

8559. Mandel, K. H. (U. Munich, Inst. of Psychology, W. Germany) **Probleme und Ansätze der Verhaltenstherapie bei männlichen Homosexuellen.** [Problems and initiation of behavior therapy with male homosexuals.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1970(May), Vol. 20(3), 115-125.—Discusses the problems of aversive conditioning of homosexual responses while considering the literature on behavior therapy in male homosexuals. Among the aversive methods developed to date, covert sensitization, as described by J. R. Cautela (see PA, Vol. 40:5586) is the most acceptable. The most important task in the treatment of homosexuals is establishing a stable heterosexual partner relationship. To accomplish this, a precise analysis and elimination of avoidance responses along with cultivation of erotic-sexual reactions to specific female stimulations is necessary. Visual stimulations play an important role in this process since it is through them that the chain of sexual interactions is elicited. These problems have been previously neglected in behavior therapy. A difficult aspect in the treatment of homosexuals is the development of a feeling of love for the heterosexual partner which is free of subliminal anxiety. (61 ref.)—*English summary.*

8560. Money, John & Brennan, John G. **Heterosexual vs. homosexual attitudes: Male partners' perception of the feminine image of male transsexuals.** *Journal of Sex Research*, 1970(Aug), Vol. 6(3), 193-209.—Examined the nature of the erotic partnership between 7 male transsexuals and their male partners. It was found that 5 of the male partners were younger than

the transsexuals who looked younger than their age, possibly because of the shift to a feminine hormonal balance. Partners were educationally and vocationally underachievers, but vocational reliability improved from the relationship. 5 of the relationships have existed from 4-5 yr.; 2 were terminated by divorce. All 7 were heterosexually experienced; 2 had homosexual experiences. Transsexuals project feminine cues to attract the erotic attention of a normal male. Problems in a transsexual marriage include coital adequacy of the surgically constructed vagina, interpersonal problems, and community and family acceptance.—E. B. Jaffa.

8561. Porter, Howard K. (Michigan State U.) **Prison homosexuality: Locus of control and femininity.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1549.

MENTAL DISORDER

8562. Alpert, Murray & Silvers, Kenneth N. (New York U., Medical School) **Perceptual characteristics distinguishing auditory hallucinations in schizophrenia and acute alcoholic psychoses.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 298-302.—Compared via a questionnaire the characteristics of auditory hallucinations experienced by 45 schizophrenics and by 18 patients with alcoholic hallucinosis. The alcoholics' hallucinations were localized in space and had a greater frequency than those of the schizophrenics; the frequency was relatively independent of emotional state. The schizophrenics' hallucinations had a cognitive taint, were poorly localized, and showed a sensitivity to emotional arousal. (19 ref.)—*Journal abstract.*

8563. Arioni, Bianca M., Reda, Giancarlo, & Lalli, Nicola. **Le frustrazioni precoci e le alterazioni della personalità.** [Precocious frustrations and personality changes.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 423-437.—A. M. Farfaglia—Defines psychopathic personality and the term constitutional psychopath, which involves hereditary factors and the environment in which a person begins his life. Several studies are presented to support the definition. Over a 6-yr period 335 adolescents with character disorders were observed. It was found that 11 elements were always present, e.g., obedience to a hedonistic principle, lack of a sense of guilt, normal intelligence, etc. 6 experiments involving baby animals which were taken away from the mother are referred to. In 100 adolescent girls, 50 had character disorders and 50 suffered from psychosis or neurosis. Of the 1st group, 23 had been in children's homes, 28 had disturbed mothers, 22 had disturbed fathers, and 13 were without a father. Of the 2nd group, only 4 had been in children's homes, 18 had disturbed mothers, 6 had disturbed fathers, and 6 had no father. Institutions, absence of parents, and disturbed parents were more frequent in patients with character disorders. (15 ref.)

8564. Bartemeier, Leo H. (Seton Psychiatric Inst., Baltimore, Md.) **Constitutional factors in the psychiatric history.** *Bulletin of the Menninger Clinic*, 1970(Sep), Vol. 34(5), 264-269.—The whole problem of hereditary predisposition, both healthy and unhealthy, is given scant attention "now that we have learned so much about the acquired factors in personality development and in psychopathological formations. We seem to be fascinated by these precious insights derived from Freud's discoveries, and we ignore all that he learned

about the inherited predispositions and their influence in the development of mental illness." The need for exploring the patient's family background is stressed.—J. Z. Elias.

8565. Castaldo, Vincenzo & Shevrin, Howard. (Union U., Medical Coll., Albany, N.Y.) **Different effect of an auditory stimulus as a function of rapid eye movement and non-rapid eye movement sleep.** *Journal of Nervous & Mental Disease*, 1970(Mar), Vol. 150(3), 195-200.—Stimulated 10 male 28-36 yr. old psychiatric patients by a specially arranged auditory stimulus during REM and NREM sleep. This stimulus can elicit primary and secondary process levels of responses. Analysis of the sleep reports showed that the stimulus influenced the content of NREM reports on a conceptual level—which is assumed to be related to secondary process thinking—while for REM reports this effect was not present. Results support the hypothesis of different levels of thought organization associated with REM and NREM sleep.—*Journal abstract*.

8566. Chethik, Morton & Fast, Irene. (U. Michigan, Medical Center) **A function of fantasy in the borderline child.** *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 756-765.—Describes borderline children as having made a partial commitment to the independent reality of the external world, but whose integration with external reality is markedly incomplete. Work with a patient group of 8 children focuses on their commitment to the narcissistic world of the pleasure ego, as expressed in the children's fantasies. This illusory world contains the seeds of further maturity and provides the libidinal base for further commitment to reality. The therapist, by actively participating in and encouraging the elaboration of the fantasies can (a) understand and work through "the fears that make the child cling so obdurately to the illusionary world," and (b) interject a representation of the external world through his presence. (21 ref.)—*Journal abstract*.

8567. Cohen, Melvin & Klein, Donald F. (Hillside Hosp., Glen Oaks, N.Y.) **Drug abuse in a young psychiatric population.** *American Journal of Orthopsychiatry*, 1970(Apr), Vol. 40(3), 448-455.—Divided 70 psychiatric patients with a history of drug abuse into 3 groups representing a continuum of involvement with drugs and compared them with 35 age and sex matched non-drug-using patients. Results indicate that heavy drug-users were more likely to be character disorders than psychotic, and were of higher intelligence than non-drug-users.—*Journal abstract*.

8568. De Martis, Dario. (U. Cagliari, Sardinia, Italy) **Aspetti psicoterapeutici delle caratteropatie.** [Psychotherapeutic aspects of character disorders.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 328-333.—The concept of character disorders has extraordinary dimensions if the following points are considered: (a) abnormal personalities involves a vast section of pathology; (b) the concept of reactive formation covers a great area of human motivation and behavior; (c) in every neurotic or psychotic situation, the study of character represents a very important aspect of the emotional system of the patient; (d) a bipolarity of neurosis and character disorders can be recognized in every patient. Thus, when a psychotherapist excludes character disorders, he commits an error of judgment because any patient he may treat is involved in character problems. The following are fundamental observations concerning psychotherapeutic treatment of character disorders: (a)

the classical relation "tête-à-tête" between doctor and patient has considerable limitations in the treating of character disorders; (b) this can be substituted by a group, e.g., psychotherapist and assistants; (c) "the biological conclusion... is that the therapeutic attitude should abandon the traditional neutrality and apply itself as a group... dedicated to an activity which shouldn't be of a directive nature."—A. M. Farfaglia.

8569. Frighi, Luigi. **Osservazioni sulla psicodinamica delle caratteropatie.** [Observations on the psychodynamics of character disorders.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 323-328.—How one's character is formed depends on his habits of adapting to the exterior world and to instinctive impulses. Character is an adjunct of the ego, and it depends on neutralized energy for maintaining its functions efficiently and for solving its conflicts with the internal and external world. Concerning the question of character, an anthropological dimension reveals (a) psychoemotive organization; (b) the connection between development and conflicts; (c) the balance between impulsion and means of expression; and (d) the efflorescence of juvenile crisis and its privileged forms in their relations with the ego. The development of character is related to the nature of energy put in motion. Since mental energy comes from impulses, one must study the relationships between the intensity of the energy required by the defenses and that of the instinctive exigencies applied to the various phases of maturation.—A. M. Farfaglia.

8570. Fusswerk-Fursay. **Crédibilité ou faculté de croire.** [Credivity or ability to believe.] *Annales Médico-Psychologiques*, 1970(May), Vol. 1(5), 665-699.—Reviews philosophic treatment of the faculty of belief, regarding belief as indispensable to human life. As the term often is used to mean religious belief only, an attempt is made to illustrate that the same basic concept, sometimes labeled faith, conviction, suggestibility or trust, is central to an understanding of human psychology. Janet realized the fundamental nature of belief-process and gave it a central position in his theory of the origins of psychopathological behavior; as did Bernheim in his work on suggestibility. Several case histories are presented in which hypnoanalysis is used to restructure the abnormal beliefs of schizophrenic and other mental patients.—H. E. King.

8571. Giberti, Franco. (U. Genoa, Italy) **Rilevi generali e nosografico-clinici sul problema delle cosiddette "caratteropatie."** [General and clinical-nosographical facts on the problem of the so called character disorders.] *Rivista di Psichiatria*, 1968(Jul), Vol. 3(4), 315-323.—The term "character disorder" is used (a) in the study and classification of personality, especially in French psychology; (b) in psychoanalysis concerning character neurosis; (c) in illnesses of organic origin, e.g., cerebral deterioration; and (d) in recent psychopharmacological contributions. In clinical studies the term is found in classical cases and borderline patients as well as in abnormal stereotypes of the 20th century. "It touches all 4 sides of a quadrilateral which has so-called normality at its base and neurosis, psychosis, and the psycho-organic syndrome at the other 3 sides." Different psychotherapeutic methods have contributed to the study of character disturbance resulting in (a) exactness of biological roots and somatic participation, (b) better discrimination between apparent psychotic behavior (internal conflict syndrome) and antisocial behavior, (c) more accurate evaluation of the sociopathic-psycho-

pathic structure, (d) greater exacting of social environment from case work studies, and (e) realization of how social learning can influence psychopathic behavior. (48 ref.)—*A. Farjaglia*.

8572. **Huffman, Robert E.** (Veterans Administration Hosp., Topeka, Kan.) **Which soldiers break down: A survey of 610 psychiatric patients in Vietnam.** *Bulletin of the Menninger Clinic*, 1970(Nov), Vol. 34(6), 343-351.—Covering the period May 1965–April 1966 analysis is presented in terms of sources of referral, military rank, racial and educational backgrounds, suicide attempts, and combat fatigue.—*J. Z. Elias*.

8573. **Klerman, Gerald L. & Paykel, Eugene S.** (Yale U., Medical School) **Depressive pattern, social background, and hospitalization.** *Journal of Nervous & Mental Disease*, 1970(Jun), Vol. 150(6), 466-478.—Reports differences in depressed patient groups admitted to 3 facilities in the same area—the psychiatric ward of a general hospital, a mental health center, and a state mental hospital. Ss were studied by interview, rating scales, and self-report questionnaires. Major differences were found among the 3 facilities regarding social class and other related social indices. The general hospital admitted Ss of highest social class, the state mental hospital patients of lowest social class, with the mental health center intermediate. Clinical differences were less striking but suggested a higher incidence of endogenous depression in general hospital Ss with an even higher incidence in Ss subsequently admitted to a clinical research ward. The state mental hospital group showed a particularly high incidence of recurrent illnesses. Results contrast with previous findings that when out- and inpatients are compared a continuum of degree of hospitalization can be demonstrated, in which the main distinguishing features are clinical rather than socio-demographic. Findings emphasize the heterogeneity of depression and the need for caution in generalizing from selected samples of depressives in clinical and biological research. It is suggested that, within a single level of hospitalization, social factors are the most important. (20 ref.)—*Journal abstract*.

8574. **Laplanche, Jacques.** **L'incendiaire.** [The pyromaniac.] *Laval Médical*, 1969(Dec), Vol. 40(10), 1062-1072.—Groups analyses of the pyromaniac according to 4 major categories: general theories, psychoanalytical theories, theories of neuroses and psychoneuroses, and special theories. This diversity of opinions, based on everyday experience, calls attention to the difficulty of dealing with the problem of the pyromaniac. It also teaches us the danger of considering the action of fire-setting as a disease; it is more a symptom revealing different diseases. (33 ref.)—*English summary*.

8575. **León, Carlos A.** (U. del Valle, Cali, Colombia) **El diablo y el almanaque.** [Satan and the calendar.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Jun), Vol. 16(2), 105-115.—Analyzed change in content of psychopathological hallucinations and delusions as a function of time. Clinical histories of 2 groups (1000 Ss each) of patients admitted to the San Isidro Psychiatric Hospital in Colombia were compared. Admission dates for 1 group were from August 1956 to September 1959 (Period I), for the other from August 1964 to January 1966 (Period II). Statistical analyses show that Ss from Period I had a greater occurrence of supernatural elements, e.g., Satan, while those from Period II had more natural elements, e.g., communication media, police, government agents, etc. Women

tended to show supernatural content more than men in both periods. It is concluded that differences in time periods are reflected in the content of hallucinations and delusions of psychiatric patients. (28 ref.)—*V. A. Colotta*.

8576. **Lewis, Frederick.** (U. Houston) **Relationships between changes in future time perspectives and psychopathology.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1542-1543.

8577. **Martin, A., et al.** (U. Paris at the Sorbonne, France) **Analyse d'un phénomène de double système linguistique chez une délirante interprétative.** [Analysis of a double linguistic system phenomenon in an interpretatively delirious person.] *Annales Médico-Psychologiques*, 1970(Jun), Vol. 2(1), 57-66.—Analyzes the delusional system of 1 patient in detail for its psychopathological interest and for the reminder it offers of the psychological development of all language systems. A method, called "psychonomatology," was developed to "explain mathematically" the significance of sounds and letters and to show the importance of this for individual human destiny, i.e., the influence of a person's name on his life. A linguistic analysis combined with a clinical history of the S's developing psychopathology, illustrate the utility of the system as a protective device for coping with affective crises. The genuine affective elements of language, well-known to professional writers and speakers, are acknowledged. The faulty premise of the delusion lay in the neglect of these in favor of a computational basis for discovering the significance of speech for behavior.—*H. E. King*.

8578. **Matthews, Arthur R.** (Illinois Enforcement Commission, Chicago) **Observations on police policy and procedures for emergency detention of the mentally ill.** *Journal of Criminal Law, Criminology, & Police Science*, 1970(Jun), Vol. 61(2), 283-295.—"This paper was presented as a lecture to police executives who attended the Law Enforcement Policy Development Seminar held by the Law Enforcement Study Center of the Social Science Institute of Washington University, St. Louis at Bromwoods, Missouri, March 7, 1968. The aim of the study was exploratory, to discover and identify the actual practices of the police and other agencies of criminal justice administration in use from state to state in dealing with the mentally disabled." Procedures used to move apparently mentally ill persons from the community to some place where care may be had are discussed and some of the implications of these practices for professional police policy are discussed.—*R. Gunter*.

8579. **McCordick, Sharon M.** (U. Colorado) **Moral reasoning and guilt in adjusted and maladjusted adults.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1544.

8580. **Miller, Peter M. & Drennen, William T.** **Establishment of social reinforcement as an effective modifier of verbal behavior in chronic psychiatric patients.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 392-395.—Paired a social stimulus ("good") with positive biological reinforcement (candy, brownies, cigarettes) over a series of sessions for 3 wk. in an attempt to establish "good" as an effective modifier of verbal behavior in 60 white male chronic psychiatric patients. A pre- and posttreatment verbal conditioning task was used to assess changes in animal noun operant rate as a consequence of the conditions present during this intervening period. Control groups receiving only the social stimulus during treatment (Group C₁, N=15), only biological reinforcement pre-

sented noncontingently (Group C₂, N=15), and receiving no intervening treatment (Group C₃, N=15) were used. Only the experimental group and C₂ Ss significantly improved their performance scores. They also showed a marked decrease in suspicious verbalizations and an increase in positive affect.—*Journal abstract.*

8581. Morris, Larry E. (12th U.S. Air Force Hosp., San Jose, Calif.) **"Over the hump" in Vietnam: Adjustment patterns in a time-limited stress situation.** *Bulletin of the Menninger Clinic*, 1970(Nov), Vol. 34(6), 352-362.—During 1966, 225 noncombatant patients at the Air Force Hospital at Cam Ranh Bay, Vietnam, were studied with particular reference to the kinds of adjustment reactions they manifested during the time-limited stress situation readily provided in Vietnam. Within this framework, psychiatric disability manifests itself in a diphasic curve. The 2 phases of this curve are discussed with reference to time of onset, etiology, clinical manifestations, treatment, and outcome. Emphasis is placed on the depressive reactions of the 2nd phase, particularly the relationship of the onset of illness to the midpoint and the recovery from illness once the midpoint has been reached.—*Journal summary.*

8582. Plag, John A., Arthur, Ransom J., & Goffman, Jerry M. (U.S. Navy, Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Dimensions of psychiatric illness among first-term enlistees in the United States Navy.** *Military Medicine*, 1970(Aug), Vol. 135(8), 665-673.—Of 11,000 Navy enlistees followed through the course of their 1st enlistment, 5.5% were admitted to the sick list for psychiatric problems, while an additional 3.2% were discharged for emotional problems. Individuals with psychiatric problems were found to have more physical illness and to achieve fewer promotions. Psychiatric patients differed from the control Ss in that they had completed fewer years of schooling, scored lower on the Armed Forces Qualification Test, had more feminine interests, fewer siblings, and more expulsions from school.—*G. A. Clum.*

8583. Pylyshyn, Zenon W. (U. Western Ontario, London, Canada) **Clinical correlates of some syntactic features of patients' speech.** *Journal of Nervous & Mental Disease*, 1970(Apr), Vol. 150(4), 307-316.—Describes the 1st phase of a research program directed at the mechanization of segmentation and classification of units of psychiatric interview text. A unit called an assertion is defined on the basis of a finite verb fulcrum. Statistics were gathered on the use of various assertion introducers and of various forms of the finite verb, and analyzed in relation to the patients' clinical features. The ability of such statistics to discriminate between diagnostic groups was compared with the discriminating power of such general style features as total number of spoken words, frequency of certain key words, type-token ratio, and frequency of certain paralinguistic phenomena. As a group the syntactic scores were much more sensitive discriminators of diagnostic category than the general style indices. Particularly sensitive indices were the frequency of: the perfect phase form of the finite verb, qualifying subordinators as assertion introducers, the passive voice, and occurrence of formally defined category of verb called the "state" and the "achievement" verb.—*Journal abstract.*

8584. Rayne, James T. (U. Connecticut) **The effect of perceived attitudes on expectancy for punishment by psychiatric patients.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1549.

8585. Ridges, A. Pauline & Harper, P. (U. Liverpool, England) **Pink spot: Is it a drug artefact?** *Psychiatry Clinica*, 1970, Vol. 3(2), 101-107.—Surveyed urine samples containing pink spot of 296 disturbed patients and found that drugs are not a requisite for pink spot production. Although drugs do not enhance the production of pink spot, they increase the difficulties in assessment and can in certain cases be identified on the chromatograph, e.g., chlorpromazine and thioridazine. A chromatographic abnormality which may be associated with antiparkinson therapy is reported.—*Journal summary.*

8586. Rushing, William A. (Vanderbilt U.) **Two patterns in the relationship between social class and mental hospitalization.** *American Sociological Review*, 1969(Aug), Vol. 34(4), 533-541.—A review of research on social class and mental illness suggests the hypothesis of 2 patterns: (a) a discrete relationship with the lowest class having a higher rate than all others but with little difference in rates for other classes; and (b) a continuous relationship, with rates systematically increasing with each drop in class status, but with an extremely large increase for the lowest class. Findings for 4650 21-65 yr. old male 1st admissions to 3 state hospitals over a 10-yr period support this hypothesis. Alternative interpretations of the relationship between social class and mental illness are considered. Since most interpretations posit a discrete pattern, they will have to be modified or extended to account for both patterns. (28 ref.)—*Journal abstract.*

8587. Schaeffer, Dirk L. (U. Alberta, Edmonton, Canada) **Patterns of premorbid and symptom behaviors in schizophrenic and depressed women.** *Journal of Nervous & Mental Disease*, 1970(Jun), Vol. 150(6), 449-465.—Conducted a multivariate analysis of the interrelationships of 10 factors of premorbid functioning and 4 factors of symptom behavior (derived from an original pool of 137 variables) on 100 schizophrenic and 100 depressed female mental patients. Differences in the patterns of interrelations of background with symptom factors delineated classical patterns linking backgrounds characterized by withdrawal to symptoms of apathy and paranoia in schizophrenics, and withdrawal and childhood rejection to dysphoria in depressed women. Moreover, the background factor of withdrawal appeared to account for most of the relationships ascribed to variables of parental discord by previous investigators. (20 ref.)—*Journal abstract.*

8588. Steiner, J., Jarvis, M., & Parrish, J. (U. London, Inst. of Psychiatry, England) **Risk-taking and arousal regulation.** *British Journal of Medical Psychology*, 1970(Dec), Vol. 43(4), 333-348.—Reports 3 experiments which illustrate some of the difficulties of experimental measures of risk-taking and which cast doubt on the validity of many of the methods usually used. After promising results in a pilot study using 12 medical students, 2 further experiments failed to show a relationship between an experimental measure of risk-taking and personality variables, or to distinguish between 25 psychiatric patients and 25 controls. On the basis of interview ratings of risk-taking, it was possible, however, to discriminate between 18 obsessional patients and 18 surgical controls, since the obsessional group was rated as significantly less risky. Moreover, at least among the surgical group, the ratings were related to scores on several of the scales of the MMPI. Data from the interview suggest reasons for the failure of the experimental measure since about a quarter of the Ss

adopted unusual attitudes to the task which invalidated it as a measure of risk-taking. Results of the ratings support a hypothesis put forward in which states of high arousal are predicted to be associated with low levels of risk-taking. (52 ref.)—*Journal summary*.

8589. **Sutker, Patricia B.** (Tulane U., Medical School) **Vicarious conditioning and sociopathy.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 380-386.—Examined electrodermal activity as a measure of vicariously instigated autonomic conditioning in a time-delay paradigm, using electric shock to a model as the UCS. 12 male uninstitutionalized diagnosed sociopaths were selected on the basis of previous diagnosis, MMPI responses, and a review of case histories. 12 male volunteer undergraduates were also administered the MMPI and served as controls. Results indicate that the sociopaths did not evidence a significant increase in electrodermal activity in anticipation of the UCS. The sociopaths, however, did produce specific GSRs of significantly greater magnitude to the presentation of the UCS than did the nonsociopaths.—*Journal abstract*.

8590. **Trillat, E.** (Maison Blanche Psychiatric Hosp., Neuilly-sur-Marne, France) **Regards sur l'hystérie.** [Hysteria.] *Evolution Psychiatrique*, 1970(Apr), Vol. 35(2), 353-364.—Traces the history of views on hysteria including those of (a) Charcot, whose clinical method was, as Freud noted, unsuited to purely psychological material; (b) Janet, interested in mechanisms, e.g., amnesia's relation to anesthesia and concluding that hysteria is a type of natural hypnosis, and its symptoms natural suggestions; (c) Babinski, whose neurological definition of hysteria left too many vital questions unanswered; and (d) Freud, whose clinical psychoanalytical method with respect to the neuroses was as revolutionary as that of the pathologists who had previously overthrown the clinical medical approach of the 18th century.—*T. N. Webster*.

8591. **Trivedi, M. M.** **The border line patient.** *Samiksha*, 1968, Vol. 22(2), 73-80.—Illustrates Melitta Schemideberg's concept of "a clinical entity . . . bordering (a) on normality, (b) on the neurosis, (c) on the psychogenic psychosis, and (d) on psychopathy," by presenting a case of borderline personality, a 32-yr-old male physician referred for dextroamphetamine addiction, impotency, and fits. A constant feature in the history was depersonalization and alienation, but no delusions or other psychotic features were noted. More asocial than antisocial, the S was totally unable to form any stable identification, develop object relations, or reciprocate feelings, except in sadomasochist relationships with his wife and mother. Lack of superego development was traced to lack of parental, particularly maternal establishment of prohibitions, and the father's failure to institute a proper oedipal situation. New methods to treat such patients are suggested.—*T. N. Webster*.

8592. **Vidal, Guillermo; Orlansky, Dora, & Smulever, Mario A.** **Desamparo infantil y trastorno mental.** [Childhood bereavement and mental disorders.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Mar), Vol. 16(1), 62-66.—The hypothesis that a higher degree of early childhood abandonment increases the severity of eventual mental disorder later in life, was explored in a study of early family background of 921 mental patients. A correlation was found between (a) psychopathy and early broken homes (by divorce), (b) psychosis in women and intact homes, (c) psychosis in men and broken homes and inversely with orphanage, (d) psychosis and

large families, and (e) psychopathies and small families. The finding that broken homes by divorce seem to be more associated with mental disorders than the lack of 1 or both parents due to death is emphasized. (English ref.)—*English summary*.

8593. **Vidal, Guillermo; Prece, Graciela, & Smulever, Mario.** **Convivencia y trastorno mental.** [Family structure and mental disorders.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969(Mar), Vol. 15(1), 55-65.—Studied family size, birth order, and family integrity for each of a sample of 1322 psychiatric patients. It was found that neurotics showed smaller families, 1st birth order positions, and intact families, whereas psychotics showed larger families, later birth order positions (only female patients; male psychotics did not show this latter difference), and intact families.—*English summary*.

8594. **Weiss, Morris & Burke, Autheta.** (Hawthorn Center, Northville, Mich.) **A 5- to 10-year followup of hospitalized school phobic children and adolescents.** *American Journal of Orthopsychiatry*, 1970(Jul), Vol. 40(4), 672-676.—Little difficulty resuming school after hospitalization was experienced by 14 8-16 yr. old children given residential treatment for school phobia. In fact, they became earnest school workers. Their social adjustment, however, reflected some degree of isolation, and their original psychological status remained unchanged.—*Journal abstract*.

Neurosis & Emotional Disorder

8595. **Chaudhury, Anjali.** **A case of hysteria.** *Samiksha*, 1968, Vol. 22(3), 101-109.—Describes a 28-yr-old woman whose hysteric attacks are seen as an escape from guilt feeling associated with intense oedipus desire, the predominating symptom being acute anxiety concerning being unable to sleep, while actually suffering from insomnia. Fear of sexual involvement during sleep, unwillingness to be deprived of her oedipal sex fantasy during sleep, and fear of missing loved persons during sleep were involved in the mechanism of her insomnia and other disorders.—*T. N. Webster*.

8596. **Christozov, Christo & Dascalov, Dimitre.** (Psychiatric Clinic, Faculty of Medicine, Sofia, Bulgaria) **Corrélations clinico-électroencéphalographiques des terreurs nocturnes et du somnambulisme chez les enfants.** [Correlations between clinical and electroencephalographical findings in children with night terrors and somnambulism.] *Acta Paedopsychiatrica*, 1970(Feb), Vol. 37(2-3), 61-67.—Among 50 girls and 100 boys under 18 yr. of age affected by night terrors and somnambulism, etiological factors (psychotrauma, cerebral inflammatory processes, prenatal damage, brain damage, and intellectual overburdening) could be demonstrated in 49. An EEG was done in 240 cases. In 5, the result was normal, in 25 focal anomalies were shown, and in 120 there were diffuse anomalies of a great variety. From the etiopathogenetic viewpoint, pavor nocturnus and somnambulism are nonspecific. They may be associated with epilepsy, with or without clinical signs. In the majority of cases the origin is psychogenic.—*G. Rubin-Rabson*.

8597. **Friedman, Alfred S.** (Philadelphia Psychiatric Center, Pa.) **Hostility factors and clinical improvement in depressed patients.** *Archives of General Psychiatry*, 1970(Dec), Vol. 23(6), 524-537.—Hypothesized that changes in aggression and hostility would be significantly correlated with clinical improvement in

depressed patients. The Buss-Durkee Inventory was used to measure hostility and aggression and yielded scores under the following subtypes: assault, indirect aggression, negativism, verbal hostility, resentment, suspicion, and internalization of anger. Ss were 534 depressed inpatients who were part of a larger 10-hospital collaborative study, and 98 nondepressed controls drawn from the community. 213 depressives completed all evaluation measures during the 7-wk study period. Results show significantly less verbal hostility and more resentment among depressives than controls. Depressives, upon improvement, showed even less verbal hostility than when depressed. The relevance of the various findings to psychoanalytic theory is discussed. (21 ref.)—*P. McMillan*.

8598. Kornhaber, Arthur. (27 The Terrace, Katonah, N.Y.) **The stuffing syndrome.** *Psychosomatics*, 1970(Nov), Vol. 1(6), 580-584.—Deals with the identification and delineation of the stuffing syndrome as a distinct clinical entity. The diphasic nature of eating patterns in the depressed patient is discussed, and it is shown that the anorexia phase of depression is preceded by a hyperphagic compensatory phase which is a sign of impending depression. A therapeutic approach, including close structure by the physician, and psychopharmacological attack upon the syndrome of hyperphagia and withdrawal, is outlined.—*Journal summary*.

8599. Marks, Isaac M. (Inst. of Psychiatry, London, England) **Agoraphobic syndrome: Phobic anxiety state.** *Archives of General Psychiatry*, 1970(Dec), Vol. 23(6), 538-553.—Reviews the clinical features of the agoraphobic syndrome. Data is discussed from a study of 2000 agoraphobics (mean age of onset, 28) throughout Britain who belonged to a correspondence club called the Open Door. A table showing questionnaire replies from 900 female club members is included. The syndrome typically affects young adults, is commoner in women, and runs a fluctuating course over several years, though short-lived episodes are not common. The syndrome is characterized by a cluster of phobias centering around going into public places and is often accompanied by other nonphobic symptoms, e.g., free-floating anxiety, mild depression, depersonalization, and mild obsessions and compulsions. 2 case histories are described, and a table showing comparative features of published series of phobias is included. (50 ref.)—*Journal summary*.

8600. McNeil, Elton B. (U. Michigan) **Neuroses and personality disorders.** Englewood Cliffs, N.J.: Prentice-Hall, 1970. viii, 176 p.

8601. Sarnoff, Charles A. **Symbols and symptoms: Phytophobia in a two-year-old girl.** *Psychoanalytic Quarterly*, 1970(Oct), Vol. 39(4), 550-562.—Presents the case of a 27-mo-old child who was treated psychoanalytically because of bad dreams. The relationship between symbol and a symptom is discussed. "Symbols are the basis of culture and civilization as well as neurotic symptoms." *J. Z. Elias*.

8602. Sirota, Milton. (State U. New York, Downstate Medical Center, Brooklyn) **Urine or you're in: An ambiguous word in its relation to a toilet phobia in a two-year-old.** *Psychoanalytic Study of the Child*, 1969, Vol. 24, 252-270.

8603. Spiegel, Rose. (William Alanson White Inst., New York, N.Y.) **Cólera, furia, y agresión en los estados depresivos.** [Anger, rage, and aggressiveness in state of depression.] *Revista de Psicoanálisis, Psichi-*

atria y Psicología, 1968, No. 10, 54-65.—Discusses how anger, rage, and acting out in depressed patients function as a mask for depression and presents 3 case studies to illustrate the different manifestations of this masking and the various objects of anger. Differences between anger and rage are examined (rage being more violent). Anger is to rage what sorrow is to depression. Both can be verbal or expressive, and show signs of manic-depression, hostility, anxiety or guilt. A low level in productive activity, corporal movement and thought processes are results. It is assumed that sadistic aggressiveness can become necrofilic aggressiveness. The search for an underlying depression by the therapist is suggested as a means of unmasking anger, rage, and acting out.—*S. Maze*.

8605. Tonks, Clive M., Paykel, Eugene S., & Klerman, Gerald L. (U. Leeds, England) **Clinical depressions among Negroes.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 329-335.—Tested the concept that depressions among Negroes are associated more with somatic complaints and less with guilt and suicidal trends. A comparison was made of 31 Negro and 187 white depressed patients. Initial comparisons, controlled for social class, showed differences on 6 individual symptom ratings. Further analysis indicates that the principal difference lay in generally less severe illness among Negro patients rather than less specific features. Possible explanations are discussed. (23 ref.)—*Journal abstract*.

Psychosis

8606. Assael, M. & Winnik, H. Z. (Hebrew U., Hadassah Medical School, Jerusalem, Israel) **Electroencephalographic findings in affective psychoses.** *Diseases of the Nervous System*, 1970(Oct), Vol. 31(10), 695-701.—Investigated EEG records of selected patients to determine the relationship, if any, between EEG pattern and clinical diagnosis. Data were obtained from records of 100 45-60 yr. old Ss, who had no history of present or past cerebral lesions and had not received ECT in the last 12 mo. Results indicate (a) a correlation between abnormal findings in EEG records and the occurrence of depressive phases in affective psychoses, their simultaneous appearance, and EEG reversibility accompanying the fading of the morbid clinical phase; and (b) "the focus of functional disorders invariably pointing to the temporal lobe as 1 of the principal sites of elaboration or reflection of affects in depressive psychoses." 3 illustrative case histories, with EEG samples for 2 of them, are provided. (30 ref.)—*P. McMillan*.

8607. Fischman, D. A., Meltzer, Herbert Y., & Poppel, R. W. (U. Chicago) **Disruption of myofibrils in the skeletal muscle of psychotic patients.** *Archives of General Psychiatry*, 1970(Dec), Vol. 23(6), 503-515.—Performed skeletal muscle biopsies on 83 human Ss, including 42 who were acutely psychotic and 10 normal controls. Biopsies were examined by light and electron microscopy for evidence of skeletal muscle pathological abnormalities. In 16 acutely psychotic Ss, and in 4 of 9 chronically schizophrenic Ss, substantial disruption of myofibrillar architecture was noted. The most common myofibrillar alteration was an extensive spreading of

Z-band material, and, in 4 acutely psychotic Ss, the deposition of crystalline rod-body inclusions similar to those found in cases of nemaline myopathy. The specificity of these alterations in muscle structure and the possible relevance to psychiatric disease is discussed. (45 ref.)—*Journal summary.*

8608. Guyotat, Jean. (Neurologic Hosp., Lyon, France) **Aspects du narcissisme dans les psychoses: Réflexions à partir d'expériences de thérapie institutionnelle et de certaines chimiothérapies.** [Aspects of narcissism in psychoses: Considerations based on experience with institutional therapy and certain types of chemotherapy.] *Evolution Psychiatrique*, 1970(Apr), Vol. 35(2), 321-342.—Summarizes the development of the psychoanalytical concept of narcissism, and explores those aspects of the psychotic's narcissism which affect staff members, including psychiatric trainees, with respect to their own narcissism, defense mechanisms, and reactions. It is stressed that through the narcissism of the staff member, the narcissism of the psychotic can be approached and the patient treated. Cathexis of thought by the psychotic, during his struggle against self-division, influences the thoughts of staff members. Both patient's and staff's idealization processes during the development of a narcissistic object relationship by the psychotic are examined according to their structuring function or disturbing effects (depression, suicide attempts, or runaways). By study of the psycholeptic or psychodysleptic effects of antidepressive chemotherapy, further clarification of the narcissistic function of the psychotic can be accomplished.—*English summary.*

8609. Meltzer, Herbert Y. & Engel, W. King. (Pritzker Medical School, U. Chicago) **Histochemical abnormalities of skeletal muscle in acutely psychotic patients: II.** *Archives of General Psychiatry*, 1970(Dec), Vol. 23(6), 492-502.—Reports results of a histochemical examination of muscle biopsies of 52 acutely psychotic patients and 5 family members. Data indicate that 22 psychotic Ss of all diagnostic types had significant myopathic changes by biopsy. 2 additional Ss had borderline abnormalities. An alkaline phosphatase reaction was particularly useful in identifying abnormal fibers as they were darkly stained. The myopathic changes were present in various patients shortly after the onset of psychosis, and were detectable for as long as 12 mo. after an acute psychotic episode in some Ss. Phenothiazine medication could not be correlated with the presence of myopathic changes. The intensity of myopathic changes was correlated with the peak serum creatine phosphokinase activity in acutely psychotic male Ss but not in females. 1 of 5 chronically schizophrenic Ss, 2 of 22 nonpsychotic hospitalized psychiatric Ss, and none of 7 nonpsychotic drug-abuse Ss had myopathic changes by biopsy. 1 of 4 nonpsychotic relatives of acutely psychotic patients had borderline myopathic changes by biopsy. 2 parents, who had histories of acute psychoses, had biopsies which were definitely abnormal. (26 ref.)—*Journal summary.*

8610. Meltzer, Herbert Y. & Moline, Ronald. (Pritzker Medical School, U. Chicago) **Muscle abnormalities in acute psychoses.** *Archives of General Psychiatry*, 1970(Dec), Vol. 23(6), 481-491.—Monitored the activities of creatine phosphokinase (CPK) and other enzymes in the serum of acutely psychotic patients and their relatives, chronically psychotic patients, and neurotic patients as part of a comprehensive search for

evidence of myopathy in acutely psychotic patients. Results indicate increased activity of CPK in 44 of 64 acutely psychotic Ss of all diagnostic types and in 31 of 75 parents or siblings of these Ss. 7 acutely psychotic Ss had persistently increased activity of CPK. Increased aldolase and aspartate aminotransferase activities were found in 25 of 43 and 9 of 50 acutely psychotic patients, respectively. No increases in the activity of serum lactic dehydrogenase, phosphohexose isomerase, malic dehydrogenase, glutamic dehydrogenase, and isocitric dehydrogenase were observed. Increased activity of serum CPK was found in 1 of 8 chronic schizophrenics and in 2 of 22 nonpsychotic psychiatric Ss. Total CPK activity, subcellular distribution of CPK isoenzyme type of CPK, and total glycogen were normal in muscle biopsy specimens from acutely psychotic Ss. No creatinuria was present. (62 ref.)—*Journal summary.*

8611. Müller, C. & Ciompi, L. (Eds.) **Senile dementia.** Bern, Switzerland: H. Huber, 1968. 149 p.—Presents and discusses each of a collection of papers read at the 1967 International Symposium on Senile Dementia, held at Lausanne, Switzerland.—*J. D. London.*

8612. Reich, Theodore & Winokur, George. **Postpartum psychoses in patients with manic depressive disease.** *Journal of Nervous & Mental Disease*, 1970(Jul), Vol. 151(1), 60-68.—Examined 20 bipolar manic depressive mothers and 29 female family members who had children and an episodic affective disorder with respect to their postpartum state. The frequency of postpartum breakdowns was significantly greater than the frequency of nonpuerperal episodes during the period at risk of 15-80 yr. and during the childbearing years. Postpartum episodes followed 30% of births of the patient group and 20% of the births of the family group. 40% of the patients with children and 41% of the family members with children and affective disorder had a postpartum episode. These rates are much higher than population rates. After the 1st episode of manic depressive illness, the rates for postpartum illness were 50% in the patient group and 25% in the family group, suggesting that careful observation and early treatment is indicated. 83% of postpartum episodes occurred during the 2 mo. following parturition and symptoms during these episodes were similar to nonpuerperal manias and depressions. (23 ref.)—*Journal abstract.*

8613. Richman, Joseph & White, Harvey. (Albert Einstein Coll. of Medicine, Yeshiva U.) **A family view of hysterical psychosis.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 280-285.—Reexamined the phenomenon of hysterical psychosis in view of the newer family concepts of psychiatric disturbances. In 4 patients studied, the illness was associated with anxiety related to death, aggression, and actual object loss; every patient was suicidal; and the psychotic symptoms were family syndromic. The psychosis was of special relevance to dominant family problems, themes, myths, and fantasies. It is concluded that family factors are crucial to the understanding of the development of this disorder. (25 ref.)—*Journal abstract.*

8615. Rossi, R. & Delmonte, P. (U. Genoa, Inst. of Psychiatry, Italy) **Die cycloide Psychose in den italienischen diagnostischen Modellen.** [Cycloid psychosis in Italian models of diagnosis.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(Aug), Vol.

22(8), 289-293.—Reports results from 45 Italian psychiatrists who each completed the Overall and Gorham Brief Psychiatric Rating Scale (BPRS) for conceptually representative cases of each of 12 functional psychoses. According to the authors the Italian model is quite different from a German one for cycloid psychoses. Italian psychiatrists are apparently agreed that cycloid psychosis is a depression syndrome with some paranoid symptoms. (18 ref.)—*K. J. Hartman.*

8616. Schulte, W. & Mende, W. (Eds.) **Melancholie in Forschung, Klinik und Behandlung.** [Melancholy: Research, clinical picture, treatment.] Stuttgart, W. Germany: Georg Thieme, 1969. 236 p.—Presents a collection of articles, based on papers presented at a 1968 congress on depressive psychoses, held at Baden-Baden, West Germany. 7 categories are discussed: (a) course, genetics, and clinical picture; (b) quantitative evaluation; (c) transcultural aspects; (d) psychodynamics and psychotherapy; (e) biochemistry; (f) pharmacotherapy; and (g) social psychiatric aspects.—*I. D. London.*

8617. Wadson, Harriet S. & Bunney, William E. (National Inst. of Mental Health, Lab. of Clinical Science, Bethesda, Md.) **Manic-depressive art: A systematic study of differences in a 48-hour cyclic patient.** *Journal of Nervous & Mental Disease*, 1970(Mar), Vol. 150(3), 215-231.—Presents a blind study of spontaneous art productions in the manic-depressive psychosis, focusing on changes in pictorial expression associated with intrapsychic changes occurring in the disease. A 40-yr-old female patient with rapid and dramatic mood swings (alternating mania and depression every 24 hr. with no interim normal period) was studied. The evaluation of the pictures is divided into a study of form and affect, and a study of content. Different pictorial characteristics of color, linear style, configurations, organization, and affect were hypothesized to be associated with each phase of the illness. A sample of S's pictures was selected based on independent nursing staff behavioral ratings of mania and depression. Using a blind rating procedure, 7 judges rated each picture "manic" or "depressed," using these characteristics as a guide. Results indicate that use of the hypothesized characteristics enabled judges to improve their determinations of mania or depression at a statistically significant level. The most frequent recurrent themes and symbols in the patient's art work from each phase of the illness are presented. Speculations concerning their psychodynamic significance and their pictorial and symbolic interrelationships are discussed.—*Journal abstract.*

Schizophrenia

8618. Aminev, G. A., Bairamova, L. K., & Nikitina, E. V. (Kazan U., USSR) **K matematiko-lingvisticheskomu analizu sintaksicheskogo yarusu rechi bol'nykh shizofreniei.** [A mathematico-linguistic analysis of the syntactic aspect of speech in schizophrenics.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 408-413.—Utilized the written production of 23 paranoid schizophrenics during emerging remission in the analysis. The number of nonprojective syntactic structures in the written speech of schizophrenics did not differ from the normal, i.e., the law of projectivity of language was observed in the written speech of Ss exhibiting the paranoid form of schizophrenia. The processes of

"sequential synthesis" in speech activity, which are characterized by the number of dextrodirected syntactic connections predominate both in schizophrenics and in normals over the processes of "alerting synthesis." The processes are characterized by the number of levodirected syntactic connections; although in schizophrenia this predominance is expressed less markedly. Differing from the case for schizophrenia, the distribution of syntactic connections in normals approximated the exponential. The length of syntactic connections in schizophrenia was significantly higher than that in the normal state, providing an objective index of the presence of a certain clumsiness in the syntactic structure of the written speech of schizophrenics—explainable by postulating a "tendency to more prolonged fixation of individual words in speech transformation in operative memory." (English summary)—*I. D. London.*

8619. Barrass, B. C., Coult, D. B., Drysdale, A. C., & Marjot, D. H. (Chemical Defence Establishment, Salisbury, England) **Inhibition and activation of caeruloplasmin by extracts from the urine of schizophrenic patients.** *Biochemical Pharmacology*, 1970(May), Vol. 19(5), 1675-1679.—Extracts of 24-hr samples of urine from male schizophrenic patients accelerated the caeruloplasmin-catalyzed oxidation of noradrenaline but inhibited the oxidation of 5-hydroxytryptamine; these effects were not observed with extracts prepared in an identical manner from the urine of male preoperative patients or staff controls. The oxidation of noradrenaline by caeruloplasmin was inhibited by extracts of urine from some members of each group and the oxidation of noradrenaline by cupric ions was catalyzed by some of these urine extracts.—*Journal abstract.*

8620. Cameron, John L. (Chestnut Lodge Research Inst., Rockville, Md.) **Symbolism in the treatment of schizophrenia.** *British Journal of Medical Psychology*, 1970(Sep), Vol. 43(3), 257-263.—Presents clinical material to illustrate various aspects of schizophrenic symbolism. The minute interactions occurring in the interplay between the therapist and his patient are emphasized. The "merging and obscuring" of the schizophrenic's identity is also examined.

8621. Carter, Ross E. (Michigan State U.) **Rorschach signs, thinking disorganization, and withdrawal in process and reactive schizophrenics.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1531.

8622. Chatterjee, Tarit K. **A study of the personality of the parents of the schizophrenics.** *Samiksha*, 1969, Vol. 23(1), 22-48.—Studied the pathogenic role of parental personality traits in the development of childhood schizophrenia. The personality structures and family dynamics of 25 pairs of Indian parents of schizophrenics were examined by open-ended interview, Rorschach, and TAT, which were evaluated by a specially devised rating scale. The mothers of schizophrenic children (as contrasted with controls) were found to be (a) aggressive, though superficially friendly, with an unconscious tendency to deny their rage-complex; (b) satisfied with themselves, possessive of their children, experiencing conflict about giving, desiring to live a parasitic existence while meeting their own personal needs; (d) unaware of their own hostility; and (e) desiring to control their children. They also felt deprived and insecure, experiencing others as hostile. The fathers of schizophrenic children were revealed as weak family figures, insecure in their masculinity, and handling their

hostile impulses by projection; brought up under unusually strict conditions, they also saw the environment as hostile. (70 ref.)—*T. N. Webster.*

8623. Cheng, Fayu & Huang, Kue-hwa. (National Taiwan U., Taipei) **Conditioning of alpha rhythm blocking with schizophrenics.** *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 24-32.—Examined "the conditionability of schizophrenics" through the use of EEG responses to the combination of a tone and a light. 13 17-45 yr. old schizophrenic patients were compared with 17 19-30 yr. old undergraduates in the conditioning alpha wave to a tone stimulus of 2-sec duration. By combining the anticipatory and CRs in the conditioning and test trials, respectively, differences between the 2 groups were found. 2 schizophrenics and 7 normals had 3 consecutive CRs without statistical support for differentiating them. This negative experimental fact may have resulted from the instability of the alpha wave. The measuring ration method and the subjective observation method are not adequate to study conditioning of EEG. (17 ref.)—*Journal abstract.*

8624. Ehler, Betty J. (U. Iowa) **Attributed maternal childrearing histories of adult male schizophrenics and performance under task-irrelevant censure.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1533-1534.

8625. Ekstein, Rudolf & Caruth, Elaine. (Reiss-Davis Child Study Center, Los Angeles, Calif.) **Levels of verbal communication in the schizophrenic child's struggle against, for, and with the world of objects.** *Psychoanalytic Study of the Child*, 1969, Vol. 24, 115-137.

8626. Fagan, Joen & Woodward, June. (Georgia State U.) **Comparison of the graphic differential and the semantic differential with schizophrenics.** *International Journal of Symbolic*, 1970(Apr), Vol. 1(3), 57-61.—A 5-concept semantic differential and a parallel graphic differential were administered to 25 hospitalized schizophrenics and 25 college student controls. The results for both groups on both tests are clearly similar on the evaluative factor. Both the normals and schizophrenics were consistent within groups on potency, but only normals showed parallel semantic and graphic differential responses on activity. The results suggest that the graphic differential may be a measuring instrument of choice with schizophrenic Ss, and further studies with this instrument are strongly recommended.—*Journal abstract.*

8627. Fischer, Edmundo. (Inst. Nacional de Salud Mental, Buenos Aires, Argentina) **Biogenic amines and schizophrenia.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 495.—Describes a quantitative colorimetric assay of bufotenin in the urine of 113 normal controls, 86 acute untreated schizophrenics, and 45 medicated or chronic schizophrenics. Results indicate that controls produced a mean value of 3.5 µg% of bufotenin compared to 16.6 µg% for acute schizophrenics. Only 26.6% of medicated schizophrenics eliminated quantities comparable to the acute group.—*P. McMillan.*

8628. Gittelman-Klein, Rachel; Klein, Donald F., Blumberg, Arnold G., & Levenstein, Sidney. (Hillside Hosp., Glen Oaks, N.Y.) **Relationships of the mecholyl test, premorbid asocial functioning, and long term outcome in schizophrenia.** *Journal of Nervous & Mental Disease*, 1970(Apr), Vol. 150(4), 301-306.—Attempted to determine whether magnitude of mecholyl response is related to premorbid characteristics and/or long term outcome in nonchronic

schizophrenics. In a study of 46 schizophrenics, ratings of premorbid asocial functioning were correlated with outcome. However, both of these patient characteristics were independent of the magnitude of a mecholyl-induced drop in systolic blood pressure. Similar results were obtained when the schizophrenic sample was combined with 33 nonschizophrenic Ss, suggesting that diagnostic variation among studies cannot account for contradictory results regarding the relationship between mecholyl response, process-reactive schizophrenia, and long-term outcome. (27 ref.)—*Journal abstract.*

8629. Hoffer, Axel & Pollin, William. (Massachusetts Mental Health Center, Boston) **Schizophrenia in the NAS-NRC Panel of 15,909 veteran twin pairs.** *Archives of General Psychiatry*, 1970(Nov), Vol. 23(5), 469-477.—Studied the incidence of schizophrenia in a sample of 15,909 twin pairs born in the United States between 1917 and 1927, in which both twins had served in the armed forces. 338 of the pairs were found with 1 or both diagnosed schizophrenic. In 225 pairs of established zygosity, the "corrected pairwise concordance rates were 15.5% in monozygotic twins and 4.4% in dizygotic twins." Overall incidence of schizophrenia in this sample (1.1%) was similar to that found in the general population and was no higher in the monozygotic than dizygotic group. It is concluded that genetic factors appear to play a limited role in the origin of schizophrenia, although the role that is played is significant because of the consistently higher morbidity within the monozygotic group. (30 ref.)—*P. McMillan.*

8630. Inderbitzin, Lawrence B., Buchsbaum, Monte, & Silverman, Julian. (St. Elizabeths Hosp., Washington, D.C.) **EEG-averaged evoked response and perceptual variability in schizophrenics.** *Archives of General Psychiatry*, 1970(Nov), Vol. 23(5), 438-444.—Obtained average evoked responses (AER) to 4 intensities of light and performances on a kinesthetic figural aftereffects perceptual task and the Witkin Rod and Frame apparatus from 11 paranoid and 12 nonparanoid schizophrenic patients. AER variability was correlated with perceptual performance, accuracy, and variability. Performance measures did not yield statistically significant differences between the 2 groups; however, more stable AERs, particularly at higher intensities, were found in the paranoid group. These findings, combined with other AER reports in the literature, suggest that the high performance variability reported in schizophrenics may result at least partly from variability in the perceptual process. (20 ref.)—*Journal summary.*

8631. Kingsley, Victoria C. (New York U.) **The effects of the double blind conflict and sex of the experimenter on the conceptual functioning and visual discrimination of male good and poor premorbid schizophrenics.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1541.

8632. Klonoff, Harry; Fibiger, Christopher H., & Hutton, Gordon H. (U. British Columbia, Div. of Psychology, Vancouver, Canada) **Neuropsychological patterns in chronic schizophrenia.** *Journal of Nervous & Mental Disease*, 1970(Apr), Vol. 150(4), 291-300.—Studied the psychiatric and psychological status of 66 chronic schizophrenics over an 8-yr period. These variables, as measured by the Malamud and Sands psychiatric rating scale and the WAIS, respectively, showed significant improvement during this period. The Halstead-Reitan test battery and several other neuropsychological tests reported to be sensitive to CNS

deficit were administered to the same group. With the exception of the sentence repetition test, the neuropsychological test performance of Ss was grossly impaired. Reliability measures were obtained using a test-retest technique and indicate that the test battery was highly reliable. The performance on the neuropsychological tests was found to be related to psychiatric status, certain demographic variables, and drug regime. The tests appeared to be more sensitive to the severity of the schizophrenic process than to the presence or absence of neurological deficit. (27 ref.)—*Journal abstract*.

8633. Laury, Gabriel V. (Suffolk County Family Court, Hauppauge, N.Y.) **A schizoid life style.** *New York State Journal of Medicine*, 1970(Nov), Vol. 70(22), 2809-2814.—Presents 7 case histories of compensated schizophrenic individuals. Factors, e.g., the right life style and the right career, may enable these individuals to function adequately in society. The adjustment, however, is vulnerable to any change in inner or outer life: loss of loved ones, financial reverses, illness, surgery, pregnancy, or emigration. In the event of breakdown, speedy and energetic treatment is recommended to return them to society before they adapt to institutional life. It is suggested that thorough knowledge of the mechanisms which enable the compensated schizophrenic to lead a nearly normal life will aid in the treatment of more seriously ill schizophrenics.—S. Knapp.

8634. Lichtenberg, Philip & Norton, Dolores G. (Bryn Mawr Coll.) **Honesty, trust, equality in the treatment of schizophrenia: An analysis of "I Never Promised You a Rose Garden."** *Pennsylvania Psychiatric Quarterly*, 1970(Spring), Vol. 10(1), 33-40.—The treatment of schizophrenia is explored on the basis of an analysis of the novel, *I Never Promised You a Rose Garden*. The novel is a sensitive and detailed presentation of the true experiences involved in the treatment and tentative return to the outside world of a hospitalized female adolescent schizophrenic. The experiences of the author are divided in terms of improvement and deterioration and are presented in tabular form. The experiences signaled out as particularly positive or therapeutic were honesty and truth in communication between people, trust and loyalty in social relations, and personal equality between individuals. These experiences were generally related to the tasks of treatment and confined to the relation of the patient to her therapist and other patients, rarely to other hospital staff members. It is concluded that the experience of the subject is relevant to most treatment of schizophrenia.—M. Walker.

8635. McPherson, F. M., Barden, Valerie, & Buckley, Felicity. **The use of "psychological" constructs by affectively flattened schizophrenics.** *British Journal of Medical Psychology*, 1970(Sep), Vol. 43(3), 291-293.—Tested 3 groups of 15 Ss: affectively flattened schizophrenics, nonflattened schizophrenics, and normals. Each S gave the main difference between the people in 5 pairs of photographs. Results confirm previous findings by F. M. McPherson, et al. (see PA, Vol. 44:21288) that affective flattening in schizophrenics is associated with their relatively infrequent use of psychological constructs when differentiating among people in photographs and an increase in the use of background constructs.—*Journal summary*.

8636. McPherson, F. M. & Buckley, Felicity. **Thought-process disorder and personal construct**

subsystems. *British Journal of Social & Clinical Psychology*, 1970(Dec), Vol. 9(4), 380-381.—Examined the effects on thought-process disorder when different classes of construct are used to indicate the same elements. 12 schizophrenics and 12 normal controls (students or hospital staff) rated 8 photographs of people according to psychological and to physical construct versions. Results show that on the psychological construct versions normals and schizophrenics were significantly differentiated from each other, but on the physical versions there were no significant differences. It is concluded that thought-process disorder affects different construct subsystems in varying amounts. This finding emphasizes the importance of the content of thought upon the degree of thought-process disorder.—P. McMillan.

8637. Ritvo, Edward R., et al. (U. California, Neuropsychiatric Inst., Los Angeles) **Increased blood serotonin and platelets in early infantile autism.** *Archives of General Psychiatry*, 1970(Dec), Vol. 23(6), 566-572.—Employed a highly reliable method of determining whole blood serotonin levels to obtain data from normal controls and 24 hospitalized children with documented cases of early infantile autism. Blood platelet determinations were done simultaneously on both populations. Results indicate the following: (a) both blood serotonin and platelet values were inversely related to age in the normal population; (b) mean serotonin levels and platelet counts were significantly higher in age-matched groups of autistics than in controls; and (c) mean serotonin/platelet values were not significantly different between age-matched groups of autistics and controls. However, there was a significantly greater variability of serotonin/platelet values within the youngest group of age-matched Ss compared to that of controls (24-47 mo.). This appears to be related to a significantly greater variability of platelet levels in autistic children. (24 ref.)—*Journal summary*.

8638. Romel', T. E. (Inst. of Psychiatry, Moscow, USSR) **Techenie periodicheskoi shizofrenii po dannym otdalennogo katamneza.** [Course of periodic schizophrenia according to the data of remote catamnesis.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 430-435.—Studied remote catamnesis of cases of periodic schizophrenia, disclosing (a) the major characteristics regularly marking the psychosis, (b) its course, and (c) the features of its outcomes. 37 male and 118 female 34-75 yr. olds (onset of psychosis, 12-40 yr.; duration, 20-56 yr.; hereditary predisposition in 71 families; psychopathy in 37 families) were observed. Most cases retained throughout the psychosis the phasic character of its course. Complications of the attacks did not occur. A reduction of productive symptomatology was observed. With the onset of the psychosis in puberty, infantilism was often encountered. A certain increase in frequency and duration of the attacks was observed in the involutional period. With respect to the frequency and character of the attacks in the remote stage of the psychosis, all cases were divided into 3 groups—those with complete absence of attacks, those with pronounced attacks, and those with a "continuous" type of the psychosis. Personality changes were more strongly expressed in the last 2 groups. (English summary) (49 ref.)—I. D. London.

8639. Roosen, C. J. **Het proces-reactief continuüm binnen de schizofrenie.** [The process-reactive continuum within schizophrenia.] *Nederlands Tijdschrift voor de*

Psychologie en haar Grensgebieden, 1970(Sep), Vol. 25(8), 497-532.—Presents a review of the literature. Results from experimental studies indicate that process and reactive schizophrenia are the ends of a continuum that indicate the prognosis of relief with reactive indicating the better prognosis. Patients at the process end are characterized by field-dependency in the inability to proceed beyond the literal interpretation of communication, avoidance of social behavior, improper behavior in the hospital, personality rigidity, and by the gradual onset of the illness. The patients at the reactive end are characterized by traits that are counter to those of the process type. The social milieu of the patient, the male patient being dominated by his mother, being unmarried, and the residence of the patient being in urban areas are correlated with process schizophrenia, with the 1st condition being the most significant. Several scales are described. The Phillips and the Elgin Prognostic scales were found to be the most exact and predictive of progress. (English summary) (4 p. ref.)—A. J. Ter Keurst.

8640. Smith, Edward E. (U. Wisconsin) **Short-term memory impairment in chronic schizophrenics.** *Canadian Journal of Psychology*, 1969(Apr), Vol. 23(2), 114-126.—Assessed the short-term memory capacities of 4 chronic, schizophrenic and 4 nonschizophrenic psychiatric patients who served as controls. The information to be remembered was presented both visually and verbally and was later probed for—after a variable interval—by either visual or verbal cues. Schizophrenics and controls did not differ with respect to which type of cue retrieved more of the information, suggesting that the modality in which the information was stored was the same for both groups. However, schizophrenics were markedly inferior to controls regarding both the initial acquisition of information and the maintenance of it in storage. (French summary)—*Journal abstract*.

8641. Sturm, Israel E. (Veterans Administration Hosp., Northport, N.Y.) **An attempt to dramatize the "double-blind" hypothesis of the schizophrenogenic family.** *Journal of Psychology*, 1971(Jan), Vol. 77(1), 55-66.—Presents a script which dramatized the "double-blind" theory of the etiology of schizophrenia. 2 family scenes were portrayed, 1 schizophrenogenic, the other not. Both sketches were involved with the problem of parents with a daughter who had come home too late from a party the night before. In neither family was anyone too likeable or pleasant. The only inappropriate element in the schizophrenogenic sketch was the incongruity of dialogue, gesture, and mood in the light of the context upon which the parents should have been focusing. Although the script was dramaturgically primitive, its enactment and evaluation could permit direct apprehension of the theoretical phenomenology of such morbid interaction and provide a concrete point of departure for discussions of the schizophrenogenic family interaction hypotheses of other theorists.—*Author abstract*.

8642. Sulestrowska, H. (Medical Academy, Danzig, Poland) **Studies on the causes of diagnostic and prognostic difficulties in childhood schizophrenia.** *Polish Medical Journal*, 1969, Vol. 8(6), 1505-1514.—Analyzed 30 cases of childhood schizophrenia with 1st admission to the hospital occurring below 10 yr. of age. Follow-up observations were conducted for at least 2 yr. and 1/2 of the cases were followed up for more than 9 yr. The diagnostic criteria of childhood schizophrenia and

the relation of this disease to organic brain damage are discussed. (32 ref.)—*Journal abstract*.

8643. Van Dyke, William K. (U. Iowa) **Effects of response-contingent and nonresponse-contingent censure on the reaction time of schizophrenic patients and non-psychiatric, medical outpatients.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1553.

8644. Watson, Stanley J. (U. Iowa) **Speech monitoring behavior of process and reactive schizophrenic individuals under filtered voice delayed auditory feedback.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1554.

8645. Watt, N. F., Stolorow, R. D., Lubensky, Amy W., & McClelland, D. C. (Harvard U.) **School adjustment and behavior of children hospitalized for schizophrenia as adults.** *American Journal of Orthopsychiatry*, 1970(Jul), Vol. 40(4), 637-657.—Compared the childhood public school records of 30 nonmigratory, hospitalized schizophrenic adults with those of 90 matched control children presumed to have become normal adults. It is concluded that a substantial proportion of children destined to be schizophrenic as adults can be identified by their behavior in public school before they break down. Boys showed primary evidence of unsocialized aggression and girls of over-inhibition. (37 ref.)—*Journal abstract*.

8646. Yeakel, Mary H., Salisbury, Lloyd L., Greer, Stephen L., & Marcus, Leonard F. (Walter Reed Army Medical Center, U. S. Army Medical Biomechanical Research Lab., Washington, D.C.) **An appliance for autoinduced adverse control of self-injurious behavior.** *Journal of Experimental Child Psychology*, 1970(Oct), Vol. 10(2), 159-169.—Describes an appliance designed to control the self-injurious behavior of a 14-yr-old female autistic child. The appliance, which is worn like a bonnet or hat, delivers an adverse electric shock to the arm of the patient whenever the head is struck either by the patient himself or some extraneous inanimate object. 2 methods of operating the switching mechanism and an inflatable, completely protective, device are also discussed.—*Journal abstract*.

8648. Bagster-Collins, Richard D. (U. Maryland) **The application of a kinesthetic work modality program to the behavioral modification of chronic psychiatric patients.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1528-1529.

8649. Branković, Zorica. **Psihoterapija duboko regresiranih schizophrenih pacijenata do izlaženja iz autističke faze.** [Psychotherapy of deeply regressed schizophrenic patients until their emergence from autistic phase.] *Psihologija*, 1969(Sep), Vol. 2(2), 475-

479.—Attempts to relent the effects of prolonged hospitalization on regressive schizophrenia in the course of a psychotherapeutic procedure. The main objective was emergence from the autistic phase, and the basic principle was to deal with not the personality but its passive-receptive attitudes. The fact that the status of regression is not an authentic quality of the past and was structured in accordance with the experiences of former feelings of security, accompanied by unavoidable burdens of prepsychotic provocations provides a starting point. Therapy is directed at: (a) the annulment of the link between autism and the elaborate forms of the fear of commitment, and (b) the control of the development from regression to the stage for which objectal relations are compensated. A modified form of play-therapy is employed. This procedure was used in the parallel individual psychotherapy of 2 autistic female patients with similar premorbid histories, clinical features, and courses of hospitalization. Results of the treatment are discussed. Effects of the treatment were verified by routine psychodiagnostic techniques.—*English summary.*

8650. Clark, Mervin L., et al. (U. Oklahoma, Medical Center, Oklahoma City) **Chlorpromazine in chronic schizophrenia: Behavioral dose-response relationships.** *Psychopharmacologia*, 1970, Vol. 18(3), 260-270. Administered orally fixed daily doses of chlorpromazine (CPZ), in amounts of 150, 300, and 600 mg., to 71 female 21-60 yr. old chronic schizophrenic inpatients for 24 wk. while psychiatric and ward behavioral responses were monitored at regular intervals. Within the dose range used response was shown to be dose related, particularly early in treatment (4-12 wk.). CPZ in the amount of 150 mg./day was an effective dose relative to placebo, but was generally less effective than 300 or 600 mg./day. Little difference in clinical response was demonstrable from 300-600 mg. doses, except in the frequency of side effects and possible speed of onset or therapeutic effects, both being greater in the 600-mg. group. (17 ref.)—*Journal abstract.*

8651. Crase, George E. (National Inst. for Mental Health, Bethesda, Md.) **Tardive dyskinesia in schizophrenic patients treated with psychotropic drugs.** *Aggressologie*, 1968(Mar), Vol. 9(2), 209-218. Describes a collaborative study of 7 hospital populations of chronic schizophrenics randomly assigned to 4 drug regimes at different dose levels. Approximately 500 Ss. aged 20-56, were assessed for the presence of tardive dyskinesia over a period of 12 mo. The final assessment revealed that 27% of Ss exhibited manifestations consistent with this neurological disorder. Symptoms localized in the oral region were higher in older Ss, but chorea, athetosis, and dystonia of the extremities decreased after 50. Moderate symptoms fluctuated in severity between assessments, whereas sustained and more severe manifestations persisted unchanged. Approximately 400 Ss were assessed for long-term effects of the 4 drug regimes on the incidence of dyskinesia. Ss who had been on a high dose regime (2000 mg./day of chlorpromazine) exhibited more dyskinesia than those on lower dosages, or placebo. This was particularly significant for Ss over 40. Data on the total intake of psychotropic drugs for periods up to 12 yr. were also available for 73 Ss. For this group, no relationship was found between dyskinesia and total intake of neuroleptics. In the majority of Ss, dyskinetic symptoms were conspicuous, but not such as to cause severe impairment or discomfort. Methodological problems of relating manifestations of tardive dyskinesia to drugs are discussed.—*Journal abstract.*

8652. Halpern, Werner I. (Rochester Mental Health Center, Children & Youth Div., N.Y.) **The schooling of autistic children: Preliminary findings.** *Journal of Orthopsychiatry*, 1970(Jul), Vol. 40(4), 665-671.—Presents a model whereby structured language training represents the educational core in teaching small groups of young autistic children. Language acquisition in a clinical classroom facilitated public school entry for a significant number of previous noncommunicators. 15 children under 7-yr-old with partial or total failure in the use and comprehension of verbal symbols were studied. (20 ref.)—*Journal abstract.*

8653. Holden, J. M. & Holden, U. P. (St. Louis State Hosp. Complex, Mo.) **Weight changes with schizophrenic psychosis and psychotropic drug therapy.** *Psychosomatics*, 1970(Nov), Vol. 11(6), 551-561.—Reports changes in weight patterns in relation to psychopathology, diagnosis, and age in a group of 22 male chronic schizophrenics treated over a prolonged period of time with placebo, chlorthalidone, and thioridazine, alone and combined. Results indicate that variations in appetite, motor activity, or agitation were not consistently associated with changes in weight. Significant relationships were shown, however, between increases in weight and improvement of psychotic symptomatology, and decreases in weight and worsening of symptomatology. Various mechanisms to explain weight changes with psychosis are discussed, but findings suggest that changes in weight are an expression of the basic illness. Only paranoid Ss gained weight with chlorthalidone. Hebephrenic Ss gained more weight with individual treatment than any other group, and this with chlorthalidone and thioridazine combined. With chlorthalidone, the older the patient, the greater the tendency to gain weight. With thioridazine and combined treatment, however, the greater gains in weight occurred in younger Ss. It is noted that weight changes were correlated inversely with hemoglobin and hematocrit shifts. These variations could also have been associated with variations in intensity of psychosis. (36 ref.)—*Journal summary.*

8654. Madalena, J. Caruso. **Ensaio preliminar sobre o biperideno injetável no tratamento das crises neurodislépticas induzidas por drogas neurolépticas.** [Preliminary study with injectable biperiden in the treatment of neurodisleptical crises induced by neuroleptics.] *O Hospital*, 1969(Aug), Vol. 76(2), 497-500. Studied the effects of biperiden (B) in doses of .005 gm. in 21 16-49 yr. old chronic schizophrenic males. Neurodysleptic crises were induced in 13 Ss by fluphenazine enanthate and in 8 Ss by prochlorperazine. IV injections of B resulted in the complete disappearance of crises in 1 min. for 63% of the Ss and in 2 min. for 37%. Effects from intramuscular injections of B occurred in 7.5 min. The duration of antineurodysleptic effects was an average of 10 hr. Excellent tolerance was observed in all Ss. (English summary)—P. Hertzberg.

8655. Martin, Garry L. & Pear, Joseph J. (St. Paul's Coll., U. Manitoba, Winnipeg, Canada) **Short term participation by 130 undergraduates as operant conditioners in an ongoing project with autistic children.** *Psychological record*, 1970(Sum), Vol. 20(3), 327-336.—An earlier, intensive, summer project by G. L. Martin (see PA, Vol. 43:2872) resulted in an effective therapy program for autistic children. The only assistance for continuing the program during the academic term was from 4 undergraduates skilled in operant conditioning (each available for 2 hr/wk) and under-

graduates enrolled in the author's courses. Under these conditions, a program was developed that maintained daily therapy sessions with autistic children, while giving training to inexperienced undergraduates. The children's progress was measurable, and the involvement of a large number of undergraduates in a structured therapy and research program appears to be very feasible. Data pertaining to the training of the undergraduates are presented, and variables thought to be important to the success of the program are discussed. (16 ref.)—*Journal abstract*.

8656. Prien, Robert F., DeLong, Samuel L., Cole, Jonathan O., & Levine, Jerome. (George Washington U., Biometric Lab.) **Ocular changes occurring with prolonged high dose chlorpromazine therapy: Results from a collaborative study.** *Archives of General Psychiatry*, 1970(Nov), Vol. 23(5), 464-468.—Treated approximately 210 19-55 yr. old chronic schizophrenic patients in a 6-mo multihospital collaborative study with high doses of chlorpromazine (2000 mg/day). Controls, in 3 groups of approximately 210 each, were treated with low doses of chlorpromazine (300 mg/day), placebo, or physician's choice of medication. Results of ophthalmologic examinations indicate that the high doses produced opacities in the lens, posterior cornea, and anterior cornea. These ocular changes were significantly related to photosensitivity, suggesting that Ss developing photosensitivity should receive a slit-lamp examination of the lens and cornea. Follow-up examinations 6-9 mo. after the study indicate relatively little improvement in lenticular and posterior corneal change, and suggest that anterior corneal lesions are reversible. (17 ref.)—*Journal summary*.

8657. Ramsay, R. A., et al. **Nicotinic acid as adjuvant therapy in newly admitted schizophrenic patients.** *Canadian Medical Association Journal*, 1970(May), Vol. 102(9), 939-942.—Conducted a placebo-controlled, comparative 6-mo clinical study to test the hypothesis that nicotinic acid or nicotinamide as adjuvant medications have a beneficial therapeutic effect over and above the effect which can be achieved by the administration of phenothiazine drugs alone. Results from 30 acute and subacute 19-51 yr. old newly admitted schizophrenic Ss show no statistically significant therapeutic difference between the active treatment and the placebo groups. It was shown that Ss in the placebo group received a lower total daily amount of phenothiazine drugs than those on either of the active substances. Furthermore, it was noted that the addition of the active substances did not reduce the number of days of hospitalization. (French summary)—*Journal abstract*.

8658. Singh, Man M., De Doo, Lilla V., & Kline, Nathan S. (Bronx State Hosp., N.Y.) **Weight as a correlate of clinical response to psychotropic drugs.** *Psychosomatics*, 1970(Nov), Vol. 11(6), 562-570.—Presents data from a longitudinal study of 14 male schizophrenic patients to correlate weight changes with changes in the clinical condition produced by a phenothiazine and a MAO inhibitor. Results indicate that: (a) Drug induced changes in schizophrenia showed a fairly consistent relationship to clinical response, significant weight gains (over 10 kg. in 6 mo.) being associated with a relatively good response, and small or no weight gains with poor response. (b) Both weight gain and clinical improvement tended to reach a plateau after 3-6 mo., suggesting that in cases who fail to respond in 6 mo. of medication, a longer trial is unlikely to prove successful. (c) Sudden

withdrawal of a phenothiazine seemed to be attended with a rather rapid decline in weight and clinical condition in Ss who showed gain in these respects when receiving the drug. (d) When a phenothiazine was started or stopped, the initial weight change was sometimes such that a change in caloric intake by itself was an inadequate causal explanation. In 2 cases where daily caloric intake was estimated, the weight loss in the 1st 3 wk. after withdrawal of the drug was greater than could be attributed to changes in caloric intake. (e) The mechanism of phenothiazine induced weight changes is poorly understood. Different possibilities, with supportive evidence are discussed. (17 ref.)—*Journal summary*.

PSYCHOSOMATIC DISORDER

8659. Brisset, Charles. (Clinic, 23 Rue Pradier, Ville-D'Avray, France) **Hystérie et psychosomatique: Les rapports de la structure et de l'histoire.** [Hysteria and psychosomatic disorders: Structural and historical relationships.] *Evolution Psychiatrique*, 1970(Apr), Vol. 35(2), 377-404.—Views the relationships between hysteria and psychosomatic disorders as a discontinuous variation of activity of impulse representation by fantasies. The repression of impulses produces a neurotic situation, in which hysteria occupies a major position. Repression of hysterical expression is a social and cultural fact that produces psychosomatic situations. Studying psychosomatic recoveries makes it possible to follow the opposite process, in which the therapist, inducing by his presence a renewal of fantasy activity, enables the patient to liberate his impulses and tolerate their expression by arranging a "real" neurotic situation basically hysterical because of its temporary transference expression. The physician is the most active agent in the repression of hysteria and hysterical impulses, even if the latter are temporary. Mutation of the psychosomatic fact is, therefore, a result of the present technological state of medicine.—*English summary*.

8660. Caston, Joseph; Cooper, Lowell, & Paley, H. W. (Mt. Zion Hosp., San Francisco, Calif.) **Psychological comparison of patients with cardiac neurotic chest pain and angina pectoris.** *Psychosomatics*, 1970(Nov), Vol. 11(6), 543-550.—Reports that 8 patients with cardiac neurotic chest pain had characteristics similar to those of 50 patients with angina pectoris with respect to history, symptom features, and in patterns of personality test data (MMPI), therefore making differentiation difficult. Differences were represented by the frequency of hyperventilation-associated symptom sequelae, the predominance of women, and psychological need for pain in the cardiac neurotic group. Hyperventilation may provide, physiologically, chest sensations which serve as a sensory nidus which is further elaborated into pain (as opposed to purely psychogenic pain). Over-breathing may also operate as a somatic prototype for oral-incorporative trends in response to intrapsychic or external stress, a hypothesis which conforms to the notable presence of oral-dependent strivings in cardiac neurotics. (37 ref.)—*Journal summary*.

8661. Crisp, A. H. (St. George's Hosp. Medical School, London, England) **Some psychosomatic aspects of neoplasia.** *British Journal of Medical Psychology*, 1970(Dec), Vol. 43(4), 313-331.—Neoplasia in the adult covers a number of different disease processes in the adult alone, each with many and possibly overlapping dimensions of causation. Several other factors are also found correlated with such disease but

are completely unrelated or not relevantly related to it in terms of cause or effect. Psychosomatic research is often mindful of these pitfalls, however, really central questions have yet to be asked. If cancer is not just the product of an isolated encounter, albeit chronic, between an external pathogen and an individual, then what are these predetermined constitutional factors created by what has gone before not only genetically but also by what has become built in to that individual's internal mind-body organizations, adaptations and maladaptations? (5 p. ref.)—*Journal summary*.

8662. Johnson, William G. (Catholic U. of America) **The effect of prior-taste and food visibility on the food-directed instrumental performance of obese individuals.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1539-1540.

8663. Savastano, Helena. **Perfil emocional constritivo de pacientes ulcerosos através do índice perfil de emoções de Plutchik.** [Constrictive emotional profile of ulcerative patients according to Plutchik's Emotional Profile Index.] *Revista de Psicologia Normal e Patológica*, 1969(Jan), Vol. 15(1-2), 129-136.—Tested 19 male and 6 female adults (mean age of 38) with ulcers. 18 Ss were Brazilian and 7 were of other nationalities. Results were analyzed according to age, sex, and nationality, and were compared to those of controls. Plutchik's Emotional Profile Index was proved valid and 2 hypotheses were confirmed: (a) emotional profiles of ulcerative Ss differed from controls, and (b) emotional profiles of ulcerative Ss were constrictive and ambivalent. Literature on the nature and psychosomatic origins of ulcers is reviewed. (English & French summaries)—*P. Hertzberg*.

CASE HISTORY

8664. Koluchová, Jarmila. (Palacky U., Olomouc, Czechoslovakia) **Hluboká a dlouhodobá psychická deprivace dětí v rodině.** [Severe mental deprivation of long duration in two children in a family.] *Psychológia a Patopsychológia Dietäta*, 1970, Vol. 5(2), 161-170.—Presents an unusual case of mental deprivation in 2 male monozygotic twins who had lived with their father and stepmother in total social isolation, concealed from the public, from the age of 18 mo. until the age of 7. The stepmother showed psychopathic traits, was extremely hostile toward the Ss, and had often locked them in a dark unheated room, starved, and cruelly chastised them. When removed from the family, Ss suffered from acute rickets, severe psychomotor and speech retardation, and had the mental development of a 3 yr. old and the speech of a 2 yr. old. After 1 yr. of treatment at a home for preschool children, Ss were placed in a foster family. Follow-up showed that mental development was progressing fast and speech was improving. Each Ss' MA was that of a 7 yr. old, they were in 1st grade and were being transferred from a special to a normal school, and the sequelae of deprivation in the emotional and social sphere had abated. Further follow-up is being undertaken to determine to what extent mental deficiency passes, and to study the long-term effects of severe deprivation on personality formation. (Russian summary)—*English summary*.

8665. Lazare, Aaron & Klerman, Gerald L. (Harvard Medical School, Boston, Mass.) **Camptocormia in a female: A five-year study.** *British Journal of Medical Psychology*, 1970(Sep), Vol. 43(3), 265-270.—Describes a

5-yr course of a female who developed camptocormia during a depressive illness. Camptocormia, or functional bent back, is a conversion reaction seen predominantly in soldiers. The symptom has rarely been reported in females. Verbatim interview material is presented to illustrate the nature of the conversion process as a defense against, as well as an expression of, instinctual impulses. Reports of camptocormia in men are reviewed to understand the maleness of the symptom. It was speculated that castration anxiety and homosexual panic are important issues in the development of the symptom in men. The lesser importance of castration anxiety in women together with the absence of a situation such as the army may account, in part, for the lower incidence of camptocormia in women. The case report supports the supposition that there is a high incidence from severe ego pathology in patients suffering from camptocormia. (17 ref.)—*Journal summary*.

8666. Lindenauer, Geoffrey G. (Inst. for Emotional Education, New York, N.Y.) **The other side of anger.** *Journal of Emotional Education*, 1969(Win), Vol. 9(1), 4-11.—Presents a case study of an 8-yr-old boy, who manifests frustration from an inability to communicate in frequent temper tantrums. The case study is used to illustrate how a child can "be taught methods of communicating his frustrations and handling it in a manner that is acceptable to society."—*S. Appelle*.

8667. Loffreda, Enrique. (Prof. Aroaz Alfaro Polyclinic, Provincia de Lanus, Argentina) **Síndrome de Gilles de la Tourette.** [Gilles de la Tourette syndrome.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Jun), Vol. 16(2), 164-172.—Describes a case of Gilles de la Tourette syndrome present in a 13-yr-old male who had presented tics for the last 3 yr. and speech disturbances during the last yr. Treatment was psychoanalytically oriented, lasted for 9 mo., and succeeded in a drastic reduction of the symptoms (confirmed at 1-yr follow-up). Improvement was quantified: there was a marked decrease of S's compulsive linguistic disturbances. It is argued that the disease is the result of short circuit type of dissociation of aggressive impulses; and the dynamic and economic character of this defense are discussed. (23 ref.)—*English summary*.

MENTAL HEALTH & REHABILITATION

8668. ———. **Mental Health Research Institute Annual Report, 1967.** Ann Arbor, Mich.: U. Michigan, Mental Health Research Inst., 1967. 87 p.

8669. ———. **WHO Expert Committee on Medical Rehabilitation: II. World Health Organization Technical Report Series**, 1969, No. 419, 23 p.—Stresses that "each victim of a disabling disease or accident needs to be treated, rehabilitated, and reinstated in society by the most favourable medical, social, educational, and vocational procedures." Various forms of rehabilitation are defined. The organization of medical rehabilitation services is examined. The legal, administrative, and financial aspects of such services, the establishment of specialist medical rehabilitation centers, and the relationship between rehabilitation and related services are discussed. The functions, education, and training of the various members of the rehabilitation team: specialists in rehabilitation medicine, nursing staff, physiotherapists, occupational therapists, prosthetists and orthotists, and speech therapists are reviewed.—*G. Steele*.

8670. Anderson, George C. (Academy of Religion &

Mental Health, New York, N.Y.) **Pastoral psychology: The next 20 years: In relation to mental health.** *Pastoral Psychology*, 1970(Feb), Vol. 21(201), 63-68.—Sweeping revolutionary changes in concepts concerning mental health and current problems in organized religion will bring about unforeseen implications in both psychiatry and pastoral psychology. Trends in religion may shape pastoral psychology as much as pastoral psychology may influence religion. Religion in cooperation with the new psychiatry may determine the major trends in the future of pastoral psychology.—O. Strunk.

8671. **Bey, Douglas R. & Smith, Walter E.** (Franklin Ave. Medical Center, Normal, Ill.) **Mental health technicians in Vietnam.** *Bulletin of the Menninger Clinic*, 1970(Nov), Vol. 34(6), 363-371.—Attempts "to describe the important work of paramedical personnel as members of a mental health team in a combat zone. The suggestion will be made that paramedical personnel might fill an equally significant role in civilian community mental health programs.... The Army has found that these paramedical specialists have been able to function effectively in a variety of mental health roles."—J. Z. Elias.

8672. **Castro, Gonzalo A.** **Perspectivas futuras en investigaciones socio-culturales aplicadas en salud mental.** [Future perspectives in socio-cultural investigations applied in mental health.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Mar), Vol. 16(1), 33-38.—Questions whether or not there is a difference between what is called "basic research" and "applied research," and exemplifies what could be called, "evaluative perspective." It is suggested that the future perspectives in "applied" sociocultural research in the mental health field should be of the evaluative type. (18 ref.)—English summary.

8673. **Colbach, Edward M. & Parrish, Matthew D.** **Army mental health activities in Vietnam: 1965-1970.** *Bulletin of the Menninger Clinic*, 1970(Nov), Vol. 34(6), 333-342.—Provides "an overview of U.S. Army mental health activities in the Vietnam combat zone from the escalation of mid-1965 to the significant de-escalation of mid-1970.... Despite the increased casualty rate in recent months, it is obvious that the American soldier in Vietnam has generally been psychologically healthier than his counterpart in previous wars." Psychiatric casualty statistics and treatment techniques are presented.—J. Z. Elias.

8674. **Gerdine, Marjorie W. & Bragg, Robert L.** (145 Lantern Ridge Rd., New Canaan, Conn.) **Referral patterns among mental health agents in three suburban communities.** *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 841-849.—Demonstrates differences among disciplines both in preferences for existing referral resources and in perceptions of most urgently needed future services. A total of 777 questionnaires were distributed to physicians, clergymen, nurses, and school personnel living or practicing in the 3 communities. 42% were returned. Information was elicited on: (a) where persons with emotional problems are referred, (b) the major obstacles in making referrals, and (c) the future needs in local mental health programs. There were significant differences among all of the major professional referral groups on all of the variables. The consideration of such attitudes is seen as fundamental in planning community-oriented programs.—*Journal abstract*.

8675. **Goldberg, Richard T.** **Rehabilitation research**

as a specialization. *Rehabilitation Literature*, 1969(Mar), Vol. 30(3), 66-70.—Demonstrates that rehabilitation research is a separate new branch of behavioral sciences "in that it presupposes a basic knowledge and sensitivity to the problems of adaptation to disability and handicap." The orientation of rehabilitation research is illustrated in a discussion of the questions to which it addresses itself. Limitations of research design are discussed, and the need for development of a rehabilitation theory is emphasized. (17 ref.)—G. Steele.

8676. **Harris, James R.** (U. Pennsylvania, Medical School) **Poverty, mental health, and the church.** *Pastoral Psychology*, 1969(Nov), Vol. 20(198), 45-48.—The community mental health movement can be an effective vehicle for all religious denominations in the country to become once more an integral part of the social mechanism for dealing with problems of poverty. Specific ways in which community mental health centers and the churches can unite their forces are mentioned.—O. Strunk.

8677. **Hunter, Harold R. & Katz, Alfred H.** (U. California, School of Public Health, Los Angeles) **Insurance for mental health care.** *Community Mental Health Journal*, 1970(Dec), Vol. 6(6), 464-469.—Reports that demand from employee groups, e.g., United Auto Workers, United Steel Workers, and the Federal Employees, as well as the increasing acceptance and availability of community mental health centers is leading to a sizeable increase in the populations covered by psychiatric insurance and the scope of services offered. This is true of commercial insurance companies and Blue Cross and Blue Shield plans. Whether this increase will greatly affect utilization, or out-of-pocket expenditures for psychiatric care, cannot be determined; however, the trend toward collective financing of psychiatric insurance under labor, employer, and other group auspices is clearly established.—*Journal abstract*.

8678. **Jorgensen, Gary Q., Janzen, Frederick V., Samuelson, Cecil O., & McPhee, William M.** (U. Utah) **Interpersonal relationships: Factors in job placement.** *Regional Rehabilitation Research Institute Bulletin, U. Utah*, 1968(Mar), No. 3, 101 p.

8679. **Kauff, Priscilla F.** (New York U.) **The relationship of the meaning of work, social competence, and social desirability to work behavior of the vocationally disabled mental patient.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1540.

8680. **Keith, Robert A.** (Claremont Coll.) **Physical rehabilitation: Is it ready for the revolution?** *Rehabilitation Literature*, 1969(Jun), Vol. 30(6), 170-173.—Examines parallels between the fields of mental health and physical rehabilitation concluding that "the rehabilitation center as presently constituted must be altered." It is suggested that social science methods be applied to rehabilitation environments, social organization and roles, and treatment methods. It is felt that the sick role model should be abandoned in favor of a more independent motivational model. Home environments, patient oriented facilities, task oriented therapy, and total environmental usage are proposed as alternatives to the present situation.—G. Steele.

8681. **Morrice, J. K.** (Ross Clinic, Aberdeen, Scotland) **The doctor's role and the needs of the community.** *Pastoral Psychology*, 1969(Dec), Vol. 20(199), 41-44.—Psychiatry is in the process of considerable change. Mental health workers are abandoning

their long preoccupation with the patient as an individual who has something wrong "inside" him. The new look asserts that men can learn to make healthier choices. But first a society which cares needs to be constructed, a task which is not only the concern of doctors and nurses, teachers and ministers, but of all mankind.—O. Strunk.

8682. Rubino, Agostino. (U. Palermo, Clinic for Nervous & Mental Diseases, Italy) *Igiene mentale dell'aggressività: Possibilità operative per la promozione e tutela della sanità mentale*. [Mental hygiene of aggressiveness: Operative possibility for the promotion and education of mental sanity.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1968(Sep), Vol. 29(5-6), 529-546.—Prevention and avoidance of aggressive behavior can be obtained by considering aggression in its natural settings: family, school, sexual education, and preparation for a productive use of leisure time.—L. L'Abate.

8683. Smith, Colin M. *Mental health developments in Saskatchewan*. *Canada's Mental Health*, 1970(Sep), Vol. 18(5), 15-20.—Reviews the changes in Saskatchewan mental health programs during 1960-69. The emphasis is on a community program with follow-up and outpatient care providing an alternative to institutional care. A new psychiatric plan is proposed which involves community involvement, coordination, participative management, regionalization, comprehensiveness, competition, feedback, and concern for people. The recruitment, retention, and training of qualified personnel is discussed. It is concluded that programs in childhood psychiatry, mental retardation, forensic psychiatry, alcoholism and nonmedical use of drugs, and services for the aged need to be more fully developed in order to supply complete mental health services for the region.—G. Steele.

8684. Wolfensberger, Wolf. (Nebraska Psychiatric Inst., Omaha) *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 291-297.—Discusses the "normalization principle" formulated by Scandinavian workers in mental retardation which aims at eliciting and maintaining culturally normative behavior and using culturally normative means to this end. The principle is simultaneously simple and comprehensive, and it can constitute a unifying ideology for all human management areas. It provides guidance for decisions from the lowest clinical to the highest systems levels. Some specific implications for psychiatry are discussed.—*Journal abstract*.

8685. Wright, G. N., Reagles, K. W., & Butler, A. J. (U. Wisconsin, Rehabilitation Research Inst.) *An expanded program of vocational rehabilitation: Methodology and description of client population*. *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1970, No. 11, 160 p.—Describes elements of the Wood County Project, a large-scale research and demonstration effort to examine the feasibility of and guidelines for expanding rehabilitation services to all handicapped people (see G. N. Wright, K. W. Reagles, and A. J. Butler, PA, Vol. 45:Issue 4). An overview of the methodology of the project includes a description of the experimental and control areas designated, the research design of the investigation, and the instruments used to assess the impact of rehabilitation services. The clients who were Ss are described in terms of selected pre-rehabilitation demographic variables and other information. The general characteristics common to all client

handicap subgroups in the project are listed. Characteristics differentiating the subgroups are also described in terms of sex, age, source of referral, marital status, onset of disability (time), automobile licensing and possession, employment status, highest grade completed, and educational achievement.—*Journal abstract*.

8686. Wright, George N., Reagles, Kenneth W., & Butler, Alfred J. *The Wood County Project: An expanded program of vocational rehabilitation*. Madison, Wis.: U. Wisconsin, Rehabilitation Research Inst., 1968.—Attempted "to assess the potential benefits of vertical and horizontal caseload expansion on rehabilitation clients, intra-agency processes, and the local community. Wood County, Wisconsin, was selected as the area for expansion; the principal control area was Eau Claire County, similar to Wood County demographically and geographically. The experimental agency was given sufficient staff and funds to expand vertically to serve all medically disabled persons eligible under existing criteria, and horizontally to serve the culturally disadvantaged. Sources of data were: (a) published research instruments, (b) unpublished instruments developed by... [the] staff, (c) quasi-objective community measurements, and (d) Wisconsin DVR [Division of Vocational Rehabilitation] client records. 5 client groups were compared: for Wood County, physically, mentally, and culturally handicapped; for Eau Claire County, physically and mentally handicapped. The client characteristics were organized in 3 sets of variables; demographic, vocational, ability." Results indicate that the "underlying thesis of the Project—established (traditional) techniques of state rehabilitation agencies can be effectively applied to a much broader range of unemployed and underemployed people—was found valid."—M. Maney.

8687. Zinberg, Norman. (Harvard U., Medical School, Boston, Mass.) *The mirage of mental health*. *British Journal of Sociology*, 1970(Sep), Vol. 21(3), 262-272.—Confusion of psychological illness with biological illness has partially resulted from the mistaken equation of psychological development (an augmented natural process that is in some important ways dependent on the choices made by the individual) with biological development. Notwithstanding this crucial difference between biological and psychological development, a medical model of mental illness should not be discarded entirely, since some mental disorders (such as schizophrenia) entail lack of participation in society that is comparable to severe physical sickness. The psychoanalyst's emphasis on the necessity to understand an individual's emotional disturbance leads to consideration of all things pertaining to the patient: biology, family, clan, culture, humanity. Any standard of mental health thus becomes individual and relational: dependent on culture, surroundings, and time of life. In this light human strength is seen as a process of individual adaptation to changing situations. Unfortunately this emphasis on flexibility runs counter to human desires for definition and certainty (e.g., contemporary American utopianism). But those in the helping professions must try to dissociate themselves from goals like perfect community health that they know to be excessive.—K. G. Shaver.

COUNSELING & GUIDANCE

8688. Ayer, M. J., Wright, G. N., & Butler, A. J. *Counselor orientation: Relationship with respon-*

sibilities and performance. *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1968, No. 10, 55 p.—Establishes the existence of relationships between a counselor's professional orientation—whether relationship, situation, bipolar, or neutral—and his attitudes toward selected professional responsibilities and development. Responsibilities include such areas as eligibility determination and employment placement, and development includes in- or outservice educational needs and service orientation and indoctrination procedures. The study also tested the relationship between counselor orientation and client case performance data (referral source, major disability, and reason for not being accepted for services). The research described validates a model developed to measure the professional orientation of rehabilitation counselors (see W. S. Sather, G. N. Wright, and A. J. Butler, PA, Vol. 45:Issue 4). A counselor with an "ideal" orientation, it was determined, would combine the characteristics of both the "relationship" and "situation" orientations, acknowledging the impact of the environment and external factors on his client's behavior as well as the importance of personal and internal factors and interpersonal relationships in shaping his client's behavior.—*Journal abstract*.

8689. Benningfield, Milo F. (Bethany Methodist Church, Houston, Tex.) **The time factor in multiple-interview counseling.** *Pastoral Psychology*, 1969(Jun), Vol. 20(195), 20-23.—For counseling situations in which more than 1 interview is called for, setting a time limit for the individual sessions generally makes for the most productive use of the minister's time and that of his counselee. Factors which interfere with this kind of responsible counseling include curiosity, escape from responsibilities, masochism, and an insatiable need to feel important.—*O. Strunk*.

8690. Buxbaum, Robert E. (San Antonio State Hosp., Tex.) **The unconscious: Your assistant minister.** *Pastoral Psychology*, 1969(Oct), Vol. 20(197), 49-54, 70.—Argues for the experience in psychoanalytic therapy as a necessity for pastoral counselors.—*O. Strunk*.

8691. Clinebell, Howard J. (Southern California School of Theology, Claremont) **Pastoral psychology: The next 20 years in pastoral counseling.** *Pastoral Psychology*, 1970(Feb), Vol. 21(201), 28-35.—Pastoral counseling will find its fuller usefulness when understood as a focused, life-releasing relationship. The future of this art will depend on the way pastoral counselors will be able to use the following unique aspects of pastoral counseling: (a) pastoral counseling is done in the matrix of a variety of complementary, life-enhancing function; (b) done in the undergirding context of pastoral care; (c) able to go to people and make help available without a formal invitation; (d) direct connection with a considerable number of interpersonal systems (marriage, families, groups, etc); (e) can be with people in many of the emotionally dangerous situations (birth, sickness, aging, etc.); (f) wealth of lay helping-potential at hand; (g) has major responsibility for education as well as counseling; (h) is identified as the leader of a group with a heritage of convictions, beliefs, and values; and (i) stands with a concern for the larger systems of society's structure.—*O. Strunk*.

8692. Dayringer, Richard. (Baptist Memorial Hosp., Kansas City, Mo.) **A learning-theory approach to pastoral counseling.** *Pastoral Psychology*, 1969(Mar), Vol. 20(192), 39-43.—Notes 8 factors to be used in selecting counselees. Once a counselee is selected, it is

necessary to know that the business of counseling is to correct the unacceptable mental and emotional habits the neurotic has learned. Pastoral counselors should keep abreast of the learning-theory approach to counseling.—*O. Strunk*.

8693. Friedman, Sam. (Youth Opportunity Center, Oakland, Calif.) **Role-playing in a youth employment office.** *Group Psychotherapy & Psychodrama*, 1970, Vol. 23(1-2), 21-26.—A group counseling program set up in a youth employment office to assist urban, minority, disadvantaged youth included role-playing techniques so that the youth would learn more about themselves and their potential employers. The effects on 6 of the youths are described.—*A. Krichev*.

8694. Lauver, Philip J., Kelley, Jan D., & Froehle, Thomas C. (Indiana U., School of Education) **Client reaction time and counselor verbal behavior in an interview setting.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 26-30.—Investigated the effects of 15-sec client response latencies on the speech and silence behavior of 4 experimentally naive graduate students who were counselor-trainees in advanced training. The coached client used the longer response latency during the middle 15-min period of the 45-min interview. Differences in counselor behavior across periods significant at or above the .05 level were noted for 1 speech and 2 silence variables. Results indicate that a coached client was able to effect change unobtrusively in the speech and silence behavior of counselors.—*Journal abstract*.

8695. Maes, Wayne R. (Ed.) **Counseling: A venture in human freedom.** *Bureau of Educational Research & Services Bulletin, Arizona State U*, 1968(Mar), No. 25, 61 p.

8696. Milliken, Robert L. & Kirchner, Regis. (DARTEC House, Meriden, Conn.) **Counselor's understanding of student's communication as a function of the counselor's perceptual defense.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 14-18.—Investigated the threat element of a counselee's verbal expressions on the counselor's recall in an experiment with 39 graduate students. Results show that more anxious counselors were less accurate in their ability to recall words spoken and feelings expressed in simulated interviews. Total objective test scores, obtained from the Institute for Personality and Ability Testing Anxiety Scale Questionnaire, combining results of 4 affective states (anxiety, anger, positive affection, and typical normal emotions), yielded statistically significant results. 2 discrete states, anger and minimal affect, showed impairment of recall of counseling data.—*Journal abstract*.

8697. Mitchell, Kenneth R. (U. New South Wales, Student Counseling & Research Unit, Sydney, Australia) **Shapiro's single case repeated-measure design applied to the individual client in counselling.** *Australian Psychologist*, 1969(Jul), Vol. 4(1), 20-36.—Attempted to determine the practicability of applying Shapiro's design in a counseling setting, and whether individual-centered research could produce results psychologically meaningful to either counseling practitioner or E. The design was applied to a male 1st-yr university student who had failed all his courses, but wished to continue his studies. Directive counseling was carried out over a 12-wk period, with 2 sessions/wk, in blocks of 2, through systematization of anxiety responses, and with supportive discussions of vocational goals. Results show

that: (a) directive counseling produced an over-all significant improvement, (b) no immediate effect of directive counseling was apparent, (c) the delayed effect of directive counseling was that of significant improvement, and (d) early counseling sessions produced more improvement than later sessions. Generalizations based on the results are: a directive counseling session sets in motion a delayed improvement process which lasts at least for several days, and a series of directive counseling sessions sets in motion a regular, delayed improvement process that does not reverse its direction as time goes on. Therefore, not only is it practicable to apply a single case repeated-measure design in a counseling setting, but a counseling experiment on a single case can produce results which are psychologically meaningful, useful to counseling practitioner and investigator.—*T. N. Webster.*

8698. **Wiksten, De Forrest.** *The power of pastoral counseling as the work of the Holy Spirit.* *Pastoral Psychology*, 1969(Oct), Vol. 20(197), 28-32, 40-42.—Discusses pastoral counseling in terms of man's longing for relatedness, the limitations of insight, and faith as the object of counseling. If the pastoral counselor is to maintain his balance and professional integrity, he needs to be in touch with the unassailable power of his calling and the immutable confidence of his pastoral practice.—*O. Strunk.*

Marriage & Family

8699. **Corsini, Raymond J.** (Family Education Center, Honolulu, Hawaii) *The elbow and feet technique.* *Individual Psychologist*, 1970(Nov), Vol. 7(2), 47-52.—Details the successful counseling of 1 family by the application of Adlerian concepts. The importance of how the counselor reacts to his own uncertainty is apparent.—*A. R. Howard.*

8700. **Kaufman, Philip K.** (Drug Abuse Committee, Queens County Medical Society, New York) *Marihuana: The watched pot.* *New York State Journal of Medicine*, 1970(Jul), Vol. 70(13), 1793-1798.—Presents a counseling case study which involved a 20-yr-old female, her parents, and their family doctor. Different viewpoints of those involved in the drug problem are discussed, stressing the different attitudes between generations with regard to marihuana.—*M. Maney.*

8701. **Scheinfeld, Daniel R., Bowles, Dorcas; Tuck, Samuel, & Gold, Reuven.** (Inst. for Juvenile Research, Chicago, Ill.) *Parents' values, family networks, and family development: Working with disadvantaged families.* *American Journal of Orthopsychiatry*, 1970(Apr), Vol. 40(3), 413-425.—Reports and evaluates a strategy for working with disadvantaged families whose preschool children are showing signs of slow development. Parents are 1st interviewed concerning their child-rearing values. A series of concrete activities commensurate with the parents' own value system are then introduced into family life. Through this process new kinds of exchanges develop within the family, and parents' ideas concerning child-rearing become more developmental. Parents are then enlisted to help develop other families within their social network. The open-ended interview schedule is included.—*Journal abstract.*

8706. **Ludwig, Edward G. & Collette, John.** (State University Coll. New York, Fredonia) *Disability, dependency, and conjugal roles.* *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 736-739.—Compared 2 groups of disability applicants and their wives, 1 in which applicants were dependent on their wives in activities of daily living and 1 in which they were not, to examine the effects of dependency on conjugal roles, household decision-making, and interaction with friends and relatives. Data indicate that (a) dependent husbands and their spouses spent more time together and less time with friends and relatives, and (b) dependent husbands were less likely to be involved in decision-making and more likely to reflect conjugal role flexibility.—*Journal abstract.*

8707. **Pekny, Lisolette.** (U. Innsbruck, Children's Clinic, Austria) *Die Rolle des Spiels beim bewegungsbehinderten Kind.* [The role of play activities in the mobility-handicapped child.] *Heilpädagogische Werkblätter*, 1970(Sep), Vol. 39(5), 241-247.—Examines the question of how far the behavior of the mobility-handicapped child can be positively modified through play activities, and what role can be ascribed to such play. Special problems and difficulties for such children are discussed, and therapeutic principles for them are presented.—*R. F. Wagner.*

8708. **Shontz, Franklin C.** (U. Kansas) *Physical disability and personality: Theory and recent research.* *Psychological Aspects of Disability*, 1970(Jul), Vol. 17(2), 51-69.—Agrees with previous studies of the literature that there is no evidence to support the hypotheses that many forms of somatic disability are associated with particular forms of personality or that the extent of the psychological effects of disability are proportional to the severity of the disability. Theoretical alternatives are available, but are infrequently applied in research. Basic personality structure appears to be stable even when somatic change is severe. Absence of anxiety is usually interpreted as evidence of denial, but it may be a sign of good and realistic adjustment in many cases.

Negative emotional experiences are associated with improvement in somatic status as well as with the onset of disability or disease; the crucial factor seems to be change in an enduring somatic state, rather than illness or health. (8 p. ref.)—*Journal abstract.*

8709. Uhlig, George E., Trotter, Ann B., Gozali, Joav, & Tesch, Mary J. (U. Wisconsin, Milwaukee) **Self-actualization in hospitalized disabled and non-hospitalized adults as measured by the Personal Orientation Inventory.** *Psychological Aspects of Disability*, 1970(Jul), Vol. 17(2), 83-85.—Compared groups of 30 physically disabled and 60 nondisabled male veterans to determine if physical disability affected perceived self-actualization as measured by Shostrom's Personal Orientation Inventory (POI). Hospitalized disabled; temporarily disabled and hospitalized; and nondisabled, nonhospitalized veterans did not differ significantly on any of the POI scales. The theoretical assumption that physical disability hampers growth toward self-actualization was not supported.—*Journal abstract.*

Blindness & Visual Disorder

8710. Feinsod, M., Rowe, H., & Auerbach, E. (Hebrew U., Hadassah Medical School, Jerusalem, Israel) [The diagnostic and prognostic value of electrophysiological examinations of the visual system.] *Harefuah*, 1970(Sep), Vol. 79(6), 249-251.—Reports 5 cases which demonstrate the clinical value of the combined examination of the electroretinogram and the average visual evoked potential of the visual cortex in the differential diagnosis of visual disturbances. The combined examination is especially valuable when the patient is uncooperative because of age, intelligence, state of consciousness, or malingering. The 1st patient was thought to be suffering from hysterical amblyopia and the 2nd to be a malingerer. However, the electrophysiological test showed both to have organic disturbances. The other 2 patients were referred with the diagnoses of retinitis pigmentosa and of traumatic lesion of the optic nerve, respectively. The normal findings of the electrophysiological tests in these 2 patients were essential in reaching a final diagnosis of psychiatric disturbance. The 5th patient suffered from severe cerebral damage, especially to the occipital lobes. Despite the fact that the examinations were carried out during a 6-wk period of unconsciousness, the electrophysiological tests indicated that it was likely that the patient would be able to see, which proved correct after the patient regained consciousness.—*English abstract.*

Deafness & Hearing Disorder

8718. Ewertsen, H. W., Nielsen, H. Birk, & Nielsen, S. Scott. (Bispebjerg Hosp., Copenhagen, Denmark) **Audio-visual speech perception: A preliminary report.** *Acta Oto-Laryngologica*, 1969(Jun), Suppl. 263, 229-230.—Varied independently 2 parameters (picture and sound level) by means of a video-recorder connected to a speech audiometer and a television set. The communication score of 100 hearing disordered patients was found in relation to the visual perception, to the auditive perception, and to a combination of both. In Ss with medium lipreading ability, there was a fairly good correlation between this ability and the reduction of their hearing loss measured in decibels. A small group seemed to have a special capacity of combining vision and hearing.—*Journal abstract.*

8719. Kearney, Jacqueline E. (U. Queensland, Brisbane, Australia) **Verbalization tests.** *Australian Psychologist*, 1970(Jul), Vol. 5(2), 164-176.—Discusses the extent to which the lack of speech facility limits the availability of "internal language" and handicaps deaf children in their capacity for concept formation. An experiment using a variation of 1 of the Queensland Test item types to investigate the use of such language in a small sample of deaf Ss is reported. Ss were 15 deaf 8 yr. olds. Indications on this limited sample are that internal language is in fact used and that mastery of such language facilitates problem solving.—*Journal abstract.*

8720. Osborne, J. Grayson. (Utah State U.) **Behavior modification with a deaf student: A case study.** *Psychological Aspects of Disability*, 1970(Jul), Vol. 17(2), 71-78.—Illustrates the usefulness of operant conditioning for behavior modification with deaf youth even when total classroom or dormitory control is not possible, and long delays between responses and reinforcement are necessary. A 15-yr-old deaf student was the S for a behavior modification experiment. The experimental task was to increase the frequency of

certain desirable responses, and to decrease the frequency of a class of undesirable responses through earning and forfeiting points. Points were totaled once daily, and every Friday the S was allowed to choose activities for the weekend based on the number of points earned during the wk. Results show significant changes in the desired directions in those response classes most heavily weighted with points. The amount of academic work increased significantly while undesirable behavior significantly decreased. Those responses producing the fewest points showed no systematic changes.—*Journal abstract.*

SPEECH DISORDER

8722. Edgren, B., Leanderson, R., & Levi, L. (Royal Caroline Inst., Lab. for Clinical Stress Research, Stockholm, Sweden) **A research programme on stuttering and stress.** *Acta Oto-Laryngologica*, 1969(Jun), Suppl. 263, 113-118.—Describes a series of experimental stressor exposures in which groups of stutterers (N = 49) had to expose their speech disturbance in public. Ss' self-rated emotional reactions were compared with their sympatho-adrenomedullary stress reactions, as reflected by urinary excretion of catecholamines. The effect of iteration of the experimental situation and the influence of psychotropic drugs were also studied.—*Journal abstract.*

8723. Gutiérrez Gómez, Diego. (Psychiatric Hosp. of the King, Madrid, Spain) **Interpretación de la ausencia del lenguaje en psiquiatría infantil.** [Interpretation of the language absence in infantile psychiatry.] *Archivos de Neurobiología*, 1969(Jan), Vol. 32(1), 51-64.—Classifies speech defects in children into 3 primary groups: (a) physical defects (motor or sensory), (b) symbolization difficulty (comprehension or verbal expression), and (c) arrangement difficulty (intellectual, emotional, or psychotic). Illustrative case histories are presented for each type in an attempt to delineate areas of difficulty in diagnostic procedures. Cases which pose the greatest difficulties involve deaf mutes. 4 cases are presented which illustrate children having normal IQs who were mistaken by both parents and physicians as being psychotic. Suggestions are offered for means of making more accurate diagnoses. (French summary)—*English summary.*

8724. Lecours, A. R. & Lhermitte, F. (Hôpital de la Salpêtrière, Paris, France) **Phonemic paraphasias: Linguistic structures and tentative hypotheses.** *Cortex*, 1969(Sep), Vol. 5(3), 193-228.—"Normal and aphasic language segments have been described as clusters of strings of units the less complex of which participate in the structuration of the more complex ones, thus realizing a system of several hierarchized levels of integration. A procedure for analysis of phonemic transformations has been outlined: it includes a method for quantifying similarity and proximity relations between phonemes participating in the structuration of a more complex segment; and a description of transformations by reference to a mathematical model. It has been shown that the sensitivity of a given phoneme to aphasic transformation is a direct

function of the degree of its similarity to other phonemes appearing in its immediate vicinity. Hypothetical considerations have been discussed concerning the physiological mechanisms subserving normal and abnormal production of phonemic sequences. It has been suggested that simulation experiments might lead to better understanding of the physiopathology of phonemic jargon aphasia."—*R. Gunter.*

8725. Lyapidevskii, S. S. & Seliverstov, V. I. (Eds.) **Vospitanie i obuchenie detei s rasstroistvami rechli.** [Training and teaching children with speech disorders.] Moscow, USSR: Prosveshchenie, 1968. 248 p.—Presents a collection of 9 articles, projecting a "complex of therapeutico-pedagogical measures," directed toward overcoming severe speech disorders in preschool children.—*I. D. London.*

8726. Mann, Mary B. & Chubrich, Ronda C. (State U. New York, Buffalo) **Binaural stimulation of aphasic patients: Effects on oral reading.** *New York State Journal of Medicine*, 1970(Nov), Vol. 70(22), 2815-2817.—Investigated H. G. Birch's findings that auditory stimulation decisively improves the verbal performance of aphasics. 18 predominantly expressive aphasics were tested under 3 rotated conditions: no auditory stimulation, white noise, and pure tone. Ss read aloud 3 sets of reading materials composed of lists of 10 words from 1-3 syllables long and 7 sentences from 3-16 words long. The differences in the 3 conditions were not statistically significant, although 5 Ss who scored below 20% correct responses did improve, and 2 Ss showed qualitative improvements under the pure tone condition. The previous findings are not supported, but it is suggested that auditory stimulation may be of use with patients who have great difficulty with language.—*S. Knapp.*

8727. Ostwald, Peter F. (U. California, Medical School, Berkeley) **The psychiatrist and the patient who stutters.** *Journal of Nervous & Mental Disease*, 1970(Apr), Vol. 150(4), 317-324.—Discusses the practical clinical management of patients with severe and persistent speech fluency disturbances called stuttering. The fundamental causes of this symptomatic disorder are not known. There is evidence for constitutional and maturational factors, but little support for any specific epileptogenic or psychogenic etiology. The disorder is more frequent among males, and if it persists past adolescence, patients may withdraw from social contacts or make undesirable personal adjustments requiring psychiatric attention. Symptom reduction often is best accomplished by speech therapists. If psychotherapy is attempted, the focus should be on immediate breakdowns in behavior, similar to brief psychotic crises, in which infantile and preverbal processes are exposed. The primary goal of any therapy is to reduce the fear of stuttering. Group therapy helps with the stutterer's dependency, rigidity, and megalomaniac defenses, especially in the sphere of speech behavior. There is no "cure" for stuttering, only a gradual shift in the direction of better rhythm, greater expressiveness, less redundancy, and calmer pausing in speech. (24 ref.)—*Journal abstract.*

NEUROLOGICAL DISORDER

8730. Asch, Morton J. (Veterans Administration Hosp., Martinez, Calif.) **The psychologist in the spinal cord injury center.** *Psychological Aspects of Disability*, 1970(Jul), Vol. 17(2), 79-82.—A questionnaire survey of 7 Veterans Administration Spinal Cord Injury Centers in 1969 indicated that the activities of psychologists have not changed significantly since a similar survey was completed in 1963 by M. J. Asch. Crucial patient problems, as perceived by psychologists, also changed little except for an increase in concern for vocational problems and a concomitant decrease in regular, gainful employment.—*Journal abstract.*

8731. Barbeau, Andre. (U. Montreal, Quebec, Canada) **Parkinson's disease: Recent advances in treatment.** *New York State Journal of Medicine*, 1970(Oct), Vol. 70(19), 2437-2443.—Summarizes rationale and results of research on Parkinson's disease. The observations of a low-dopamine content in the brain and urine of parkinsonian patients led to the use of the precursor L-dopa in therapeutic trials. Between 1961 and 1966, both oral and iv routes were utilized and some effects were noted on akinesia and rigidity. When higher oral doses of dopa were introduced in 1967, the sustained beneficial action of this drug on parkinsonian signs and symptoms was proved positively, but a number of troublesome side-effects were revealed, the worst of which were hypotension and a variety of abnormal involuntary movements. Results from 100 patients treated with an average daily oral dose of 4.8 gm. of L-dopa are presented, and new potentiators and future avenues of investigation are reviewed. (50 ref.)—*Journal summary.*

8732. Barlow, John S. (Massachusetts General Hosp., Boston) **Vestibular and non-dominant parietal lobe disorders: Two aspects of spatial disorientation in man.** *Diseases of the Nervous System*, 1970(Oct), Vol. 31(10), 667-673.—Considers 2 basic forms of spatial disorientation in man and discusses analogies to certain man-made navigational systems developed in recent years. Disorientation resulting from the vestibular organ, at the sensory receptor level, and the nondominant parietal lobe, at the central integrative level, are cited. Spatial orientation, following loss of vestibular functioning, is largely recovered, whereas in disease of the nondominant parietal lobe, recovery may be incomplete or totally lacking. These points are considered in relation to the normal and possibly abnormal functions of navigational systems which also possess "sensory-receptors" and "central integrative mechanisms" within their structures. Schematic diagrams and illustrative case history examples are provided. (15 ref.)—*P. McMillan.*

8733. Beck, Leah; MacKay, Mary, & Taylor, Reginald. (Columbia-Presbyterian Medical Center, Coll. of Physician & Surgeons) **Methylphenidate: Results on children's psychiatric service.** *New York State Journal of Medicine*, 1970(Dec), Vol. 70(23), 2897-2902.—Reports a double-blind experiment with methylphenidate (ritalin) to determine the site of action and the specific target symptoms. Case histories are presented for each of 8 inpatients, 8-12 yr. old with neurophysiologic immaturity and abnormal EEGs. Behavior and learning were evaluated by teachers and ward personnel; and

EEGs, WISC, Rorschach test, Bender-Gestalt Test, Goodenough Test, Raven Progressive Matrices, an adaptation of Piaget's stories, and neurologic tests for incoordination and cerebral dominance were administered. No untoward side effects were observed. 5 Ss showed substantial improvement in performance, and 4 Ss showed fewer EEG abnormalities. Findings suggest that methylphenidate has some effect on the bioelectric activity of the brain, and an organizing effect on behavior enabling Ss to respond to a hierarchy of stimuli. (15 ref.)—*S. Knapp.*

8734. Botez, M. I. (Prof. Dr. Gh. Marinescu State Hosp., Bucharest, Romania) **Aphasia: A multidisciplinary approach.** *European Neurology*, 1970, Vol. 3(1), 50-62.—Presents clinical observational data from 260 patients with surgically verified intracranial expanding processes and from 30 patients with cerebrovascular disease. A multidisciplinary approach is used to analyze and comment on the data from the neurophysiological, neurocybernetical, and psycholinguistic viewpoint. Topics dealt with include: (a) self-facilitation and facilitation as a temporal and spatial summation phenomenon, (b) the possibility of evaluating the liminal threshold of verbal communication in aphasics, (c) the importance of the starting point in carrying out verbal tasks, (d) the problem of discriminating the message as an auditory and cognitive event, (e) the mode of transmission of semantic information in aphasics, and (f) the role of noise in encoding and decoding of verbal messages. (16 ref.)—*Journal summary.*

8735. Crosby, Allan R. (11515 W. North Ave., Wauwatosa, Wis.) **The use of the Self-Rating Depression Scale after traumatic injuries.** *Journal of the American Osteopathic Association*, 1969(Nov), Vol. 69(3), 269-270.—Investigated psychological response to traumatic injury in 50 patients who had sustained acute trauma to the spinal and paraspinal structures. Ss were investigated during a 6-mo period using the Zung Self-Rating Depression Scale which provides a quantitative measurement of depression and a rapid method (5 min. for testing and scoring) for the assessment of depression. 40 Ss (80%) had scores above 43 (normal score = 24-43), while 70% of the Ss scored 50 or higher. A high score indicates depression of clinical significance. Results indicate that the frequency of depressive symptoms in patients with traumatic injury is high. It is concluded that aggressive, prompt treatment by the attending physician, or appropriate referral, should effect the best prognosis.—*Journal abstract.*

8737. Ettlinger, G. & Moffet, A. M. (Inst. of Psychiatry, London, England) **Learning in dysphasia.** *Neuropsychologia*, 1970(Nov), Vol. 8(4), 465-474.—Compared the performance of 27 dysphasic and 59 nondysphasic patients (many of whom had verified unilateral cerebral lesions) on tests of: sentence learning, sentence recall, rhythm learning, rhythm recall, word finding, and of nonverbal intelligence. In Exp. II, a small group of dysphasic Ss was taught to repeat a sequence of 5 names of objects (immediately after failing to name these 5 objects), and was then tested for the ability to name the objects which previously could not be named. It was found that the dysphasic Ss were significantly impaired at sentence learning, sentence recall, and word

finding, but showed only a trend towards impairment at rhythm learning and not even a trend at rhythm recall nor on the test of nonverbal intelligence. In Exp. II it was found that learning a sequence of object names facilitates, but generally does not ensure perfect performance at, object naming. Findings suggest that there might coexist 2 disabilities in dysphasia: verbal learning and verbal recall. (French & German summaries)—*Journal abstract*.

8738. Filatova, A. D. *Nekotorye osobennosti narusheniĭ motoriki i myshechnogo tonusa v zavisimosti ot strukturno-biologicheskikh svoĭstv neĭroektodermal'nykh opukholei visochnoi doli*. [Some features in disturbances of motor behavior and muscular tonus as a function of the structuro-biological properties of neuroectodermal tumors of the temporal lobe.] *Problemy Neirokhirurgii*, 1969, No. 2, 118-124. —Presents a clinico-EMG study of 82 cases, showing that in benign neuroectodermal tumors of the temporal lobe, disturbances of motor behavior and muscular tonus are chiefly subclinical in the early period and are disclosed only through the EMG. Later, a clinically expressed motor pathology ensues, as a result of the involvement of adjacent structures in the pathological process.—I. D. London.

8739. Fot, K., Richard, J., Tissot, R., & De Ajuriaguerra, J. (Bel-Air U., Psychiatric Clinic, Geneva, Switzerland) *Le phénomène de l'extinction dans la double stimulation tactile de la face et de la main chez les déments dégénératifs du grand âge*. [The phenomenon of extinction in the double tactile stimulation of the face and hand with degenerative dementia of old age.] *Neuropsychologia*, 1970(Nov), Vol. 8(4), 493-500. —Tested 35 patients with senile degenerative dementia with simultaneous tactile stimulation of the face and hand after they had responded correctly to a series of simultaneous stimuli of symetric body parts (both hands; both cheeks). Results show that the extinction phenomenon described by others in young children, in hemiplegics, and in demented patients, is part of the clinical pictures in degenerative dementia, appearing early in the process. The extinction phenomenon always occurs in the hand while facial stimulation is always perceived and correctly localized. It is slightly more frequent in homolateral stimulation (i.e., right hand-right cheek; left hand-left cheek) than in heterolateral stimulation (right hand-left cheek; left hand-right cheek). S's level of disintegration was measured with Piaget's operational tests and by determining digital autotopognosia. In the degenerative process, extinction appears slightly before troubles of digital autotopognosia while patients are still operating at a fairly high level on Piaget's operational scale (i.e., retaining the notion of conservation of weight or even the notion of conservation of volume. (German summary)—*English summary*.

8740. Golubenko, A. A. *Izmeneniya bioelektricheskoi aktivnosti pri neĭroektodermal'nykh opukholyakh tsentral'nykh izvilin i temennoi oblasti*. [Changes in bioelectrical activity in neuroectodermal tumors of the central gyrus and parietal region.] *Problemy Neirokhirurgii*, 1969, No. 2, 113-117. —41 of the 42 cases in the study exhibited changes in the EEG: (a) focal disorders of electrical activity most often in cases of benign tumor, and (b) widespread disorders in cases of malignant tumor.—I. D. London.

opment Center) *The Grassi Block Substitution Test for measuring organic brain pathology*. (2nd ed.) Springfield, Ill.: Charles C Thomas, 1970, vii, 84 p. \$6.50.

8742. Green, Eugene. (Veterans Administration Hosp., Aphasia Research Center, Boston, Mass.) *On the contribution of studies in aphasia to psycholinguistics*. *Cortex*, 1970(Jun), Vol. 6(2), 216-235. —Outlines "perspectives, models, and evidence that research in linguistic breakdown brings to bear both on the nature of aphasia and speech behavior as a whole. 4 aspects of speech behavior are considered: spontaneous speech, naming, repetition, and comprehension. Howes's model for spontaneous speech is reviewed for its power to explain mechanisms of speech production and some suggestions are made for further research. A 5 stage model of naming is discussed, including (a) a metalinguistic stage; (b) a stage for matching sensory information to words; (c) a linguistic stage; (d) a stage for the neurally coded representations of a word; and (e) a stage for processing abstract forms in their phonic shapes. Some of the research completed and still needed in repetition and comprehension is noted. The study, in all, argues for limited models of speech processes that incorporate the perspectives and findings of research in anatomy, linguistics and psychology."—R. Gunter.

8743. Guba, G. P. *Nevrologicheskie simptomy, sindromy i funktsional'nye proby*. [Neurological symptoms, syndromes and functional tests.] Kiev, USSR: Zdorov'ya, 1969. 300 p. —A manual with alphabetical listings. Included is a short dictionary of clinical neurological terms.—I. D. London.

8744. Gubler, E. V. (Ed.) *Problemy vychislitel'noi diagnostiki*. [Problems in computer diagnostics.] Leningrad, USSR: Nauka, 1969. 192 p. —Presents a collection of 21 articles on automation of the diagnostic process, employing the principles of "medical cybernetics." Articles on the diagnosis of cerebral vascular diseases, neurological pathologies, and closed craniocerebral injuries are included. The collection constitutes an unnumbered issue of *Problemy Biologicheskoi Kibernetiki* [Problems of Biological Cybernetics].—I. D. London.

8745. Kanyuka, Yu. I. *Sravnitel'naya kharakteristika dvigatel'noi i rechevoi patologii pri dobrokachestvennykh i zlokachestvennykh neĭroektodermal'nykh opukholyakh supratentorial'noi lokalizatsii*. [Comparative characteristics of motor and speech pathology in benign and malignant neuroectodermal tumors located in the supratentorium.] *Problemy Neirokhirurgii*, 1969, No. 2, 102-107. —Presents a comparative study of motor and speech pathology in 153 cases of astrocyt- and glioblastomata in the frontal, parietal, and temporal regions. The degree of malignancy is shown to have a definite influence on the appearance, frequency, and intensity of motor and speech symptoms.—I. D. London.

8746. Khomitskaya, L. F. & Stanislavskii, B. G. *Funktsional'noe sostoyanie gipotalamo-gipofizarno-nadpochechnikovogo kompleksa pri neĭroektodermal'nykh opukholyakh polusharii mozga razlichnoi stepeni zlokachestvennosti*. [Functional state of the hypothalamo-hypophyseal-adrenal complex in neuroectodermal tumors of the cerebral hemispheres with different degrees of malignancy.] *Problemy Neirokhirurgii*, 1969, No. 2, 140-145. —Data on the diurnal excretion of 17-oxycorticosteroids in the urine and on their concentration in the blood disclose a connection between degree of malignancy of glial tumors

in the cerebral hemispheres and the functions of the various links of the hypothalamo-hypophyseal-adrenal complex. However, in typical astrocytomata the functions of this complex are unaffected.—*I. D. London.*

8747. Klebanova, L. B. (Bogomolets Inst. of Physiology, Kiev, USSR) **Soderzhanie katekholaminov (adrenalina i noradrenalina) v sutochnoi moche pri porazhenii gipotalamusa.** [Catecholamine content (adrenaline and noradrenaline) in diurnal urine with lesion of the hypothalamus.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 141-145.—Observed 51 25-40 yr. old patients with hypo- and hypertonia caused by hypothalamic lesions. A high level of urine catecholamines in the case of the hypertonic syndrome (especially noradrenaline) attended an elevated tonus of the sympatho-adrenal system, and marked pressure reactions. In the case of the hypotonic syndrome, on the contrary, a low level of noradrenaline attended a decline of sympatho-adrenal tonus and arterial hypotension.—*I. D. London.*

8748. Lauta, A. D. (Bogomolets Inst. of Physiology, Kiev, USSR) **K kharakteristike obmenno-endokrinnykh narushenii pri porazhenii gipotalamusa.** [On the characteristics of the metabolic-endocrine disturbances following lesion of the hypothalamus.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 134-140.—Observed 53 20-40 yr. old diencephalic patients with metabolic-endocrine disturbances. Hypothalamic lesions may be attended by various forms of disturbed fat metabolism against a background of autonomic and viscerovascular disorders inherent in diencephalic syndromes.—*I. D. London.*

8749. Lit, A. C. (Christelijk Sanatorium for Neurosis & Psychosis, Zeist, Netherlands) **Man behind a mask: An analysis of the psychomotor phenomena of Parkinson's disease.** *Acta Neurologica et Psychiatrica Belgica*, 1968(Dec), Vol. 68(12), 863-874.—Presents a brief case history of a patient with Parkinson's disease and elaborates general results of a study of the psychiatric and psychological factors in 50 patients having Parkinson's disease. Correlations are demonstrated between the physiological symptoms in parkinsonian Ss (e.g., akinesia, tremor, and rigidity) and a very specific mental syndrome which appears to be prevalent. This syndrome is characteristically comprised of the following symptoms: (a) obsession with one's body, (b) mental rigidity, and (c) rejection of nearly all external stimuli (particularly those stimuli associated with motor functions). Findings are discussed in terms of the total personality involvement in Parkinson's disease. (French & German summaries) (15 ref.)—*P. R. Shibelski.*

8750. Makarchenko, A. F. & Dinaburg, A. D. (Bogomolets Inst. of Physiology, Kiev, USSR) **Rol' gipotalamusa v kardiovaskulyarnom i respiratornom kontrole u cheloveka.** [Role of the hypothalamus in human cardiovascular and respiratory regulation.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 49-57.—Ss were 240 diencephalic patients with hypo- and hypertonic syndromes (170 and 70, respectively). It is shown that: (a) patients suffering from viscerovascular diencephalic syndromes exhibit dysfunction in certain aspects of cardiovascular and respiratory functions; and (b) on the basis of the data procured in studying these syndromes, the hypothalamus is very much involved in the maintenance of vascular tonus and vascular reactivity to unconditioned and conditioned stimulation, the trophicity of the heart muscle, and the tonus of the

respiratory center in the medulla oblongata (at a certain level and with correctness of respiratory rhythm).—*I. D. London.*

8751. Mark, Vernon H. & Ervin, Frank R. (Boston City Hosp., Mass.) **Violence and the brain.** New York, N.Y.: Harper & Row, 1970. xiv, 170 p. \$6.95.

8752. Milyutina, E. V. (Bogomolets Inst. of Physiology, Kiev, USSR) **Funktsional'naya aktivnost' zhenskikh polovykh zhelez pri porazheniyakh gipotalamusa.** [Functional activity of the female sex glands with lesions of the hypothalamus.] *Problemy Fiziologii Gipotalamusa*, 1969, No. 3, 146-150.—Observed 80 15-45 yr. old women with diencephalic syndromes. In the case of the hypertonic viscerovascular diencephalic syndrome, the 1st phase of the menstrual cycle was disturbed. In the case of the hypotonic viscerovascular diencephalic syndrome, disorders in both the 1st and the 2nd phases of the cycle were observed. In the case of the neuroendocrine syndrome, considerable elevation of estrogen excretion was observed over the space of the whole cycle.—*I. D. London.*

8753. Mones, Robert J. (Mt. Sinai Medical School, New York, N.Y.) **Parkinson's disease: I.** *New York State Journal of Medicine*, 1970(Nov), Vol. 70(21), 2687-2691.—Reviews medical progress in work with Parkinson's disease from the time of its discovery in 1817 until the present, discusses epidemiology of the disease, and presents descriptive information from 1926 to the present. (31 ref.)

8754. Mones, Robert J. (Mt. Sinai, Medical School, New York, N.Y.) **Parkinson's disease: II.** *New York State Journal of Medicine*, 1970(Nov), Vol. 70(22), 2822-2828.—Presents an extension of a study by R. J. Mones (see PA, Vol. 45:Issue 5) reviewing the history and treatment of Parkinson's disease. The history of drug treatment from scopolamine in 1892 to L-dopa at the present is reviewed. Surgical procedures are examined and evaluated. It is concluded that the use of L-dopa and the approach to Parkinson's disease as a neurochemical transmitter disease constitute major breakthroughs and are also promising for research into other diseases of the nervous system. (43 ref.)—*S. Knapp.*

8755. Mones, Robert J., Elizan, Teresita S., & Siegel, George J. (Mt. Sinai School of Medicine, City U. New York) **Evaluation of L-dopa therapy in Parkinson's disease.** *New York State Journal of Medicine*, 1970(Sep), Vol. 70(18), 2309-2318.—Presents an analysis of 152 patients with Parkinson's disease who were treated with L-dopa therapy for 2-9 mo. Results show that about 50% of the Ss had to change their style of living and were considered to have successful results from L-dopa trials. An explanation for failure with the other 50% was not evident. It is concluded that patients with Parkinson's disease should be treated with L-dopa unless there is severe, life-threatening cardiovascular or cerebral vascular disease. It is noted that data is in agreement with previously obtained data in studies of the effects of the drug and complications on a short-term basis of from 1-2 yr. The need for close follow-up reporting of long-term L-dopa therapy is emphasized. (19 ref.)—*Journal summary.*

8756. Nicol, Charles F. (State U. New York, Medical School, Buffalo) **Treatment of reversible dementia.** *New York State Journal of Medicine*, 1970(Oct), Vol. 70(19), 2432-2437.—Briefly discusses some of the more common causes of reversible dementia, presents the pertinent facts of normal pressure-communicating

hydrocephalus, and illustrates some aspects of this disorder with a short case report of a 54-yr-old male. It is stressed that this last disorder may be easily missed since it may follow long-forgotten trauma, bleeding, or even result when no causative agent can be found. It is of utmost importance that the ventricular system of such patients be shunted before the patient is confined to a long-care institution. (26 ref.)—*Journal summary.*

8757. Parisi, Domenico & Pizzamiglio, Luigi. (National Research Council, Rome, Italy) **Syntactic comprehension in aphasia.** *Cortex*, 1970(Jun), Vol. 6(2), 204-215.—Presents "a test for measuring the syntactic comprehension in aphasic patients: some of its psychometric characteristics and its clinical usefulness are discussed. By using this test the performances in verbal comprehension of Broca's and Wernicke's aphasics are compared: although the 2 groups give different quantitative results, almost no qualitative differences are found between them. The data obtained by the aphasics are also compared with the results of groups of children 3 to 6 yr. of age: the dissolution of syntactic comprehension in aphasics is highly correlated with the order of acquisition of the same rules in children."—*R. Gunter.*

8758. Pen'kovoĭ, K. I. & Nemchenok, M. A. **O dinamike ėpilepticheskikh pripadkov u bol'nykh s neiroektodermal'nyimi opukholyami polushariĭ golovnogo mozga razlichnoi stepeni zlokachestvennosti.** [On the dynamics of epileptic seizures in cases of neuroectodermal tumors of the cerebral hemispheres with different degrees of malignancy.] *Problemy Neirokhirurgii*, 1969, No. 2, 63-66.—Operative intervention, even in the form of decompressive trepanation, leads in half the cases to the disappearance or diminution of the frequency of epileptic seizures. While surgical intervention can lead to the temporary disappearance of the epileptic syndrome in cases of malignant tumors, in some cases it brings on an increase in the frequency of seizures and an acute change in their structure.—*I. D. London.*

8759. Razumovskaya-Molukalo, L. P. **Sravnitel'naya kharakteristika nekotorykh form psikhicheskoi patologii v dinamike techeniya dobrokachestvennykh i zlokachestvennykh opuklolei golovnogo mozga.** [Comparative characteristics of some forms of psychic pathology in the developmental course of benign and malignant tumors of the brain.] *Problemy Neirokhirurgii*, 1969, No. 2, 92-95.—Reports results of clinical and psychological studies, in which it is seen that the observed features, characterizing the pathology of consciousness, thinking, memory, and the "emotional sphere," are a function of the histobiological properties of the tumor and the phase of the pathology. The factors, shaping psychic disorders and determining their character, are established. The possibility of complete regress of psychic pathology after the successful removal even of malignant tumors of the brain is established.—*I. D. London.*

8760. Scollo-Lavizzari, G. (U. Basel, Neurological Inst., Switzerland) **The effect of sleep on electroencephalographic abnormalities at a distance from the lesion: An all-night study of 30 cases.** *European Neurology*, 1970, Vol. 3(2), 65-87.—Studied rhythmic slow activity, frontal and occipital intermittent rhythmic distance activity (FIRDA, OIRDA), during all-night sleep in 30 patients with a wide range of clinical diagnoses. The influences of slow and REM sleep on FIRDA and OIRDA were also investigated. FIRDA and OIRDA showed marked reactivity: they sometimes were

activated during drowsiness and disappeared in slow sleep. During REM, FIRDA was present and sometimes accentuated, while OIRDA was absent. Possible neurophysiological mechanisms of the origin of these EEG patterns are discussed. It is suggested that FIRDA and OIRDA do not utilize similar anatomical systems and possibly have a different pathological significance. (26 ref.)—*Journal summary.*

8761. Taleisnik, S. L. **O nekotorykh osobennostyakh neiroektodermal'nykh opukholei polushariĭ golovnogo mozga u lits starshe 50 let.** [On some features of neuroectodermal tumors of the cerebral hemispheres in people over 50 years of age.] *Problemy Neirokhirurgii*, 1969, No. 2, 73-78.—Presents a study based on an analysis of verified gliomata of the cerebral hemispheres: glioblastomata (54), atypical astrocytomata (1), and atypical oligodendrogliomata. Premorbid changes in the brain include acute disorders of the psyche. 6 different types of predominating symptomatology in the beginning of the pathology are discerned: blastomatose, psychopathological, vascular, traumatic, inflammatory, and epileptic.—*I. D. London.*

8762. Taranskaya, A. D. **K kharakteristike rasstroistva soznaniya pri opukholyakh golovnogo mozga.** [On the characteristics of disordered consciousness in cerebral tumors.] *Problemy Neirokhirurgii*, 1969, No. 2, 96-101.—The following types of disordered consciousness were observed in 200 cases of cerebral tumor: unresponsive, oneiroid, oneiroid-delirious, and delirious. The 1st type was observed only in benign tumors. The changes, observed in higher nervous activity, were connected with the narcotic phase of incomplete inhibition, as a result of the blockade of stimuli which are the stimulators of the alert state in the cortex. The amentive type of disordered consciousness was most often encountered in multiform spongioblastomata. Changes, observed in higher nervous activity, are connected with decline of strength of the excitatory process and with the severance of interactions between the "2 [Pavlovian] signal systems."—*I. D. London.*

Brain Damage

8763. Ben-Yishay, Yehuda; Diller, Leonard, & Mandelberg, Ian. (New York U. Medical Center, Inst. of Rehabilitation Medicine) **Ability to profit from cues as a function of initial competence in normal and brain-injured adults: A replication of previous findings.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 378-379.—Cross-validated previously reported findings by Y. Ben-Yishay, L. Diller, L. Gerstman, and W. Gordon (see PA, Vol. 44:15125) which suggest that improvement in block design (BD) performance of left hemiplegics as a function of cuing is lawful and quantifiable. To test whether this is generalizable to normals and right hemiplegics as well, 40 normals, 56 left hemiplegics, and 49 right hemiplegics performed the BD task under standard and special cuing conditions. Results uphold the previous findings.—*Journal abstract.*

8764. Blagoveshchenskaya, N. S. **Ėlektro-nistagmografiya pri ochagovykh porazheniyakh golovnogo mozga.** [Electro-nistagmography in focal lesions of the brain.] Moscow, USSR: Meditsina, 1968. 168 p.—Presents a monograph based on the literature and the author's own research. It deals with: (a) current

methods of recording the fine movements of the eyeball; (b) the interaction of the vestibular with other analyzers, the visual in particular; (c) new data on the interconnection and interdependence of brainstem vestibular reactions, optokinetic nystagmus, and the functional state of the cerebral cortex both in the normal state and in pathology; and (d) the utilization of electro-nystagmographs in the clinicopathology of focal cerebral lesions.—*I. S. **Teste de Bender, Teste metropolitano de prontidão e E.E.C: Suas relações em um grupo de crianças de 6 a 8 anos de idade.** [Bender Test, Metropolitan Achievement Test and EEG.: Their relationship in a group of 6 and 8 year old children.] *Revista de Psicologia Normal e Patológica*, 1969(Jan), Vol. 15(1-2), 94-110.—Tested 44 6-8 yr. old children in order to investigate a correlation between EEG and Bender Gestalt Test results in the diagnosis of cerebral lesion as defined by E. M. Koppitz. No correlation was found, although the Ss showed a high incidence of cerebral lesion. An association was found between results on the Bender Gestalt Test and on the Metropolitan Achievement Test. It is concluded that no relationship exists between EEG alterations and the appearance of alphabetization difficulties. (English summary)—*P. Hertzberg.*

8766. De Renzi, E., Faglioni, P., & Scotti, G. (U. Milan, Clinic of Nervous & Mental Disease, Italy) **Hemispheric contribution to exploration of space through the visual and tactile modality.** *Cortex*, 1970(Jun), Vol. 6(2), 191-203.—"Control and unilaterally brain-damaged patients were given 2 tests requiring the exploration of space through the visual and the tactile modalities. On the visual test, controls performed better when the item was on the left side than when it was on the right. This 'normal' left-right gradient (probably due to reading habits) was found to be significantly increased in left brain-damaged patients and reversed in right brain-damaged patients, a finding which supports the assumption that injury to 1 hemisphere mainly impairs the exploration of the contralateral field. On the tactile test, each hemispheric group performed worse in the contralateral field. This lengthening of the searching time cannot be explained by disruption of the sensorimotor mechanism subserving space exploration and points to the impairment of a higher level ability, identifiable as the representation of contralateral space. When performance was scored in terms of failure in finding the marble within the 90 sec time limit, right hemisphere patients with visual field defects turned out to be significantly more impaired than any other brain-damaged subgroup. This finding is suggestive for the occurrence of unilateral neglect also in the tactile modality and it lends support to the hypothesis that hemi-inattention does not depend so much on perceptual and motor factors as on a mutilated representation of space."—*R. Gunter.*

8767. Fox, Joseph P. (Indiana U.) **Exploration of relationships between each cerebral hemisphere and the comprehension of visual linguistic stimuli of various grammatical structures.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1584-1585.

8768. Konow, Audrey & Pribram, Karl H. (Stanford U., Medical School) **Error recognition and utilization produced by injury to the frontal cortex in man.** *Neuropsychologia*, 1970(Nov), Vol. 8(4), 489-491.—Re-

viewed a previous case of a patient with frontal lobe damage who was observed and was noted to suffer from "an equivocal disturbance of error evaluation." The terms error "evaluation" and "utilization" were employed synonymously. Neuropsychological examination of the patient is reported to clarify this "equivocal disturbance." It was found that error recognition remains intact although error utilization is disturbed. Consequently the nature of the frontal lobe syndrome is reevaluated. (French & German summaries)—*Journal abstract.*

8769. Levy, Jerre. (California Inst. of Technology) **Information processing and higher psychological functions in the disconnected hemispheres of human commissurotomy patients.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1542.

8770. Mark, Vernon H., Barry, Herbert; McLardy, Turner, & Ervin, Frank R. (Boston City Hosp., Neurosurgical Service, Mass.) **The destruction of both anterior thalamic nuclei in a patient with intractable agitated depression.** *Journal of Nervous & Mental Disease*, 1970(Apr), Vol. 150(4), 266-272.—Describes the case of a 57-yr-old female occupational therapist with chronic intractable agitated depression resistant to psychotherapy, pharmacological agents, and ECT. In spite of the mood elevation produced by anterior thalamic nucleus destructions, S's impulse control was insufficient to prevent a suicide. Anatomical sections of the S's brain showed almost complete obliteration of anterior ventral nucleus of the thalamus bilaterally.—*Journal summary.*

8771. Pope, Lillie. (Coney Island Hosp., Brooklyn, N.Y.) **Motor activity in brain-injured children.** *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 783-794.—Indicates that distinctions can be made between the hyperactivity and restlessness of minimally brain-injured children. While the total motor activity level of 19 7-11 yr. old brain-injured boys did not differ from that of 19 normal controls, their restlessness was significantly greater in 3 of 4 experimental situations: (a) undirected activity in a playroom, (b) performance of a difficult task, and (c) voluntary inhibition of activity. There were no significant differences in performance of a simple task. (15 ref.)—*Journal abstract.*

8772. 't Lam, R. L. **Verdere analyse van een cognitieve dimensie (F₂), factorieel en klinisch, dl. 1.** [Further analysis of a cognitive dimension (F₂): 1. Factorial and clinical.] *Gawein*, 1969(Oct), Vol. 18(1), 31-40.—By factor-analysis of a 13-variable matrix of tests, derived from a sample of brain-injured children, a factor was identified that seems to be related to Thurstone's I and E factors. Possible involvement of the dominant left cerebral hemisphere in this factor was indicated by high loading of the right-hand version of a factual performance test. The relevance of certain recent theories of the set phenomenon is indicated.—*English summary.*

8773. Tzavaras, A., Hécaen, H., & Le Bras, H. (St. Anne Neurosurgical Center, Paris, France) **Le problème de la spécificité du déficit de la reconnaissance du visage humain lors des lésions hémisphériques unilatérales.** [The problem of specificity of inadequate recognition of the human face after hemispheric unilateral lesions.] *Neuropsychologia*, 1970(Nov), Vol. 8(4), 403-416.—Presented a series of visual identification tests to 51 Ss with unilateral cortical lesions (25 left-sided, 26 right-sided) and to 30 controls. The test material

Epilepsy

included photographs and designs of human faces, meaningless line patterns, shadow patterns, and photographs of different objects in the same category. Results (a) confirm those of previous studies showing the predominant role of right hemispheric lesions in deficits of recognition of the human face, and (b) demonstrate this same predominance whether the faces were presented as photographs or as simple designs. No correlation was found between the results of the tests of facial recognition, taken as a group, and those of the tests of identification of similar objects, of meaningless patterns, and of shadow patterns representing a complex perceptive task, also taken as a group. Based on these results, a hypothesis of the existence of an autonomous defect of human facial recognition is discussed. (German summary) (20 ref.)—*English summary*.

8774. Warrington, Elizabeth K. & Rabin, P. (National Hosp., London, England) **Perceptual matching in patients with cerebral lesions.** *Neuropsychologia*, 1970(Nov), Vol. 8(4), 475-487.—Devised tasks of perceptual matching, including 3 types of visual stimulus (slope of line, position of dot, and size of gap in contour). 74 patients with unilateral cortical lesions were tested. The right parietal group was impaired on the perceptual matching tasks. There was no association between performance on perceptual matching tasks and tachistoscopic threshold measurements or a test of picture recognition. The relationship between perceptual matching and performance on other more complex visual tasks is discussed. (French & German summaries)—*Journal abstract*.

8775. Willner, Allen E. & Struve, Fred A. (Hillside Hosp., Glen Oaks, N.Y.) **An analogy test that predicts EEG abnormality: Use with hospitalized psychiatric patients.** *Archives of General Psychiatry*, 1970(Nov), Vol. 23(5), 428-437.—Investigated whether the Willner-Scheerer Analogy Test (WSA) could accurately predict EEG abnormality and normality in a psychiatric hospital population. Results of Exp. I indicate that a simple WSA cutoff score, predicted the EEG findings of 106 patients with highly significant accuracy. Exp. II replicated those findings with a further sample of 116 Ss. Subsequent data analyses indicate that the predictive accuracy of the WSA did not change when the sample was restricted to only those Ss who were drug-free at time of testing. These results suggest that the WSA, a simple paper-and-pencil test, may be useful in identification of minimal brain damage in psychiatric populations. Data also suggest that a substantial proportion of patients in psychiatric hospitals may have minimal brain damage. (25 ref.)—*Journal summary*.

8776. Yin, Robert K. (Massachusetts Inst. of Technology) **Face recognition by brain-injured patients: A dissociable ability?** *Neuropsychologia*, 1970(Nov), Vol. 8(4), 395-402.—Found that 11 patients with right posterior cerebral injuries did more poorly than 13 patients with other unilateral injuries and 12 normal control Ss in recognizing different faces. When the faces were presented upside-down, however, those with the other unilateral injuries did worse than the right posterior group and the normal controls. This dissociation between upright and inverted presentations was not found with pictures of another common object, houses of similar architecture. Results support the notion that, among the disorders caused by right posterior injuries, there does exist a material-specific deficit in recognizing faces. (French & German summaries) (20 ref.)—*Journal abstract*.

8777. Blumer, Dietrich. **Changes of sexual behavior related to temporal lobe disorders in man.** *Journal of Sex Research*, 1970(Aug), Vol. 6(3), 173-180.—Sexual changes of 49 temporal lobe epileptics were noted. The majority of the patients underwent unilateral temporal lobectomy. Findings show that the postoperative improvement in sexuality is significantly related to the success of surgery in eliminating the seizures. After unilateral temporal lobectomy for epilepsy and after bilateral temporal lobectomy, the paroxysms of irritability and of sexuality tend to be mutually exclusive in temporal lobe epilepsy. (19 ref.)—*E. B. Jaffa*.

8778. Cassarino, P., Falsaperla, A., & Papalia, G. (U. Catania, Clinic for Nervous & Mental Illness, Italy) **Modificazioni del quadro idrico globulare in soggetti affetti da "piccolo male" epilettico in seguito a trattamento con alfa-etil-alfa-metil-succinimide.** [Modifications of the globular water description in subjects having petit mal epilepsy as a consequence of treatment with alpha-ethyl-alpha-methyl-succinimide.] *Acta Neurologica*, 1969(May), Vol. 24(3), 416-430.—Presents a brief summary of the history of epilepsy, and refers to the etiopathogenetic aspect emphasizing water metabolism in this illness. Then the results of research carried out on a group of 6 patients suffering from petit mal seizures are reported. Using the method of P. Cristol and C. Benezech, the red globular water picture was ascertained under normal conditions and after 10 and 20 days of treatment with alpha-ethyl-alpha-methyl-succinimide which was given in fractionated doses from 500-1000 mg/day. Examination of results shows that the globular water picture in petit mal, under normal conditions, can be considered as intermediate between normal Ss and epileptics (grand mal). Treatment with alpha-ethyl-alpha-methyl-succinimide changes the globular water picture causing a decrease in the values of the total water content. It is concluded that this tendency of the values of the globular water picture to become normal is related to the effectiveness of the therapy. (44 ref.)—*English summary*.

8779. Di Perri, R., Dello, Ioio, G., & Supino, V. (U. Messina, Clinic for Nervous & Mental Illness, Italy) **"Sursaut" epilettico audiogeno clinicamente tipico correlato ad inconsuete, molteplici espressioni elettroencefalografiche.** ["Startle" epilepsy and audiogenic clinically typical correlates of numerous, unusual electroencephalographic patterns.] *Acta Neurologica*, 1969(May), Vol. 24(3), 431-444.—Describes a case of startle epilepsy in which the patient had typical tonic seizures induced by sudden auditory stimuli (startle epilepsy). Although the clinical crises were always of the same type, their EEG correlates were of 2 different varieties: (a) a diffuse flattening of cerebral electrical activity was followed by focal convulsive discharges in the left temporal region subsequently extending to all cortical areas and in an "oil spot" fashion, and (b) crisis accompanied by synchronous, generalized, high-voltage potentials beginning either simultaneously with the tonic seizure, or after an interval of time occupied by a diffuse flattening of the electrical activity. This duality of EEG critical patterns opposed to the uniformity of the motor phenomena is discussed in relation to the current pathogenetical interpretation of the acusticomotor epilepsy. (22 ref.)—*English summary*.

8780. Frantzen, Esther; Lennox-Buchthal, Margaret;

Nygaard, Anne, & Stene, Jon. (U. Copenhagen, Denmark) **A genetic study of febrile convulsions.** *Neurology*, 1970(Sep), Vol. 20(9), 909-917.—Attempted to define the mode of inheritance and the trait inherited, by analyzing the genetic data of 208 febrile convulsive children whose relevant family histories could be obtained, as well as complete information on all siblings and parents. Genetic findings were related to clinical and EEG findings: (a) The incidence of febrile convulsions was the same in parents and in sibs of the sample studied—9% or 3 times the prevalence in the population. (b) $\frac{1}{2}$ the affected relatives with epilepsy were distant. Rate of epilepsy in parents and sibs, uncles, aunts, and cousins was not higher than the prevalence in the population. (c) There was no evidence that some families might differ from others in the mode of transmission nor that some cases were nongenetic. (d) There was clinical and EEG evidence of a different degree of expressivity in some families. (e) More than $\frac{1}{2}$ the probands with solely epilepsy in the family had severe or multiple natal or neonatal complications. (f) Recurrent spontaneous convulsions persisted in 3 children (1.4%) all severely brain-damaged, i.e., 1 had an intercurrent encephalitis, and 2 were mentally retarded.—*Journal summary.*

8781. Garcez de Sena, Plínio & Rizzo, Alfredo, O. (Federal U., Neurology Clinic, Bahia, Brazil) **Mandrix em epilepsia.** [Mandrix in epilepsy.] *O Hospital*(Dec), Vol. 76(6), 2047-2053.—Studied the evidence of noxious effects of mandrix on 17 male and 16 female epileptics, the majority being between 11 and 20 yr. old. Ss were given 1-2 tablets of mandrix/day for 45 days. EEGs were taken in the absence of anticonvulsive medication and before and after the application of the drug. It was found that mandrix had no effect on the intensification of epileptic crises and did not significantly change EEGs. No major side effects were noted.—*P. Hertzberg.*

8782. Geller, Martin & Geller, Anne. (Mt. Sinai Hosp. Services, City Hosp. Center, Elmhurst, N.Y.) **Brief amnesic effects of spike-wave discharges.** *Neurology*, 1970(Nov), Vol. 20(11), 1089-1095.—Those working with patients having petit mal seizures have observed that in addition to, or instead of, the usual clinical concomitants of staring, nodding, brief myoclonus, etc., these patients may demonstrate unusual psychiatric behavior, learning difficulties, inattentiveness, or apparent lapses of memory. 5 children with diagnoses of generalized epilepsy were examined for the effect of spike-wave discharges upon the ability to recall a visual stimulus. Recall was impaired when the discharge succeeded the presentation of the stimulus by up to 4 sec. Impairment of recall was found to be a function of both the time interval between presentation of the stimulus and the onset of the discharge and also of the length of the discharge itself.—*F. O. Triggs.*

8783. Horowitz, Mardi J., Cohen, Freda M., Skolnikoff, Alan Z., & Saunders, Frank A. (Mt. Zion Medical Center, San Francisco, Calif.) **Psychomotor epilepsy: Rehabilitation after surgical treatment.** *Journal of Nervous & Mental Disease*, 1970(Apr), Vol. 150(4), 273-290.—Medically uncontrollable temporal lobe epilepsy may be successfully treated by neurosurgical methods: temporal lobectomy may provide seizure relief for up to 80% of properly selected patients. Cognitive impairments present prior to surgery, however, usually remain and may even be worse after lobectomy. A new technique, localized brain lesions made by stereotactic implantation of depth electrodes, is described in a study of 29 17-52 yr. old patients. Results

indicate that this technique is less successful in providing seizure relief, but has less hazard and is followed by less decrement on psychometric measurements. Whatever the procedure, psychosocial rehabilitation does not automatically occur with seizure relief. Some patients develop substitute symptoms, and many have paranoid or depressive responses. Those who improve in psychosocial functioning rehabilitate slowly and with great personal effort. It is suggested that psychotherapy should be part of any neurosurgical treatment program for temporal lobe epilepsy for a minimum of 1 yr. after relief of symptoms. Turbulent upheaval is not uncommon in patients who have been relieved of seizures and is not necessarily a poor prognostic sign. The outcome of surgery cannot be judged until years after the event. A very depressed and dependent patient, free of seizures 1 yr. after lobectomy, may be functioning well and be reasonably contented 2 yr. later.

8784. Lison, Michel P. (U. São Paulo, Medical School, Brazil) **Ausências mioclônicas: Estudo comparativo da potência anticonvulsivante do nitrazepam (mogadon) e do diazepam (vallium).** [Myoclonic seizures: A comparative study of the anticonvulsant potency of nitrazepam (Mogadon) and diazepam (Valium).] *Arquivos de Neuro-Psiquiatria*, 1969(Sep), Vol. 27(3), 189-198.—Compared the anticonvulsant potency of nitrazepam, diazepam, and trimetadiones in 5 patients with myoclonic seizures. A placebo was also used. Therapeutic tests were performed following 4 days successive treatment designed to avoid the residual effects of 1 drug upon administration of the others. In 2 cases statistical analysis was not necessary for demonstration of the superiority of nitrazepam and diazepam regarding trimetadiones; in 2 others the application of Tukey's test allowed this same conclusion. In the last case the numeric variations of the seizures during the therapeutic essay suggest identical conclusion although the statistical analysis was not significant. There are indications that nitrazepam is more effective than diazepam against this type of epileptic seizures. (16 ref.)—*English summary.*

8785. Lison, Michel P. & Fassoni, Laertel F. (U. São Paulo, Medical School, Brazil) **Estudo clínico-eletroencefalográfico longitudinal em pacientes epiléticos tratados com Ro 5-4023.** [Longitudinal clinical and electroencephalographical studies in epileptic patients treated with Ro 5-4023.] *Arquivos de Neuro-Psiquiatria*, 1970(Mar), Vol. 28(1), 25-36.—Presents a clinical and longitudinal study of 22 epileptic patients, with daily seizures, treated with 7-nitro-5-(2-chlorophenyl)-3H-1,4-benzodiazepine-2(1H)-1 or Ro 5-4023. 20 of these Ss had received previous treatment with other anticonvulsant drugs with no satisfactory results. With the use of Ro 5-4023 the seizures were completely controlled on the 1st day in 14 Ss; in 6 there was a rapid and significant decrease in frequency and intensity of seizures; in 1, out of these 6, seizures disappeared during the 2nd wk. of treatment. Recurrence of seizures was observed in 8 Ss. The drug is effective in a large spectrum of generalized seizures; partial seizures, in particular the psychomotor seizures of infancy with slow spike-waves; the severe epileptic encephalopathy of infancy, Lennox type; and the degenerative epileptic syndrome. Drug side effects were present in 11 Ss, being of short duration in 9. In 2 Ss there was precipitation of generalized tonic-clonic seizures. (30 ref.)—*English summary.*

8786. Marques-Assis, Luis. (U. São Paulo, Medical School, Brazil) **Considerações a propósito do**

tratamento medicamentoso de 1217 pacientes epiléticos: I. Estudo em relação ao tipo de epilepsia e ao eletrencefalograma. [Drug treatment of 1217 epileptic patients: Study regarding the clinical manifestations and electroencephalographic patterns.] *Arquivos de Neuro-Psiquiatria*, 1969(Dec), Vol. 27(4), 312-320.—Administered the barbiturates hydantoin, primidone, and trimethadione—alone or in combination—to 1217 epileptic patients. Clinical manifestations and EEG patterns were studied. The following results were presented: (a) the prognosis was better in Ss with Jacksonian seizures, (b) the highest remission rate was observed in Ss having nocturnal seizures, (c) Ss having grand mal seizures without aura demonstrated the most refractory response to treatment, (d) Ss having seizures secondary to focal discharges showed the best response. Prognosis was deemed better in Ss having normal EEG patterns and in Ss demonstrating paroxysmic, bilateral, and synchronic dysrhythmia as opposed to Ss having diffuse abnormalities and temporal dysrhythmias.—*B. A. Stanton.*—English summary.

8787. **Niedermeyer, E.** (Johns Hopkins U., Div. of Neurological Surgery) **Electroencephalographic studies on the anticonvulsive action of intravenous diazepam.** *European Neurology*, 1970, Vol. 3(2), 88-96.—In 80 5-63 yr. old epileptic patients with evidence of spike discharges in the EEG, small dosages of diazepam (valium) ranging from 2-10 mg. were administered iv during the recording. 7 Ss had depth electrodes. Generalized-synchronous seizure discharges in Ss with common generalized epilepsy (also called idiopathic) proved to be most responsive to iv diazepam. Focal spikes were much less responsive to such small dosages with the exception of central spike foci in children which showed a good temporary suppression. It is concluded that this deactivation test is helpful in the distinction of different types of convulsive disorders and might shed some light on basic epileptic mechanisms. (33 ref.)—*Journal abstract.*

8788. **Niedermeyer, E., Blumer, D., Holscher, E., & Walker, B. A.** (Johns Hopkins U., Medical School, Div. of Medical Genetics) **Classical hysterical seizures facilitated by anticonvulsant toxicity.** *Psychiatria Clinica*, 1970, Vol. 3(2), 71-84.—Describes unequivocal hysterical seizures with classical posturing ("arc de cercle") in 3 patients. 2 Ss had a history of mild epilepsy and were therefore placed on anticonvulsive therapy; the 3rd S, an achondroplastic dwarf, was treated with anticonvulsants since her hysterical manifestations were initially considered epileptic. In all of these 3 Ss, the hysterical seizure frequency increased under anticonvulsive therapy and reached enormous proportions with further increases of medication. The EEG showed excessive diffuse slow activity due to cerebral toxicity and, in 2 cases, there was also neurological evidence of a toxic brain disturbance. This toxic response was obviously caused by mysoline (primidone) in 2 cases and by dilantin (diphenylhydantoin) in the 3rd S. Gradual decrease of the anticonvulsive medication was followed by attenuation and eventual disappearance of hysterical seizure manifestations.—*Journal summary.*

8789. **Okudzhava, V. M.** **Osnovnye neirofiziologicheskie mekhanizmy epilepticheskoï aktivnosti.** [Basic neurophysiological mechanisms of epileptic activity.] Tbilisi, USSR: Ganatleba, 1969. 228 p.—Examines and discusses (a) the methodology and

techniques, employed by the author in his investigations; (b) the basic cellular phenomena of epileptic activity in the cerebral cortex; (c) the role of the electrical field in the epileptic discharge of neurons; (d) the formation of secondary foci of epileptic activity; (e) neuronal organization of the tonic and clonic phases of cortical epileptic activity; (f) inactivation of neurons by depolarization as a mechanism for cutting off epileptic activity (its connection with the phenomenon of spreading depression); and (g) the probable inhibitory structure involved in the cessation of epileptic activity. (English summary)

8790. **Riklan, Manuel & Levita, Eric.** **Psychological studies of thalamic lesions in humans.** *Journal of Nervous & Mental Disease*, 1970(Apr), Vol. 150(4), 251-265.—Assessed psychological changes associated with ventrolateral thalamic lesions through standardized testing of 50 parkinsonians undergoing initial left hemisphere, initial right hemisphere, and 2nd side surgery for relief of tremor and rigidity. Immediate postoperative declines in cognitive and perceptual functions were found, with a return to preoperative status in follow-up testing. The concepts of physiological disruption and functional reintegration and compensation are discussed to explain these findings. Lateralized differences were found with reference to tests involving use of verbal symbols in left hemisphere, and 2nd side operates, regardless of hemisphere, with worsening in performance immediately postoperatively. To a lesser degree, right brain operates were more affected in spatial-perceptual performance. Emphasis is placed on the relative roles of direction and arousal in behavior in considering the pattern of postoperative change. (33 ref.)—*Journal summary.*

8791. **Rupollo, Wadir.** **Tratamento da epilepsia com a associação de Gardenal e Cafeína: Apresentação de 84 casos.** [Treatment of epilepsy with a combination of Gardenal and Caffeine: Presentation of 84 cases.] *O Hospital*, 1968(Sep), Vol. 74(3), 773-777.—84 epileptics were administered doses of gardenal and caffeine, in a 2:1 ratio, beginning with a minimum dosage of 4 cg. gardenal for every 2 cg. caffeine. Dosage was increased until all symptoms, including convulsions and others, disappeared. In 65 Ss, doses of .24 gm. gardenal/day were effective. The final dosage was considered relative to S's age, sex, length of time in the clinic, and number of daily, weekly, or monthly crises.—*P. Hertzberg.*

8792. **Stevens, Janice R.** (U. Oregon, Medical School, Portland) **Focal abnormality in petit mal epilepsy.** *Neurology*, 1970(Nov), Vol. 20(11), 1069-1076.—Reviews the various sites of origin for the 3-cps symmetrical synchronous spike-wave discharge associated with petit mal epilepsy. 3 clinical cases are reported in detail, in 1 of which chronic intracranial subtemporal electrodes demonstrated a mesial temporal focus. Pathological findings are reported from 2 children with bilateral spike-wave paroxysms in the EEG, both of whom had clinical attacks of petit mal absence, and 1 of whom, in addition, displayed gelastic seizures and precocious puberty. Compression of brainstem structures by neoplasm was demonstrated in both. The evidence for a restraining influence of ascending brainstem pathways on the development of bilateral synchrony and for central or cortical genesis of the bilateral spike-wave discharge is reviewed. Possible impairment of the anatomical and biochemical integrity of ascending

midbrain inhibitory systems by lateral brainstem compression during mesial temporal herniation associated with elevated intracranial pressure is considered as a possible predisposing factor in bilateral spike-wave discharge.—*F. O. Triggs.*

8793. **Supino, V.** (U. Naples, Clinic for Nervous & Mental Illness, Italy) **Episodi critici di natura epilettica quali complicazioni della vaccinazione antipoliomielitica con vaccino orale Sabin.** [Critical epileptic episodes which appeared as a complication of antipoliomyelitis oral Sabin vaccine.] *Acta Neurologica*, 1969(Jan), Vol. 24(1), 62-65.—Presents 9 case histories of epileptic disorders, correlated with EEG abnormalities appearing within 10-15 days after a vaccination with Sabin oral polio vaccine. It is suggested that a relationship exists between the vaccination and the observed epileptic disorders.—*English summary.*

8794. **Tutton, Joseph C.** (State U. New York, Medical School, Buffalo) **New treatment for old neurologic disease: Status epilepticus treatment with diazepam.** *New York State Journal of Medicine*, 1970(Oct), Vol. 70(19), 2425-2428.—Based on a study involving 42 patients with 47 episodes of status epilepticus treated with diazepam (valium) and growing support in the medical literature, it is concluded that this drug is an effective form of initial therapy, regardless of seizure type, its presumed cause, or its duration. The drug also proved to be a safe form of treatment with only reversible lingual airway obstruction seen as an untoward reaction. No episodes of hypotension, respiratory suppression or arrest, cardiac arrest, or alteration of blood or urine were encountered. (24 ref.)—*Journal summary.*

8795. **Wada, Toyoji; Goto, Akira; Fukushima, Yutaka, & Tateyama, Koh.** (Hirosaki U., Medical School, Japan) **Trattamento da epilepsia.** [Treatment of epilepsy.] *O Hospital*, 1968(Sep), Vol. 74(3), 859-868.—Describes the effects of a new antiepileptic drug gabimetal (GABA) on 150 epileptics. In 99 Ss with a total of 116 epileptic crises, traditional antiepileptic medication was used. In these Ss, improvement was noticed in 22%, no effect in 48%, and deterioration in 30%. In 25 "old" cases with a total of 37 epileptic crises, traditional medication was supplemented with GABA and dosages of traditional medication were reduced. The effects caused improvement in 14%, no change in 45%, and deterioration in 41%. In 26 new cases, with a total of 28 epileptic crises, GABA alone resulted in 50% of Ss being completely controlled and 25% being significantly improved. The optimum dosage was 1-5 gm/day for adults and .5-1 gm/day for children. GABA was most effective in convulsive type episodes and in children.—*P. Hertzberg.*

8796. **Waddington, Margaret M.** (Professional Park, Rutland, Vt.) **Angiographic changes in focal motor epilepsy.** *Neurology*, 1970(Sep), Vol. 20(9), 879-888.—Cerebral angiography is usually performed in patients with focal motor epilepsy because of possible association of seizures with tumor or vascular or structural abnormality. An attempt is made to point out that characteristic findings do occur in patients with this malady and involve the arteries supplying the motor and premotor areas of the cerebral cortex. The angiographic findings in 23 cases of focal motor epilepsy without obvious cause are presented. In 16 cases there were occlusions of small branches to the motor or premotor areas or both. Neurological abnormalities were present

in all these cases; most of the patients were in the older age group. A distinct and previously unreported abnormality was found in 7 patients in which no occlusions were present but an artery supplying the motor area was vestigial in appearance. These Ss had no neurological deficit, and, for the most part, no other abnormal findings. All occurred in a younger age group; there was 1 10-yr-old boy and the other 6 were from 20-34 yr. of age at the onset of symptoms. While the precise mechanism by which the small artery and focal motor seizures are related is not clear, the vascular changes are sufficiently characteristic to allow an angiographic diagnosis.—*F. O. Triggs.*

MENTAL RETARDATION

8797. **Allen, Robert M., Cortazzo, Arnold D., & Adamo, Cynthia.** (U. Miami) **Factors in an adaptive behavior check list for use with retardates.** *Training School Bulletin*, 1970(Nov), Vol. 67(3), 144-157.—Assigned each resident of a training center to 1 of 4 divisions: vocational rehabilitation, education and training, independent living, and development and training, on the basis of ratings by cottage parents and supervisors on the revised version of the Adaptive Behavior Check List (ABCL). The ratings on this ABCL were subjected to factor analysis. 8 factors in 3 major clusters emerged thus furnishing concurrent (factorial) validity of the ABCL. The items contributing to each factor are given. Besides the basic, primary, and secondary functions clustering of the factors, there is objective evidence that cottage parents and supervisors are reliable Os and can give valid estimates of a resident's adaptation to daily living.—*Journal abstract.*

8798. **Bass, Medora S.** **Pastoral counseling on voluntary sterilization for retarded individuals.** *Pastoral Psychology*, 1969(Dec), Vol. 20(199), 33-40.—Informed clergymen have contributed much toward breaking the taboo on birth control. Now they can do much to bring the need for sterilization into the open for discussion among professionals, parents of retarded children, and among retarded individuals themselves. By knowing where to refer patients, clergymen can help deprived members of society to find support and love within marriage without being overburdened by children they are incapable of rearing properly.—*O. Strunk.*

Texas) **The blind retardate: Three program suggestions.** *Training School Bulletin*, 1970(Nov), Vol. 67(3), 172-177.—Presents 3 specific suggestions to improve their enjoyment and enhance learning primarily for the educable, blind retardate: (a) an adaptation of the game Hide-and-Seek; (b) a musical approach to social orientation which correlates popular music from certain time periods with certain age groups (e.g., Glenn Miller type music with 40-55 yr. olds); and (c) using dream content as a resource for the idiosyncratic wants and needs of this group.—*M. West.*

8803. Deb, Subimal. **Directional changes influencing lumen shift in the discrimination judgments of lengths by severely retardates.** *Bulletin of the Council of Social & Psychological Research, Calcutta*, 1968, No. 10-11, 1-4.—Investigated the findings of I. Z. Holowsky (see PA, Vol. 39:8374) that errors in discrimination judgments of length are inversely proportional to the IQ of the S. 30 severe retardates were tested with 10 rods of 1-10 cm. The rods were presented horizontally and vertically in pairs, taking 1 cm. as standard and pairing with a longer rod. The ability to discriminate lengths under both conditions improved with the IQ of the S. It was further found that the difference in discrimination between the horizontal and vertical conditions was significant at the .01 level, with the horizontal discriminations being more accurate.—*S. Knapp.*

8804. Dever, Richard B. & Gardner, William I. (Indiana U.) **Performance of normal and retarded boys on Berko's Test of Morphology.** *Language & Speech*, 1970(Jul), Vol. 13(3), 162-181.—Administered J. Berko's test of morphology to 2 groups of educable mentally retarded (EMR) public school boys who were matched on CA and MA respectively to groups of normal public school boys. The total sample was 140 Ss. Results were analyzed using 26 teachers' responses as criteria for "correctness." In general, neither group of EMRs performed as well as normal Ss. Criticisms of the test on the basis of the obtained results and suggestions for modifications are presented.—*Journal abstract.*

8805. Dolejš, Mojmir. **K psychologickým otázkám mentální retardace.** [Psychological questions of mental retardation.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(2), 147-159.—Reviews the literature, and concludes that: (a) there still exists terminological confusion and a diversity of definitions concerning mental retardation; (b) the global psychometric conception in the form of a universal IQ is becoming more and more unsatisfactory from the prognostic, clinical, and pedagogical standpoint, instead conditions leading to retardation are being analyzed; (c) conceptions of minor brain dysfunction and of emotional, sensory, and social deprivation lead to differentiation of mentally retarded children previously considered "feeble-minded" because of scholastic underachievement; and (d) in the field of school education, it is still not possible to identify mental retardation and failure in school work in a number of

children. Based on research showing that social environment considerably affects personality development and behavior of mentally retarded children, and on the fact that as society grows more technical, social efficiency of the mentally retarded becomes more difficult, it is suggested that more attention be devoted to the application of social learning theory in mental retardation. (Russian summary) (3 p. ref.)—*English summary.*

8806. Dybwad, Gunnar. (Brandeis U., Graduate School for Advanced Studies in Social Welfare) **The importance of prevention in mental retardation.** *Mental Retardation*, 1969(Apr), Vol. 7(2), 3-6.—Examines the federal and local attempts at prevention of mental retardation, emphasizing policies and strategies. Professional cooperation, reshaping of educational programs, improved research, and reorganization and reorientation of the American Association on Mental Deficiency are viewed as essential.—*G. Steele.*

8807. Evans, D. & Hampson, M. (U. Exeter, England) **The language of mongols.** *British Journal of Disorders of Communication*, 1969(Oct), Vol. 3(2), 171-181.—As a preliminary to an investigation into the language skills of mongols attending day and residential centers, the relevant literature is reviewed. Findings and issues involved are discussed with regard to: the Down's syndrome, the acquisition and development of language, environmental effects, and therapy. (54 ref.)—*Journal abstract.*

8808. Gardner, James M. & Glampa, Franklyn L. (Orient State Inst., O.) **Behavioral competence and social and emotional behavior in mental retardates.** *American Journal of Mental Deficiency*, 1970(Sep), Vol. 75(2), 168-169.—Examined the relationship between intellectual level and social and emotional behavior (SEB) in an institutionalized mentally retarded population. 2 preadolescent boys were randomly selected from each of 3 groups: moderately, severely, and profoundly retarded. 2 judges recorded the frequency of inappropriate SEBs (e.g., screaming, hitting) during a 1/2-hr recreation period. 8 30-min samples were obtained for the 6 Ss. The 3 groups did not differ significantly in inappropriate SEBs. The independence of SEB from intellectual functioning indicates the need for their conjoint measurement, rather than relying on such unidimensional measures as the IQ or social quotient.—*Journal abstract.*

8809. Hammond, Jack; Sternlicht, Manny, & Deutsch, Martin R. (Willowbrook State School, Staten Island, N.Y.) **Parental interest in institutionalized children: A survey.** *Hospital & Community Psychiatry*, 1969(Nov), Vol. 20(11), 338-339.—Only 14.7 % of 5110 families of children in an overcrowded state school for retarded children responded to the survey questionnaire sent to them regarding the possibility of setting up an appointment to discuss their child's program and progress and to explore the possibility of his living at home. Of those who did respond, virtually none desired to have their children released to them. This reluctance reflects the need for additional community services that might enable parents to remove their child from the institution.—*M. Walker.*

8810. Jacobs, Jerry. (U. California, Riverside) **The search for help: A study of the retarded child in the community.** New York, N.Y.: Brunner/Mazel, 1969. ix, 135 p. \$5.95.

8811. Jorgenson, Helen & Parnell, Martha K. (Cleveland Music School, O.) **Modifying social behaviors of mentally retarded children in music activities.** *Jour-*

nal of Music Therapy, 1970(Fal), Vol. 7(3), 83-87.—Describes "the modification of inappropriate social behaviors in 4 moderately retarded children [all were 8-9 yr. old with IQs from 40-55]." The data revealed that several behaviors, such as hitting, yelling, pushing, and not participating in the activity, interfered with participation and appropriate interaction. As these behaviors occurred frequently, it was necessary to eliminate them before the therapist could begin a program to increase appropriate initiation of verbal and nonverbal interaction. Therefore, the final choice of specific behaviors to be modified were: hitting, yelling, pushing, and nonparticipation. 4 specific musical activities were chosen: (a) the "shaker" game, (b) the Indian game, (c) "The Hokey Pokey," and (d) listening to records. A point system was devised to reward the elimination of interfering social behavior. Results "indicate that all interfering behaviors decreased, and participation increased." The next step will be to begin a new program designed to increase appropriate initiated and imitated verbal and nonverbal responses. "Finally, the effectiveness of the entire procedure will be evaluated. By observing, defining, recording, specifying, and evaluating behaviors to be modified, and by delineating the "common environment" of music, the E enables other music therapists to replicate his procedures, which increases the effectiveness of music therapy in modifying social behaviors.—F. O. Triggs.

8812. Kirman, Brian. **Mentally handicapped persons.** *British Medical Journal*, 1968(Dec), Vol. 4(5632), 687-690.—Discusses the diagnosis, development, education and training, and progressive conditions of mentally handicapped persons. Advice to parents, other handicaps, and genetic advice concerning mental retardation are also examined. 3 illustrative cases are presented. It is concluded that there is "no sharp distinction between the mentally handicapped and the general population" and that many mentally handicapped persons can function above the expected level if given the proper environment.—G. Steele.

8813. Klujber, L., Cholnoky, P., & Méhes, K. (U. Pécs, Medical School, Hungary) **Urinary excretion of beta-aminoisobutyric acid in Down's syndrome and in idiopathic mental retardation.** *Human Heredity*, 1969, Vol. 19(5), 567-572.—Investigated β -aminoisobutyric acid (BAIB) excretion in 41 patients with Down's syndrome and the results were compared with those obtained from 87 normal individuals and from 51 mentally retarded patients. In Down's syndrome there is a higher excretion of the compound, but there is no difference in BAIB excretion between normal children and the unclassified mentally retarded. A clear-cut decrease of BAIB excretion with increasing age is shown in both Down's syndrome and normal children.—*Journal abstract.*

8814. Owens, Earl P. & Bowling, Donald H. (Pacific State Hosp., Socio-Behavioral Lab., Pomona, Calif.) **Internal consistency and factor structure of the Preschool Attainment Record.** *American Journal of Mental Deficiency*, 1970(Sep), Vol. 75(2), 170-171.—Analyzed the performance of 100 retarded children on the research edition of the Preschool Attainment Record to provide an estimate of the internal consistency of the 8 subtests and the PAR as a whole, and to determine the factor structure of the 8 subtests. The internal consistencies were satisfactorily high; factor analysis indicates 2 factors to account for most of the variance, a

physical-developmental factor, and a social-intellectual factor.—*Journal abstract.*

8815. Perske, Robert. (Kansas Neurological Inst., Topeka) **Ministry and mental retardation.** *Pastoral Psychology*, 1969(Oct), Vol. 20(197), 21-27.—In dealing with the mentally retarded and their families, the minister often finds his theological presuppositions seriously challenged. But in accepting the challenge he may be led to significant new insights.—O. Strunk.

8816. Reardon, Diane M. & Bell, Graham. (U. California, Los Angeles) **Effects of sedative and stimulative music on activity levels of severely retarded boys.** *American Journal of Mental Deficiency*, 1970(Sep), Vol. 75(2), 156-159.—Tested 3 predictions of the effects of musical stimulation on activity level of 11 6-17 yr. old severely retarded institutionalized boys. Ss' activity scores during sedative and stimulating music were compared with levels during base line (no recording) and nonmusical (spoken recording) conditions. 14 behavioral categories were rated by trained Os during 8 hr. of observation under each of the 4 conditions. Activity level varied significantly with day of the experimental wk., suggesting that the novelty of recordings is a significant factor. Differences in activity due to conditions tended to confirm the prediction of lower activity levels during the more stimulating conditions.—*Journal abstract.*

8817. Ribas-Mundó, M. **Factores genéticos en el retraso mental.** [Genetical factors in mental retardation.] *Anuario de Psicología*, 1970, Vol. 1(2), 29-43.—"Diseases that accompany mental retardation and in which genetical factors intervene are classified as (a) chromosome abnormalities, (b) hereditary-metabolic abnormalities, (c) miscellaneous. The 1st group is characterized by the Down or trisomia 21, the cri du chat syndromes. Sexual chromosome abnormalities also appear in mental retardation, in particular the Klinefelter and triple-X syndromes. 2 interesting aspects of the XYY syndrome are its mental retardation and tendency toward delictual acts in Ss of more than 180 cm. [5'11"] in height. Hereditary and metabolic changes form a large group of diseases in which mental retardation appears frequently. The aminoacidurias are generally due to enzyme defects that are transmitted autosomatically and recessively. Due to their frequency, the most important aminoacidurias are fenilcetonuria and homocistinuria. Other diseases with metabolic and hereditary abnormalities and mental retardation are classified as lipoidosis and mucopolisaccharidosis. There are many mental retardation syndromes whose basic etiopathogenetic abnormality is still unknown (classified as 'miscellaneous')." (26 ref.)—S. Maze.

Sen, Anima & Sen, Arun K. **A short introduction to the researches in the field of mental deficiency in England.** *Bulletin of the Council of Social & Psychological Research, Calcutta*, 1967, No. 8, 20-25.—Surveys research in mental deficiency in England, particularly from 1950, and identifies 3 stages in development: laboratory experiment, research in industrial training, and a reversion to the laboratory. It is found that there is a growing multidisciplinary interest in the problems of mental abnormality. (52 ref.)—*Journal abstract.*
8819. Siguán, Miguel. (U. Barcelona, Spain) **La personalidad del deficiente mental.** [The personality of the mentally deficient child.] *Anuario de Psicología*, 1970, Vol. 1(2), 44-64.—Discusses (a) the mental

deficiency and personality of a retarded child, (b) the retardation in intellectual development, (c) the rejection of a retarded child (manifested by guilt, hostility, shame, forgetfulness, etc., by parents or environment such as school), (d) the personality of the mentally retarded child and his various defense mechanisms (regression and aggressiveness) and compensations (dreaming, being funny, etc.), (e) school and mental retardation, (f) special education, and (g) the social integration of the mentally deficient child. It is proposed that, this mental deficiency, along with the feeling of failure and inferiority that normally accompany it, ends up by changing a retarded child's personality and endangering his social integration. It is ascertained that the main problem of such a child is not as much the progress of his intelligence as the formation of his personality. It is concluded that this can only occur within the context of a personal relationship based on an honest desire to help on the part of the educator. The child seeks the security he is not able to find within his own environment. Because he often has psychic problems, the type of education suggested is a psychotherapeutic one.—S. Maze.

8820. Singer, Benjamin D. & Osborn, Richard W. (U. Western Ontario, London, Canada) **Social class and sex differences in admission patterns of the mentally retarded.** *American Journal of Mental Deficiency*, 1970(Sep), Vol. 75(2), 160-162.—Asserts that sex differences in admissions to mental retardation treatment centers are the result of variations in sex-role expectations rather than physiological differences. Data on age, sex, social class, and measured IQ from 2360 admissions to a regional diagnostic and treatment center indicate higher male IQs and that differences between male-female IQ levels increase with age and social class. This suggests that a lower level of sensitivity toward females exists and that many females who might benefit from treatment are not identified by current case finding techniques.—*Journal abstract*.

8821. Smeets, Paul M. (Woods Schools, Langhorne, Pa.) **Withdrawal of social reinforcers as a means of controlling rumination and regurgitation in a profoundly retarded person.** *Training School Bulletin*, 1970(Nov), Vol. 67(3), 158-163.—Reports the treatment of a profoundly retarded 18-yr-old boy whose life was endangered by severe vomiting and rumination. A continuous conditioning paradigm heavily based on withdrawing social reinforcers significantly reduced the frequency and amount of regurgitation as well as of rumination. During the treatment period S gained 9 lb., and from the medical viewpoint was out of danger.—*Journal abstract*.

8822. Stewart, James A. & Daniels, Lloyd K. (Dept. of Youth Resources, Brookline, Mass.) **A modified scoring procedure for the Machover Draw A Person Test in assessing the self concept of mentally retarded subjects.** *Training School Bulletin*, 1970(Nov), Vol. 67(3), 178-182.—Examined the performance of 40 educable mentally retarded males on a projective drawing task using a scoring technique based on 9 characteristics descriptive of the self-concept. Analysis of the scoring procedure revealed 2 qualitatively distinct groupings of scoring criteria along a dimension described as visually apparent or objective to visually less apparent or subjective. It is concluded that such differentiation will assist systematic analysis of drawings and should be employed to further clarify unexpected results following hypothesis testing.—*Journal abstract*.

8823. Stone, Nellie D. (Newark State Coll., Child Study Inst.) **Effecting interdisciplinary coordination in clinical services to the mentally retarded.** *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 835-840.—Examines organizational principles that foster effective clinical service in light of recent community mental health concepts. The following processes are identified: (a) freedom of communication, (b) sharing of responsibility for decision-making and leadership, (c) respect for individual status and competence, (d) encouragement of both inter- and independent functioning, (e) development of congenial interpersonal feelings and role consensus among staff members, and (f) continuous evaluation of clinical functioning in the light of shared reality.—*Journal abstract*.

8824. Talkington, Larry W. & Hall, Sylvia M. (Austin State School, Tex.) **A musical application of Premack's hypothesis to low verbal retardates.** *Journal of Music Therapy*, 1970(Fal), Vol. 7(3), 95-99.—A design based on Premack's hypothesis compared matched groups of retardates ($N = 21$) of low verbal ability on echoic response production under 3 reinforcement conditions. "Most preferred" music activity, "least preferred" music activity, and "non-music" control conditions were used as reinforcers contingent upon improvement over the performance of the previous day. Performance curves for the group demonstrated a significantly steeper gradient for the "most preferred" music group than for the "least preferred" or control groups. The following conclusions seem warranted based on the results of this and previous studies: (a) Differential preferences for music activities can be determined by use of operant base-line responses of retarded Ss. (b) The reinforcing properties of differential music preferences may be predictable on the basis of Premack's hypothesis. (c) Verbal production as measured by echoic responses can be increased through the use of musical activity reinforcers. (d) A considerable amount of experimentation is needed to clarify classes of music activity or music-related preferences of the retarded. The interaction of attention and reinforcing variables is in need of study and would seem to offer a promising area of exploration for the language and speech development disciplines.—*Journal summary*.

8825. Zarfas, D. E. (Ontario Dept. of Health, Toronto, Canada) **The mentally retarded and the physician.** *Canadian Medical Association Journal*, 1970(Apr), Vol. 102(7), 733-735.—Discusses the physician's problems in dealing with prevention, diagnosis, and management of the mentally retarded. It is concluded that medical, educational, and social agencies must work more closely together in dealing with these problems.

Learning & Motor Ability

8826. Brown, Ann L. (U. Connecticut) **Subject and experimental variables in the oddity learning of normal and retarded children.** 1970(Sep), Vol. 75(2), 142-151.—Reports a comparative study of oddity learning in Exp. I where the performance of 16 retarded and 16 bright children is compared to that of their normal MA and CA peers. Analysis of the resultant normal-retarded difference suggests an attentional deficit in the performance of the retarded Ss. Attention-engineering techniques, introduced in Exp. II with 48 retarded Ss,

proved effective in increasing the number of retardates reaching solution. Emphasizing the relational component was a more effective technique than emphasizing the dimensional component of the oddity task. Results are discussed in relation to an attention theory analysis of discrimination and relational learning. (17 ref.)—*Journal abstract*.

8827. Leicht, Kenneth L. & Johnson, Richard P. (Illinois State U.) **Effects of rehearsal instructions on recall and organization in free learning of retardates.** *American Journal of Mental Deficiency*, 1970(Sep), Vol. 75(2), 163-167.—Examined recall and organization of a category list and a list of difficult-to-group, low-meaningful trigrams under conventional free-learning memorization instructions and under free-learning instructions designed to inhibit organization. Ss were 48 educable mental retardates. For both lists, organization-inhibiting instructions reduced recall as well as subjective organization. A finding that subjective organization of the category list was accompanied by minimal category clustering suggested that organization in the mentally retarded is underestimated when scored only along predetermined categories. For both lists, variations in organization were too small to account for recall variation.—*Journal abstract*.

8828. Sen, Anima, & Sen, Arun K. **The effect of distraction on a perceptual motor task in the subnormal.** *Bulletin of the Council of Social & Psychological Research, Calcutta*, 1968, No. 10-11, 22-25.—Investigated distraction in a group of 14 mentally deficient adults. Ss were given a plastic typewriter key-top sorting task once under normal conditions, and once under a distraction condition, consisting of a recorded story presented over earphones. Results show that the performance of the Ss was not impaired in the presence of extraneous stimuli: speed increased without reduction in the level of performance. Findings are discussed in relation to the hypothesis of interaction between the level of task difficulty and presence of extraneous stimuli, and the possibility of using the concept of arousal is discussed in relation to the significant increase in speed during distraction. (17 ref.)—*Journal abstract*.

8829. Sen, Arun K. & Sen, Anima. **Free recall as a function of exposure time.** *Bulletin of the Council of Social & Psychological Research, Calcutta*, 1968, No. 10-11, 5-11.—Reports an experiment concerning the effect of different exposure rates on a free recall. Ss were 7 severely retarded adults. 7 different sets of pictures of common objects (10 pictures in each set), and 7 different exposure rates (.25, .50, .75, 1, 2, 4, and 8 sec.) were taken. Ss exposure rates, picture sets, and the temporal factor were counter balanced by using a Graeco-Latin square design. Results suggest that the rate of presentation is an important factor in memory experiments, and that learning difficulty in the severely subnormal can be partially overcome by manipulating the rate of presentation. (19 ref.)—*Journal abstract*.

8830. Stubbs, Barbara. **A study of the effectiveness of an integrated, personified approach to learning with trainable mental retardates.** *Journal of Music Therapy*, 1970(Fal), Vol. 7(3), 77-82.—Demonstrates "2 approaches to the use of music to aid trainable mental retardates (TMRs) in learning factual material and certain types of discrimination." 7 musical instruments were presented to 2 groups of TMRs. In 1 group the instruments were presented with photographs and solo recordings; in the other, an integrated, personified

approach was created with a story and imaginative drawings. It was hypothesized that the TMR will learn more effectively through the method which uses imaginative drawings and an integrated, personified story, and he will have better discrimination of contrasts afterward. Results seem to indicate that the approach used with the experimental group is effective.—F. O. Triggs.

Training & Vocational Rehabilitation

8831. Eyman, Richard K., Tarjan, George, & Cassady, Michael. (Pacific State Hosp., Socio-Behavioral Lab., Pomona, Calif.) **Natural history of acquisition of basic skills by hospitalized retarded patients.** *American Journal of Mental Deficiency*, 1970(Sep), Vol. 75(2), 120-129.—Increasing numbers of retarded individuals are participating in community programs, where their adjustment depends on basic self-care skills. Limited information is available on the acquisition of these skills, and such data are needed, particularly for the assessment of training and treatment programs. A 2-yr admission cohort (N = 727) at a state hospital was followed for 3 yr., and assessed annually with respect to ambulation and toilet training. A simple Markov chain was used for analysis. The outlook for nonambulatory and nontoilet-trained patients under standard care was poor. A small subgroup receiving more intensive treatment had a better prognosis. (18 ref.)—*Journal abstract*.

8832. Goldman, Michael S. (U. Wisconsin) **Identification of barriers and facilitators in the vocational habilitation of educable mentally retarded youth.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1518.

8833. Jackson, Martha E. & Jackson, Newton L. (Santa Barbara County Schools Dept., Calif.) **Educational application of behavior modification techniques with severely retarded children in a child development center.** *California Journal of Educational Research*, 1970(Mar), Vol. 21(2), 68-73.—Attempted to determine if profoundly retarded children involved in a day treatment setting could benefit from application of the principles of behavior modification. A 4 and a 10 yr. old were selected for 4-5 wk. of special treatment; 1 program was aimed at developing the initial response of looking toward someone who called her by name; and the other, for the 10-yr-old boy, was designed to reduce his aggressive saluting behavior. Data indicate that behavioral modification techniques can be used on a short-term basis to alter behavior in children who manifest acute management problems. This study could not determine the durability of such changes over time nor assess the amount of retraining necessary to reinforce the new patterns. Future new roles for the school psychologists in general were discussed in the direction of a more prescriptive role.—H. J. McWhinnie.

8834. Nixon, Russell A. (Columbia U., School of Social Work) **Impact of automation and technological change on employability of the mentally retarded.** *American Journal of Mental Deficiency*, 1970(Sep), Vol. 75(2), 152-155.—Widely held views that automation and advancing technology end the need for full use of all potential labor resources and eliminate unskilled jobs in the economy would suggest less feasibility and less emphasis on vocational rehabilitation of the mentally retarded. It is argued that such views are unfounded. The

evidence regarding the impact of technological change and national production goals indicates continued need for all potential labor supply and no reduction, but rather possibly an increase, in the opportunities for successful employment of the mentally deficient. (18 ref.)—*Journal abstract.*

PHYSICAL ILLNESS

8835. Altschek, Albert; Wiener, Jerry M., & Stevenson, Stuart S. (1 E. 89th St., New York, N.Y.) **Psychologic and social factors in pediatric gynecology clinic care.** *New York State Journal of Medicine*, 1969(Dec), Vol. 69(24), 3134-3137.—Discusses different conditions, circumstances, and cases to illustrate the advantages to the pediatric gynecologist of concerning himself with the emotional, social, and cultural influences which bear on his patients' pathologic conditions.—*Journal summary.*

8836. Booth, Gotthard. **Pastoral psychology: The next 20 years: In ministry to the sick.** *Pastoral Psychology*, 1970(Feb), Vol. 21(201), 22-28.—Discusses the future role of ministers in the care of the sick in the contexts of changing concepts of clinical training for clergy, new images of health, and the nature of ministry of healing. (25 ref.)—*O. Strunk.*

8837. Braceland, Francis J. (Inst. of Living, Hartford, Conn.) **Pastoral psychology: The next 20 years: In relation to medicine.** *Pastoral Psychology*, 1970(Feb), Vol. 21(201), 16-22.—Since medicine is changing rapidly and pastoral counseling is achieving greater identity, there are many areas in which the 2 can interact meaningfully, especially in the handling of the existential problems of those in the middle and old age groups. Both disciplines, however, will need to remain open and flexible in the midst of new demands and developments.—*O. Strunk.*

8838. Collard, Kenneth L. **Hypnosis in general practice of medicine.** *Journal of the American Society of Psychosomatic Dentistry & Medicine*, 1970, Vol. 17(2), 39-45.—A family physician describes his use of hypnosis in the treatment of 10 of his patients. Anxiety, overweight, smoking, stuttering, functional abdominal distress, and emphysema are some of the medical conditions treated.—*M. V. Kline.*

8839. Friedman, Eli A., Goodwin, Norma J., & Chaudhry, Lily. **Psychosocial adjustment to maintenance hemodialysis: I.** *New York State Journal of Medicine*, 1970(Mar), Vol. 70(5), 629-637.—Studied the psychosocial adjustment of 20 patients, undergoing maintenance hemodialysis for at least 1 yr. in a municipal hospital center. A mean of 31% of the Ss' work week was consumed by actual dialysis or activities necessitated by hemodialysis therapy. Gainfully employed Ss adjusted to a reduced annual income and a shorter work week. Ss' total rehabilitation was made difficult by 2 components of the therapeutic regimen: the placement of external arteriovenous shunts, and the required sodium-restricted diet. Despite frequent hospitalizations, a mean of 28 days/yr/patient, most Ss are able to work, tend house, or participate in school activities.—*Journal summary.*

8841. Greenberg, Harvey R. & Blank, H. Robert.

(Albert Einstein Coll. of Medicine, Yeshiva U.) **Dreams of a dying patient.** *British Journal of Medical Psychology*, 1970(Dec), Vol. 43(4), 355-362.—Presents the case of a 50-yr-old man fatally ill with cancer, with special attention given to his dreams. His dreams demonstrate the recognition of physical dissolution and the wish to be well already. Also noted is the libidinization of death, its equation with incestuous feelings towards the mother, the process of premorbid object decathexis, and the increasingly unambivalent wish to die.—*Journal summary.*

8842. Hall, James T. (Sibley Memorial Hosp., Washington, D.C.) **A dynamic concept of praying for the sick.** *Pastoral Psychology*, 1969(Oct), Vol. 20(197), 43-48.—Provides specific guides and verbatim reports of how to utilize prayer in the pastoral care of patients.—*O. Strunk.*

8843. Hallauer, Dean S. (U. Washington) **Illness behavior: An experimental investigation.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 913-914.

8844. Humphreys, John M. (Pacific Medical Center, Presbyterian Hosp., San Francisco, Calif.) **The unknown in focus.** *Pastoral Psychology*, 1969(Jun), Vol. 20(195), 31-40.—Discusses the presurgical procedures used by a chaplain in a specialized hospital, identifies feelings of patients on the eve of surgery, reviews the defense mechanisms utilized by patients in order to cope with such feeling, and discusses a ministry to patients that is consistent with good patient care and the chaplain's professional integrity.—*O. Strunk.*

8845. Johnson, John & Clift, A. D. (Manchester Royal Infirmary, England) **Dependence on hypnotic drugs in general practice.** *British Medical Journal*, 1968(Dec), Vol. 4(5631), 613-617.—Of the patients in an industrial general practice, 1.3% required hypnotic drugs regularly. They were predominantly in the older age groups (mean 62.7 yr.) with an excess of widows. Only .02% were severely dependent. There were 3 main original indications for hypnotics: medical (pain), psychiatric, and onset insomnia in anxious personality disorder. 1/3 of the Ss 1st took hypnotics while hospitalized. The group as a whole manifested a high degree of abnormal psychological disposition. It is suggested that many patients who take hypnotics regularly may be placebo reactors, and a more critical attitude to hypnotic prescribing is required both in hospital and in general practice. (22 ref.)—*Journal abstract.*

8846. Julich, H., Strössel, K., & Schönfelder, J. (District Hosp., Medical Clinic, Leipzig, E. Germany) **Die Bedeutung neuropsychiatrischer Symptome beim Myocardinfarkt.** [The significance of neurological and psychiatric symptoms in myocardial infarctions.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(Aug), Vol. 22(8), 293-298.—Reviews the medical literature which indicates high occurrence of cerebral symptoms in myocardial infarct patients. In an experimental group of 70 patients, 44% showed neurological and psychiatric symptoms which unequivocally had an unfavorable influence on prognosis and clinical course. This group also contained more females of advanced age (70-79) than the majority. (29 ref.)—*K. J. Hartman.*

8847. Lachkepani, A. N. & Madzhagaladze, N. A. **Adaptatsionno-kompensatornye vozmozhnosti villizatsiya kruga pri patologii magistral'nykh sudov golovy.** [Adaptive-compensatory capacities of Willis'

circle in case of pathology of the magistral vessels of the head.] Tbilisi, USSR: Sabchota Sakartvelo, 1969. 88 p.—Deals with (a) questions of compensation of cerebral circulation due to pathology of the magistral vessels, and (b) the ways in which the development of compensatory circulation proceeds due to occluding lesions of the cerebral vessels.—I. D. London.

8848. Meyer, Harry M. (National Inst. of Health, Div. of Biologics Standards, Bethesda, Md.) **The control of rubella and other virus infections in the prevention of mental retardation.** *Mental Retardation*, 1969(Apr), Vol. 7(2), 17-18.—Discusses the development of rubella vaccines which are "attenuated, noncommunicable, and capable of protecting the natural disease." The congenital defects associated with rubella and their formation are examined.

8849. Nathan, Susan & Pisula, Dorothy. (Children's Hosp., Pittsburgh, Pa.) **Psychological observations of obese adolescents during starvation treatment.** *Journal of the American Academy of Child Psychiatry*, 1970(Oct), Vol. 9(4), 722-740.—Studied how a young adolescent copes with the stress of starvation, what motivates him to starve, and whether such a group would delineate developmental characteristics of the child for whom obesity is a major symptom. Data collected from 8 female and 7 male 12-16 yr. olds weighing 164-306 lb. at the time of a 4-wk hospitalized fast, and 8-24 mo. postfast consisted of: family histories; psychological tests including the Rorschach, Figure Drawing, the WISC, and the Embedded Figures Test; informal behavioral observations; and records of weight losses and gains. Results show that Ss: (a) had average IQs, but functioned at immature developmental levels in terms of ability to differentiate and integrate reality; (b) are in response to external rather than internal physiological cues; (c) had life histories characterized by strong ambivalent parental feelings about the child's survival, and by use of food as a vehicle of relationship so that feeding and eating became equated with doing; (d) were characterized by reduced motility as an important aspect of development; and (e) had, in all but 4 cases, regained or exceeded their admission weight 24 mo. postfast. Various differences between high and low gainers during follow-up and the implications of an unexpected finding, i.e., the incidence of deaths of significant people shortly before a child agreed to total fast, are discussed. (21 ref.)—M. Maney.

8850. Nelson, Robert F. (U. Ottawa, Medical School, Ontario, Canada) **Cluster migraine: An unrecognized common entity.** *Canadian Medical Association Journal*, 1970(Nov), Vol. 103(10), 1026-1030.—Reviews vascular headache and emphasizes its stereotyped features. 10 case histories are given and the need for early diagnosis is emphasized. While the common analgesics and narcotics are usually ineffective, ergotamine derivatives, methysergide and a new compound, BC-105, are highly effective forms of therapy. (19 ref.)—*Journal abstract.*

8851. Petroni, Frank A. (Menninger Foundation, Div. of Social Science Research, Topeka, Kan.) **Social class, family size, and the sick role.** *Journal of Marriage & the Family*, 1969(Nov), Vol. 31(4), 728-735.—Examined illness frequency, physician utilization, and perceived legitimacy to the sick role in relationship to socioeconomic status (SES) and family size. A household respondent in each unit from 67 3-generation families was interviewed quarterly over 1 yr. SES and family size were inversely related to perceived right to assume the

sick role. However, SES was not significantly related to the frequency of reported illnesses or physician utilization. In contrast, the latter were inversely related to family size. The association between illness behavior and family size was specified when controlling for age (generation) and social class. Family size was inversely related to both illness frequency and doctor visits in the lower class, but not in the middle class, or among respondents in the grandparent generation.—*Journal abstract.*

8852. Rinaldi, Guillermo & Goldberg, Diana. **Preparación psicoterapéutica en cirugía cardiovascular infantil.** [Psychotherapy preparation for pediatric patients at cardiac surgical treatments.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969(Mar), Vol. 15(1), 66-74.—Emphasizes the importance of psychotherapy as a preparation for pediatric patients undergoing surgical treatment for cardiac diseases. The outstanding characteristics of the children's personalities are described as well as those of the family groups, emphasizing the group's effort to make up for the child's handicap. It is also shown how that balance is broken at the repairing surgical procedure and how this situation may be therapeutically handled. The technique used is based on child psychoanalysis adapted as a short-term therapy.—*English summary.*

8853. Shatin, Leo. (334 Warwick Ave., South Orange, N.J.) **The Situational Attitudes Schedule: A morale scale for the chronic medical patient.** *American Corrective Therapy Journal*, 1970(Sep), Vol. 24(5), 137-140.—Describes a brief Situational Attitudes Schedule to study the psychological state of morale of long-term hospitalized medical patients. The Schedule is concise, requires but simple reading ability, and can be self-administered or administered by paramedical personnel. Its parallel and correspondent changes are reported, *pari passu*, with the changes on a Ward Behavioral Rating Scale and an Activities Participation Index in a re-motivation study of chronic hospitalized medical patients. The scores on the Situational Attitudes Schedule changed coordinately with changes in the patients' ward behavior, social adjustment, and degree of cooperative participation in voluntary and rehabilitation activities. This morale scale is applicable to evaluational studies of rehabilitation methods with hospitalized chronic medical patients.—*Author abstract.*

8854. Van Melkebeek, A. & de Barsy, A. M. (Inst. Bunge, Antwerp, Belgium) **A propos d'un Inconvénient rare, mais dramatique, de l'utilisation du diazépam intraveineux.** [A rare but severe complication arising from the intravenous use of diazepam.] *Acta Neurologica Belgica*, 1970(Mar), Vol. 70(2), 286-294.—Reports the cases of 2 children (ages 8½ and 4) who developed apnea after an iv injection of valium; dosages were respectively 7.5 and 5 mg. These attacks of apnea required assisted respiration for a period of about 15 min. (2 p. ref.)—*English abstract.*

8855. Zacharski, Leo R., Litin, Edward M., Mulder, Donald W., & Cain, James C. (Dartmouth Coll., Medical School) **Acute, fatal hepatic failure presenting with psychiatric symptoms.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 382-386.—Describes 2 patients who had rapidly progressive and ultimately fatal liver disease but initially manifested only psychiatric symptoms. In neither was there any suggestion of liver disease in the history or in the clinical data until shortly before death. (15 ref.)—*Journal abstract.*

COMMUNITY SERVICES

8856. Cutting, Allan R. (Family & Child Guidance Services, Brattleboro, Vt.) **An approach to community mental health education.** *Social Casework*, 1970(Oct), Vol. 51(8), 475-480.—Establishing a special educational advisory committee for a community mental health center appeared to be more effective than collaborating with a mental health association. The advisory committee included representation by minority and poverty groups and allowed members to rank-order community needs.—M. W. Linn.

8857. Gruenberg, Ernest M. & Huxley, Judith. (Columbia U., Coll. of Physicians & Surgeons) **Mental health services can be organized to prevent chronic disability.** *Community Mental Health Journal*, 1970(Dec), Vol. 6(6), 431-436.—Discusses the "social breakdown syndrome" in which deterioration occurs in some persons with chronic severe mental disorders. It is suggested that comprehensive mental health services in the community form a base for dealing with patients who have developed this syndrome. The relationship between in- and outpatient services is discussed. A guideline questionnaire is provided to help communities determine their capacity to prevent chronic deterioration in such individuals. It is concluded that at least 1/2 of chronically deteriorated persons could be rehabilitated if present knowledge was effectively applied.—*Journal abstract*.

8858. Katz, Alfred H. (U. California, Schools of Public Health & Social Welfare, Los Angeles) **Self-help organizations and volunteer participation in social welfare.** *Social Work*, 1970(Jan), Vol. 15(1), 51-60.—Presents a theoretical analysis of the dynamics of self-help groups, with special reference to the dimensions of volunteer participation. It is concluded that self-help organizations will continue to provide extensive opportunities for 1 important type of volunteer service, and that social scientists and social welfare students should increasingly utilize the rich laboratory setting provided by these organizations for the study of organizational behavior and small social systems and for analysis of pertinent and inventive volunteer participation.—*Journal abstract*.

8859. Lightfoot, Orlando B. & Foster, Douglas L. (Harvard Medical School, Boston, Mass.) **Black studies, black identity formation and some implications for community psychiatry.** *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 751-755.—Defines black studies as being of, by, and about black people, occurring in multiple areas, including black homes, black communities, and academic departments of black studies. Black identity is seen as a function of the socio-cultural reality of the times. Community psychiatry can be useful in the process, but leadership in such programs must be assumed by blacks.—*Journal abstract*.

8860. Osofsky, Howard J. & Osofsky, Joy D. (State U. New York, Upstate Medical Center, Syracuse) **Adolescents as mothers: Results of a program for low-income pregnant teenagers with some emphasis upon infants' development.** *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 825-834.—Reports the results of an interdisciplinary program for 460 low-income pregnant adolescent girls and their babies. Medical complications, prematurity, and prenatal mortality were considerably reduced. Ss made considerable educational progress despite poverty, prior school deficiencies, and responsibility for child care. Many

graduated from high school and continued for higher education. The availability of sex education and contraception greatly reduced the incidence of unwanted repeat pregnancies. Many Ss left local welfare rolls. Base-line information is provided on the physical growth and development of the infants and on the interaction of young mothers and their infants. (39 ref.)—*Journal abstract*.

8861. Ozarin, Lucy D. (National Inst. of Mental Health, Div. of Mental Health Service Programs, Chevy Chase, Md.) **Occupational therapy facilities in community mental health centers.** *Hospital & Community Psychiatry*, 1969(Sep), Vol. 20(9), 289-290.

8862. Pörksen, N. (U. Heidelberg/Mannheim, Sociopsychiatric Clinic, W. Germany) **Über Krisenintervention.** [Crisis intervention.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1970(May), Vol. 20(3), 85-95.—The model of crisis intervention is based on the attempt to exploit the therapeutic possibilities by way of immediate active treatment in an acute life-crisis or a crisis during mental illness. It is felt that crises are possible turning points and can be used to achieve mastery of the situation. The danger in crises lies in fear of the necessary confrontation. Many crisis consultation centers are being established in the United States, either as independent institutions or as crisis wards in community mental health centers. These centers are always open and are located in downtown areas. Therapeutic possibilities and personal experiences with these centers are discussed. (16 ref.)—*English summary*.

8863. Riessman, Catherine K. (Paret Lane, Hartsdale, N.Y.) **The supply-demand dilemma in community mental health centers.** *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 858-869.—Critically surveys response strategies that attempt to meet the paradox that as the supply of properly offered services increases, the demand for these services accelerates even faster. This new level of demand cannot be met by the present allocation of resources. Case material from 1 center is highlighted. (29 ref.)—*Journal abstract*.

8864. Robertson, Richard N., Maholick, Leonard T., & Shapiro, David S. (Bradley Center, Columbus, Ga.) **The parish minister as counselor: A dilemma and challenge.** *Pastoral Psychology*, 1969(Jun), Vol. 20(195), 24-30.—Genuine community action for prevention and amelioration of mental and social ill health depends upon society's ability to engage the key helping professions in such programs. Parish ministers comprise an unusual reservoir of time, energy, skill, and wisdom in this project. Preparation of the parish minister, however, requires a different viewpoint and a different body of knowledge than that required for training of a pastoral counseling specialist.—O. Strunk.

8865. Schulberg, Herbert C. & Baker, Frank. (Harvard Medical School, Boston, Mass.) **The caregiving system in community mental health programs: An application of open-systems theory.** *Community Mental Health Journal*, 1970(Dec), Vol. 6(6), 437-446.—Discusses the rapid expansion of community mental health programs which is focusing increased attention upon the problems of organizing effective caregiving networks. Concepts drawn from open-systems theory are applied to this issue by exploring the primary task, the nature of inputs and outputs, environmental conditions, and subsystem interactions as they affect a community mental health program. The differences between programs organized according to medical practice and

human services models are also explored within this framework. (19 ref.)—*Journal abstract*.

8866. **Taber, Richard H.** (Philadelphia Child Guidance Clinic, Pa.) **A system approach to the delivery of mental health services in black ghettos.** *American Journal of Orthopsychiatry*, 1970(Jul), Vol. 40(4), 703-709.—Inhabitants of a black ghetto live with several pervasive mental health problems, poor self-image and the concomitant sense of powerlessness. From the concept of ecological systems, this pathology is seen as the outcome of transactions between the individual ghetto dweller and his surrounding social systems. This paper describes a project that attempted to deal with the pathology among black ghetto inhabitants through intervention in 2 natural social systems—an adult social network and a teenage gang—without requiring Ss to perceive themselves as patients. The goal was to develop models for the delivery of services which brought about changes in the existing systems, focusing on competence and mutual support rather than pathology.—*Journal abstract*.

8867. **Thomson, Captane P.** (Yolo County Mental Health Services, Woodland, Calif.) **Involving the private sector in community psychiatry.** *American Journal of Psychiatry*, 1970(Sep), Vol. 127(3), 363-368.—Offers 1 answer to the question of how psychiatry can expand its capacity for direct service if a national health insurance program removes the financial barrier to care. The cooperative development of a central inpatient, day patient, and emergency service is also described that eliminates the distinction between public and private care and makes maximum use of scarce professional manpower.—*Journal abstract*.

8868. **Torrey, E. Fuller.** (National Inst. of Mental Health, Div. of Manpower & Training, Chevy Chase, Md.) **Mental health services for American Indians and Eskimos.** *Community Mental Health Journal*, 1970(Dec), Vol. 6(6), 455-463.—Surveys past and present mental health services for American Indians and Eskimos and finds them to be inadequate. A plan is outlined for the development of such services based upon a cooperative rather than a paternalistic venture with these minority groups. The plan is based upon the use of indigenous therapists for individual and group psychotherapy, the modification of etiological beliefs, and an emphasis upon primary prevention. The Alaskan Eskimo is used to illustrate how these principles could be put into effect. The outcome would be a system of mental health services specifically adapted to the culture, realistically commensurate with available manpower, and compatible with dignity for the group. (18 ref.)—*Journal abstract*.

GERIATRICS

8869. **Daniel, R.** (Wolston Park Hosp., Brisbane, Queensland, Australia) **Psychiatric drug use and abuse in the aged.** *Geriatrics*, 1970(Jan), Vol. 25(1), 144-158.—Presents a clinical impression of problems in the use of drugs in the aged. Correct diagnosis is of great importance since many of the mental symptoms of confusion may be the result of underlying physical illness. Thorough physicals with special attention to cardiac, respiratory, and renal symptoms are recommended. 10 brief case histories are presented to support this suggestion. Further studies with 50 male patients are used to indicate proper administration and dosage of various drugs: phenothiazines, diazepam and oxazepam,

imino-benzene derivatives, barbiturates, phenytoin, and cerebral arteriodilators. Contraindications and side effects are discussed.—*S. Knapp*.

8870. **Killian, Eldon C.** (Stockton State Hosp., Calif.) **Effect of geriatric transfers on mortality rates.** *Social Work*, 1970(Jan), Vol. 15(1), 19-26.—Reports on a study to determine the effect of transfers on the mortality rate of geriatric psychiatric patients. Variables studied were age, sex, race, organic or functional diagnosis, length of hospitalization, and whether Ss were ambulatory at the time of transfer. Mortality rates were significantly higher for the transfer group (N = 144)—especially for the older, nonambulatory patients—than for those Ss (N = 109) who had remained in their home units. The need to establish policies that keep the Ss' interests firmly in mind and that are cognizant of the effects of environmental change, especially on the aged, is emphasized.—*Journal abstract*.

8871. **Post, Felix.** (Bethlem Royal Hosp., London, England) **Management of senile psychiatric disorders.** *British Medical Journal*, 1968(Dec), Vol. 4(5631), 627-630.—Emphasizes early diagnosis and cooperation between the family doctor, local authority health and social services, and the geriatrician and psychiatrist in the treatment of senile psychiatric disorders. The types of problems manifested by elderly patients are presented and the treatment for each type is discussed. Sexual problems, alcoholism, hypochondriasis, affective illness, suicidal ideas, persecutory states, and organic mental disorders are included.—*G. Steele*.

8872. **Wallen, Vincent.** (Veterans Administration Hosp., Psychology Service, Hampton, Va.) **Motivation therapy with the aging geriatric veteran patient.** *Military Medicine*, 1970(Nov), Vol. 135(11), 1007-1010.—65-94 yr. old geriatric patients were placed in a group therapy setting which emphasized giving direction and meaning to the lives of geriatric patients. The main goal of this program was to give the patients an alternative to continuous hospital care and provide for posthospital placement in a desirable facility for each patient. 80% of the patients who were in the program were being placed in such facilities within 7 mo. of the beginning of the program. Family attitudes towards geriatric patients were seen as the most important drawback to successful placement inasmuch as these patients had frequently been inadequate parents whose children were now uninterested in giving them the needed attention.—*G. A. Chum*.

8873. **Weiss, William U.** (U. Maryland) **A study of some characteristics of individuals who remain in an institution for the aged.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 906-907.

EDUCATIONAL PSYCHOLOGY

8874. ———. **Institute for Educational Research and Studies.** Tehran, Iran: National Teachers' Coll., 1968. 47 p.

8875. **Altbach, Philip G. & Graham, Robert.** (U. Wisconsin) **Student politics and higher education in the United States: A select bibliography.** St. Louis, Mo.: United Ministries in Higher Education, 1968. vi, 86 p. \$2(paper).

8876. **Angelini, Arrigo L.** (U. São Paulo, Brazil) **Educational technology and television in Brazil.** *Revista Interamericana de Psicología*, 1970(Mar), Vol.

4(1), 59-68.—Presents recent developments in the areas of technology and education through educational TV. It is suggested that this form of mass communication will (a) increase the availability of educational resources for the public, (b) benefit the lower economic levels who cannot afford TV, (c) attack illiteracy on a wider base, (d) improve Brazilian manpower, (e) provide needed training and development of teaching personnel, (f) substitute as a medium for schools, and (g) further cultural exposure. Problem areas for educational TV are lack of funds and adequately trained personnel. (Spanish & Portuguese summaries)—*H. Lohn*.

8877. **Atherton, P. J.** (U. Alberta, Edmonton, Canada) **Financing post-secondary education in Alberta.** *Alberta Journal of Educational Research*, 1970(Sep), Vol. 16(3), 137-148.—The basis of financing junior colleges in Alberta, Canada, is a per-student grant. The problem of whether or not this type of grant, which provides a measure of fiscal equity, would provide the necessary flexibility for developing institutions was studied. A program cost analysis was conducted for junior colleges in Alberta. The resulting cost data showed a wide difference in the cost per student for similar programs in each college. The reasons for the differences are analyzed and discussed and a type of financing system based on program budgeting and budget approval is recommended.—*Journal abstract*.

8878. **Elbow, Peter H.** (Massachusetts Inst. of Technology) **More accurate evaluation of student performance.** *Journal of Higher Education*, 1969(Mar), Vol. 40(3), 219-230.—Proposed that universities adopt a multifactor grading grid to replace the traditional A-F system with its indeterminacy and ambiguity, in order for the teacher to provide substantive information and force interpreters to assign their own values. An experimental semester is suggested, during which a list of factors could be evaluated and decided upon by a faculty. Under the proposed system the universities would be better able to satisfy the desire of outside groups to know the strengths and weaknesses of a student's academic performance.—*T. N. Webster*.

8879. **Engelbrecht, C. S.** (National Bureau of Educational & Social Research, Pretoria, South Africa) **School-leavers: The most important findings with regard to: The identification of pupils upon leaving school and the follow-up of pupils after leaving school.** Pretoria, South Africa: National Bureau of Education & Social Research, 1968. iv, 36 p.

8880. **Gagné, Robert M.** **A systems approach to adult learning.** *Washington University Department of Psychology Technical Report*, 1968, No. 15, 1-14.—Tests the hypothesis that "the engineering logic of systems design and development could be successfully applied to the design of a system for adult learning." The problem of adult learning is examined, emphasizing the lack of direction. Following the determination of broad goals or system outcomes, the system design includes the subsystem functions, "allocation of functions within subsystems," and identification of components. Plans for system operation and testing are included. Results support the hypothesis. Adult and childhood learning involving basic skill, knowledge acquisition, and productive thinking are compared "to define the kinds of instructional objectives to be achieved by adult learning."—*G. Steele*.

8881. **Gusev, I. T., Mukhin, E. V., & Sumarov, L. N.** (Engineering Physics Inst., Moscow, USSR) **O**

metodologicheskikh printsipakh primeneniya kolichestvennykh metodov pri issledovanii uchebnogo protsessa v vuze. [On the methodological principles of applying quantitative methods in the study of the educational process in higher institutions of learning.] *Programmirovannoe Obuchenie*, 1969, No. 4-5, 14-22.—*I. 8882. **Kolominskii, Ya. L.** **Psikhologiya lichnykh vzaimootnoshenii v detskom kollektive.** [Psychology of personal interrelationships in the child collective.] Minsk, USSR: Narodnaya Asveta, 1969. 240 p.—Presents a book on the social psychology of the classroom, describing methods for the study of those interpersonal relationships among children which affect the development of personality, behavior, and school performance. Results of the author's research, analyses, and practical recommendations are presented.—*I. D. London*.

8883. **Lu, Chun-yo.** (National Taiwan U., Taipei) [A study on personality traits of freshmen at the National Taiwan University.] *Acta Psychologica Taiwanica*, 1970(Mar), Vol. 12, 1-6.

8884. **Moldavskaya, S. I. & Glukhovskii, L. M.** (Bogomolets Inst. of Physiology, Kiev, USSR) **Opyt psikhofiziologicheskogo obosnovaniya normativov trudoeffektivnosti uchebnoi raboty studentov.** [An experiment to develop psychophysiological grounds for setting the norms of work-expenditure for the schoolwork of students.] *Programmirovannoe Obuchenie*, 1969, No. 4-5, 57-63.—Examined the problems encountered in developing norms for work-expenditure in higher schoolwork, and psychophysiologicaly evaluated the statistical data in an experiment attempting to develop norms for the educational work load contemplated. The influence of learning activities on the functional state of the cerebral cortex was studied by means of various psychophysiological methods. It was shown that the character of action of the educational work load is a function of the typological features of the nervous system of the student. The norms that had been previously developed were shown to be physiologically admissible for students with a strong type of nervous system, but too much for students with the weak type.—*I. D. London*.

8885. **Novikova, Ljudmila I. & Lewin, Aleksander.** (Academy for Pedagogical Sciences, Research Inst. for the Theory & History of Education, Moscow, USSR) **The collective and the personality of the child.** *International Review of Education*, 1970, Vol. 16(3), 323-341.—The problem of collective education represents 1 of the central problems in the socialistic theory of education and its practical application. Social school pedagogues regard the collective as an indispensable means for the education of the new generation, both for their social experiences and the development of the individuality of the child. The collective influences the child and tries to integrate the family, school, clubs, etc., into the overall concept of the collective.—*R. F. Wagner*.

8886. **Puni, A. Ts.** **Psikhologicheskaya podgotovka k sorevnovaniyu v sporte.** [Psychological preparation for athletic competition.] Moscow, USSR: Fizkul'tura i Sport, 1969. 88 p.—Discusses the psychological preparation for maximal performance in athletic competitions, which is based on anecdotal and experimental materials, viewed as both a psychological and pedagogical problem.—*I. D. London*.

survey of American studies. *Higher Education Monograph Series*, U. London, 1969, No. 1, 42 p.

8888. Schulman, Lee S. (Michigan State U.) **Reconstruction of educational research.** *Review of Educational Research*, 1970(Jun), Vol. 40(3), 371-396.—Considers the study of environments and the reconstruction of research strategy. Educational research has been attempted without notable success. But from its often clumsy gropings have emerged general strategies and approaches that could show promise for the future. The structure of the educational research establishment must be significantly modified to create the necessary conditions for research in education. (3 p. ref.)—P. D. Leedy.

8889. Taukach, G. L. & Lisovichenko, V. I. (Construction Engineering Inst., Kiev, USSR) **Itoqi nauchno-pedagogicheskogo eksperimenta po razrabotke sistemy planirovaniya i organizatsii uchebnogo protsessa v vuze.** [Summarization of the findings of a scientific-pedagogical experiment on the development of a system for planning and organizing the educational process in higher institutions of learning.] *Programmirovannoe Obuchenie*, 1969, No. 4-5, 33-52.—Presents an analysis of the general principles underlying the development of this system. A 3-yr experimental effort led to the development of a "normative base," supported by "statistical and psychophysiological" data.—I. D. London.

ATTITUDE & ADJUSTMENT

8890. Brown, Robert E. (Michigan State U.) **Analyses of attitude changes in adults after participation in a conservation-oriented biology course.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1073.

8891. Cheong, George S. (Mt. Allison U., Sackville, New Brunswick, Canada) **Acquisition of experimental attitude by young children.** *Alberta Journal of Educational Research*, 1970(Sep), Vol. 16(3), 157-163.—Attempted to determine whether or not a group of youngsters who were taught by teachers high in experimental attitude would be more experimental in attitude than a group of youngsters who were taught by teachers low in experimental attitude after 1 academic yr. Differences between the groups were not statistically significant. Related findings of the study were: (a) teachers high in experimental attitude, as determined by a self-report instrument, were perceived by pupils to be significantly higher in this than were teachers who described themselves as low in experimental attitude; (b) youngsters who were taught by teachers low in experimental attitude were significantly more discrepant or dissatisfied than youngsters who were taught by teachers high in experimental attitude; and (c) according to pupils' self-perception and their perception of teachers, the pupils were significantly higher in experimental attitude than were the teachers.—*Journal abstract.*

8892. de Kort, A. **Drop-outs bij het leerlingwezen.** [Drop-outs among the learners.] *Mens en Onderneming*, 1970(Sep), Vol. 24(5), 280-295.—Presents a descriptive-exploratory investigation of the conditions that resulted in the dropout of students from the apprentice schools (lower technical school). The data were obtained from the case studies of 16 dropouts from the lower technical school, 11 vocational advisers, and 3 district supervisors. An analysis of the purported reasons of "disinterest in school" and "school weariness" among the dropouts

indicated: a higher income in industries without a lower technical school, no apparent reward for obtaining a diploma from this type of school, the curricular content of the school was not exactly pertinent to industrial success, and dismissal from the school. As the labor history of the dropouts was not significantly less desirable than the careers of the graduates, suspicion is created about the effectiveness of lower technical school's programs. Recommendations are made to improve the programs, both administrative and didactic.—A. J. Ter Keurst.

8893. Dufoyer, J. P. (Sorbonne, Genetic Psychology Lab., Paris, France) **Sanction des études: Valeur et usage des notes: Enquête auprès d'étudiants en psychologie.** [Confirmation of studies: Value and use of marks: Survey of psychology students.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(1-3), 72-80.—Questioned 233 2nd-yr Sorbonne students as to their opinion on confirmation methods (final exams, interm exams, continuous marking). 91.5% considered marks useful, continuous marking the best system (76%, as compared with final exams, 2.9%, interm exams, 19.8%), with continuous marking the best system with respect to motivating study and avoiding irregularities found in exams. Ss thought the marks themselves, however, should be supplemented by broader and more complete evaluations. Below 8-20 (on a 0-20 marking scale) was considered a poor mark; above 12-20, good; only 1/3 of the Ss thought their instructors shared this opinion. Most thought the 0-20 scale should be used in its entirety, with statistical methods used to neutralize corrector variations. Group marks for group studies were favored, even if counted toward diplomas. With respect to continuous marking, Ss were divided in specifying whether all marks or only a part should be considered. In the language of instructors and Ss the term "continuous marking" is rapidly being substituted for that of "continuous assessment of knowledge," a deviation which, if it increases, will tend to produce a "race for marks" or "good marks," so as to reduce the true meaning of learning oriented toward the acquisition of knowledge and methods.—T. N. Webster.

8894. Farley, Jennie. (Cornell U.) **Graduate women: Career aspirations and desired family size.** *American Psychologist*, 1970(Dec), Vol. 25(12), 1099-1100.—Reports results of a questionnaire answered by 263 female graduate students at a large university. The majority were single and in their 1st or 2nd yr. Respondents indicated the relative importance of having a career. Those who checked "very important" were classified as "career women" (approximately 50%). It was hypothesized that career women would more likely anticipate conflict between the career goal and marriage and would differ from noncareer women in terms of various expectations. Results indicate that a higher percentage of career than noncareer women expected (a) to have 2 or less children, (b) that the husband would have equal responsibility for housework and child care when she was working, (c) not to give priority automatically to husband's career, and (d) to work full-time even with preschool children. Neither group, however, anticipated much conflict between career and marriage.—P. McMillan.

8895. Fiebert, Martin S. (California State Coll., Long Beach) **A scale to measure the social distance between college students and faculty.** *Journal of Psychology*, 1971(Jan), Vol. 77(1), 3-7.—Developed a

10-item scale constructed from the perspective of college students to assess the dimension of student-faculty social distance. The scale was administered to 507 students who judged each item with respect to their typical and desired levels of social distance. Results indicate that students significantly preferred a lower level of distance than they usually experienced with their instructors. It was found that older and higher achieving Ss, experienced a lower level of social distance.—*Journal summary.*

8896. Grác, Jan. (Comenius U., Bratislava, Czechoslovakia) **Spokojnosť a nespokojnosť a jej podoba u študujúcej mládeže.** [Content and discontent and their forms in students.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(2), 99-118.—Based on results from 1783 Polish high school and university students using the method of exploratory feedback record, the forms of contentment and discontentment and their relationship to the Ss' reaction to questions concerning the contents of their life as students were studied. It was unexpectedly found that: (a) Ss tended to be more often contented than discontented with regard to direct and indirect questions concerning school life; (b) Ss were least worried about problems of material and financial security and questions about social relationships; and (c) Ss were most concerned about problems of self-realization and questions of methodically and technically managing their individual self-education, and above all, mastering their study schedules. The research procedure and results are interpreted circumstantially and explained psychologically. (Russian summary)—*English summary.*

8897. Hauck, Robb J. & Stewart, Maude A. (Buena Vista Coll.) **College men and the draft: 1969.** *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 439-444.—Attempted to determine whether student attitudes toward military service have changed since 1967 and what the reactions of students at Ohio State University are with regard to draft resistance. No differences were obtained between each of the undergraduate classes. However, a greater negativism was manifested by graduate students as well as undergraduates since 1967. There was a moderate concern about serving in the military with some 70% of the students feeling little or no guilt about not being involved. The disruption of personal plans continues to exert a strong influence on present attitudes. Also, seemingly contradictory to the other findings, an attitude change reflecting a more positive judgment toward a man's duty to serve his nation was noted. Finally, moral reasons and illegality of the Vietnam war were the major reactions concerning resistance to the draft.—*R. H. Mueller.*

8898. Hull, W. Frank. (U. Toledo, Center for the Study of Higher Education) **The black student in higher education: A bibliography.** *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 423-425.—Presents an annotated bibliography of recent publications which are concerned with the black student in higher education: who he is, what he wants, what the university can do, and what the university should refrain from doing. (29 ref.)—*R. H. Mueller.*

8899. Karasick, B. et al. (Purdue U., Measurement & Research Center) **High school students look at current political issues and the 1968 Presidential campaign.** *Purdue Opinion Panel Poll Report*, 1967(Nov), Vol. 27(1), 20 p.—Administered a questionnaire on attitudes toward the United Nations,

international relations, atomic energy control, Presidential politics, and current domestic issues to 20,000 high school students. Results indicate the majority of "boys prefer the Republican party, girls earn superior grades, and considerable sex differences exist in future plans." Differences in position on questions regarding the powers, stature, and policies of the United Nations; international relations and atomic energy; Presidential candidates; and civil rights, gun control laws, and the Kennedy assassination correlate with education of mother, class level, grade average, and college plans. The validity of the poll is discussed.—*G. Steele.*

8900. Miller, Derek. (University Hosp., Neuropsychiatric Inst., Ann Arbor, Mich.) **Adolescents and the high school system.** *Community Mental Health Journal*, 1970(Dec), Vol. 6(6), 483-491.—Studies the social organization of high schools and questions whether the structures of the social systems meet the developmental needs of adolescents. The need for schools to change to meet these needs is enhanced because the breakdown of the social networks of society have made schools the only stable psychosocial developmental area for many pupils. Adolescents are considered in their early and middle stages, and the specific needs of these age groups are related to the social organization of the school. In particular, the size of the school, the change in ages of children from school to school, and the structure of groups are considered. Necessary changes for improvement in teacher-pupil relationships are discussed.—*Journal abstract.*

8901. Ochberg, Frank M. & Trickett, Edison. (National Inst. of Mental Health, Chevy Chase, Md.) **Administrative responses to racial conflict in a high school.** *Community Mental Health Journal*, 1970(Dec), Vol. 6(6), 470-482.—Studies the impact of a high school riot on the ecology of the school from the perspective of the vice principal. It is suggested that administrative options and responses were shaped by the organizational history of the school and by relationships among various groups both out- and inside the school: faculty, students, superintendent, board of education, and the black and white communities. Implications for the community mental health consultant are discussed.—*Journal abstract.*

8902. Pate, Robert H. (U. Virginia) **Student expectations and later expectations of a university enrollment.** *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 458-562.—Investigated whether freshmen and transfer students enter the same university with different expectations, whether there is a difference between the perception of the university environment prior to and at the end of the 1st semester on the part of freshmen, and whether any such possible difference is related to familiarity with the university or certain individual characteristics of the student. 300 college students completed 2 instruments designed to measure student perceptions of the university environment. The findings indicate that there is indeed a discrepancy between the expectations and later perceptions of incoming college freshmen. It is suggested that the entering transfer student may be seeking a college that fits his stereotype after being disappointed with his original choice.—*R. H. Mueller.*

8903. Reiley, Robert R. & Knight, Glenn E. (Texas A & M U.) **MMPI scores of Mexican-American college students.** *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 419-422.—Reviews some of the

research concerning racial and regional differences among different samples on the MMPI. This study was interested in determining whether any differences existed between Spanish and non-Spanish freshmen college students at a southwestern university. The MMPI was administered to 136 students. A total of 7 significant differences were obtained out of a possible 36 combinations. Females scored higher on depression and social introversion, while Mexican Ss scored higher than non-Mexicans on the Lie scale, and the reverse was the case on the Paranoia scale. Also, 3 significant differences were obtained in the sex-race interaction. Suggestions are offered for the obtained differences.—*R. H. Mueller.*

8904. **Risch, Thomas J.** (Bucknell U.) **Expectations for the college environment.** *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 463-466.—It was hypothesized that freshmen whose parents had a limited educational background would differ in their expectations from freshmen whose parents had college degrees. 82 students completed the College and University Environment Scales which measure 5 dimensions of the campus environment: practicality, community, awareness, propriety, and scholarship. Results indicate that a multifactor social class distinction, rather than a single factor, e.g., educational level of parents, may be more appropriate to account for differences in student expectations of the college environment.—*R. H. Mueller.*

8905. **Rolf, Jon E.** (U. Minnesota) **The academic and social competence of school children vulnerable to behavior pathology.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1549-1550.

8906. **Schmidt, Marlin R.** (U. Florida) **Personality change in college women.** *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 414-418.—Investigated personality and attitudinal changes by college women from freshman to senior year at a large midwestern university. Over 1000 Ss were initially involved in the study and complete information was available for 314 or about 30% of the women. The instruments used included the American College Survey, the Vocational Preference Inventory (VPI), the Interpersonal Competency Scale, the Rokeach Dogmatism Scale, the Student Orientation Survey, Form C, as well as the measurement of several personality traits and abilities. Ss generally decreased in dogmatism and increased in interpersonal competence. There was also a decrease in most of the VPI scales, while the nonconformist orientation increased. (16 ref.)—*R. H. Mueller.*

8907. **Stensaasen, Svein.** (U. Oslo, Inst. for Educational Research, Norway) **Interstudent attraction and social perception in the school class: An inquiry into the operation of preference for the balanced state among members of the natural classroom group.** *Norwegian Studies in Education*, 1970, No. 3, 282 p.

8908. **Thorn, Philip.** **Interpersonal conflicts in elementary school classes.** *Individual Psychologist*, 1970(Nov), Vol. 7(2), 38-46.—Describes some interpersonal conflicts observed in elementary school situations and analyzes them within the framework of individual psychology.—*A. R. Howard.*

TESTING

8909. **Anderson, Hilton L.** (Rutgers State U.) **Acquiescence response bias to difficult achievement-type true-false tests of male high school students exhibiting rule breaking or rule obeying behavior.**

Dissertation Abstracts International, 1970(Sep), Vol. 31(3-B), 1514-1515.

8910. **Baird, Leonard L.** (Educational Testing Service, Princeton, N.J.) **The relation of vocational interests to life goals, self-ratings of ability and personality traits, and potential for achievement.** *Journal of Educational Measurement*, 1970(Win), Vol. 7(4), 233-239.—Related interests as measured by Holland's Vocational Preference Inventory to (a) 35 life goals, (b) 31 self-ratings of ability and personality traits, and (c) 22 scales measuring potentials for achievement in 3 analyses using canonical correlation. The sample consisted of 20,369 college freshmen in 37 institutions. Results are shown separately for males and females for 5 factors for each analysis.—*Journal abstract.*

8911. **Bratko, A. A.** (Inst. of Psychology, Kiev, USSR) **Razrabotka i primeneniye program standartizovannogo kontrolya.** [Development and utilization of programs for standardized testing.] *Programmirovannoe Obuchenie*, 1969, No. 4-5, 114-120.—Examined the effectiveness of utilizing 4 variants of a program, developed to check on the progress of students of pedagogical institutes in learning general psychology. Multiple-choice answers are shown to have certain practical advantages, and their use is, accordingly, recommended.—*I. D. London.*

8912. **Cox, Richard C. & Sterrett, Barbara G.** (U. Pittsburgh) **A model for increasing the meaning of standardized test scores.** *Journal of Educational Measurement*, 1970(Win), Vol. 7(4), 227-228.—Proposes a model to increase the meaningfulness of standardized test scores that includes the following steps: (a) a precise description of curriculum objectives and a specification of pupil achievement in reference to these objectives; (b) the coding of each item on a standardized test with reference to the curriculum; and (c) the assignment of 2 scores to each pupil, 1 reflecting his achievement on items that test content to which he has been exposed, the other his achievement on items that test content beyond his present status in the curriculum or not represented in the curriculum at all.—*Journal abstract.*

8913. **Dasgupta, Jayanti.** **Traditional grading system and equivalent score technique: A comparison.** *Bulletin of the Council of Social & Psychological Research, Calcutta*, 1967, No. 8, 1-4.—Suggests that the equivalent score technique is a more appropriate system of grading than the traditional composite score technique. Scores of a random sample of 370 male and 130 female candidates in the Bachelor of Arts Examination of an Indian university in 1961 were considered. Vernacular was taken as the standard and the equivalence curves for English, history, Sanskrit, politics, and economics were drawn and best fitted to the empirical data by the method of least square. A random sample of 50 of the 500 Ss was chosen and the composite and equivalent scores determined. The 2 rankings were compared on the calculated p.—*Journal abstract.*

8914. **Ebel, Robert L.** (Michigan State U.) **Knowledge vs. ability in achievement testing.** *Proceedings of the Invitational Conference on Testing Problems*, 1969(Nov), , 66-80.—From the assumption that the essence of achievement is command of useful verbal knowledge, the following implications are listed: (a) most educational objectives should be stated in terms of achieved knowledge or specific abilities rather than desired behavior general abilities or adjustment; (b) ability to think—reflectively, critically, and straight—should be recognized for what it really is in essence, not the

exercise of some general ability; (c) search for the "essential traits of mental life," or for "the dimensions of achievement," should be discontinued; (d) testing in schools should concentrate more on the aspect of "subject matter" or "content" rather than on general abilities; and (e) tests of general educational development which seek to emphasize general abilities are not adequate for testing educational achievement. A discussion by G. C. Gleser follows.—*P. L. Crawford.*

8915. Fialko, E. I. (Kiev U., USSR) **O strukture oprosnoi kartochki.** [On the structure of the question card.] *Programmirovannoe Obuchenie*, 1969, No. 4-5, 132-135.—Proposes that question cards and the questions present a "certain structure," in order to bring about a high degree of reliability in disclosing the student's knowledge. Objective evaluation of depth of knowledge is attained by differentiation of the questions with respect to their character.—*I. D. London.*

8916. Fialko, E. I., Rzhetskiĭ, N. N., & Kuznetsova, A. V. (Kiev U., USSR) **O nekotorykh rezul'tatakh eksperimenta po mnogozvennoi metodike kontrolya znaniĭ.** [On some results of an experiment utilizing the multilink method for testing knowledge.] *Programmirovannoe Obuchenie*, 1969, No. 4-5, 121-126.—Presents a new method of multilink testing of knowledge learned. The method is distinguished by the fact that, in response to each test question, the pupil gives several answers confirming his mastery of the study material.—*I. D. London.*

8917. Fischer, Frederic E. (State U. New York, Oswego) **Some properties of the personal biserial index.** *Journal of Education Measurement*, 1970(Win), Vol. 7(4), 275-277.—The personal biserial index is a correlation which measures the relationship between the difficulty of the items in a test for the person, as evidenced by his passes and failures, and the difficulty of the items, as evidenced by group-determined item difficulties. Properties of the personal biserial index were studied empirically, including an examination of the reliability of the index and the effect of using the index as a predictor of college success. Findings show that the reliability of the index is quite low and that a knowledge of the index does not significantly increase the predictability of college success from Scholastic Aptitude Test scores and high school averages. Evidence supports the hypothesis that the personal biserial index is sensitive to variations in the extent to which examinees guess.—*Journal abstract.*

8918. Geensen, M. (State U., Leyden, Netherlands) **ABV-scores van aankomende studenten.** [ABV-scores of entering students.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Jul), Vol. 25(7), 464-468.—The Amsterdam Biographical Questionnaire (ABV) was administered to 644 students entering the University of Leiden. Their prospective majors were medicine, psychology, chemistry, and law. The ABV, a translation of the MPI, tested neuroticism, neuroticism with a somatic basis, social extroversion, and test attitude. The scores were compared with the norms established by Wilde. The scores above the 64th percentile were in the area of neuroticism. It is suggested that the stressful conditions in which the students operate today could have contributed to their neuroticism.—*A. J. Ter Keurst.*

8919. Kavenagh, Joan C. (New York U.) **Achievement test performance as a function of the interaction between test anxiety and cognitive style in**

elementary school boys. *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1540.

8920. Košč, Ladislav. **Psychologické otázky známkovania žiakov.** [Psychological questions of pupils' evaluation.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(2), 131-145.—Investigates psychological problems of giving school marks, and assessment by means of educational (scholastic achievement) tests and psychological (ability and personality) test methods. The advantages and disadvantages of various forms of evaluation and the necessity of their use in combination, resulting in a complex assessment in conformity with cumulative ratings of pupils are also studied. Some of the more concrete data are illustrated using findings from research concerned with the level and quality of mathematical abilities in pupils. (Russian summary) (21 ref.)—*English summary.*

8921. Rellas, Archie J. (Pasadena Unified School District, Calif.) **The use of the Wechsler Preschool and Primary Scale (WPPSI) in the early identification of gifted students.** *California Journal of Educational Research*, 1969(May), Vol. 20(3), 117-119.—26 5.8-6.7 yr. old students (9 boys, 17 girls) who had scored above 130 on the Weise Predictability Scale, were individually tested on the Form L-M of the Stanford-Binet and on the WPPSI. All testing was done during regular school hours. IQ scores on the Stanford-Binet were higher than the Full Scale IQ scores on the WPPSI in all 26 cases. The mean difference was 17.03, $T = 5.51$ significant at the .001 level. The advisability of using the WPPSI for the early identification of gifted students is limited by its low ceiling and lack of agreement with the Stanford-Binet. Conclusions were limited due to the small sample used.—*H. J. McWhinnie.*

8922. Slakter, Malcolm J., Koehler, Roger A., & Hampton, Sandra H. (State U. New York, Buffalo) **Learning test-wiseness by programmed texts.** *Journal of Educational Measurement*, 1970(Win), Vol. 7(4), 247-254.—Randomly assigned 84 male and 77 female, high school seniors to 1 of 2 treatment groups. 1 group received a programed text designed to teach Ss to answer every item on an examination, whether or not the directions included a penalty for incorrect answers. The other group was administered a programed text to teach certain selected aspects of test-wiseness. Each group served as the control group for the other. The following day all Ss were administered a measure of willingness to guess and a measure of test-wiseness. 2 wk. later, all Ss received additional measures of willingness to guess and test-wiseness. Analysis of the data indicates the group that received the guessing program answered significantly more items than its control group (on both the immediate and delayed tests), even though there was a penalty for incorrect answers. In similar fashion, the group exposed to the test-wiseness program achieved significantly higher mean test-wiseness scores than its control group. (22 ref.)—*Journal abstract.*

SPECIAL EDUCATION

8923. Brauchlin, Eleonora. (42 Englischviertelstr., Zürich, Switzerland) **Das Spiel in der Heilpädagogik als therapeutisches Hilfsmittel.** [Play activities as a therapeutic adjunct to special education pedagogy.] *Heilpädagogische Werkblätter*, 1970(Sep), Vol. 39(5), 232-240.—Authorities have stated that play activities are a necessity for the life and development of the child.

Inability to play shows developmental disturbances or misdevelopment. Frequently, mistakes in educating children destroy the play spontaneity in children. Mentally retarded children have a reduced ability to play. "Play-damaged" children can only be cured through play therapy where anxiety and aggression are reduced.—R. F. Wagner.

8924. Feitelson, Dina. (Hebrew U., John Dewey School of Education, Jerusalem, Israel) **Teaching reading to culturally disadvantaged children.** *Reading Teacher*, 1968(Oct), Vol. 22(1), 55-61.—Collected data in Israel between early 1950s and the present time. The problems faced by Israeli children are fairly typical of problems of children of other cultural subgroups throughout the world, and also in the large urban centers of the United States. 1 of the principal obstacles to successful involvement with a prolonged learning task is the inability of many culturally disadvantaged pupils to defer gratification and short attention span. These militate against teaching reading to the culturally disadvantaged.—P. D. Leedy.

8925. Lustman, Seymour. **Cultural deprivation: A clinical dimension of education.** *Psychoanalytic Study of the Child*, 1970, Vol. 25, 483-502.

8926. Lyapidevskii, S. S. *Nevropatologiya*. [Neuropathology. (4th ed.)] Moscow, USSR: Prosveshchenie, 1969. 336 p.—Presents a textbook on the "natural scientific foundations of special education" for defectological departments in Soviet pedagogical institutes.—I. D. London.

8927. Morrison, Coleman & Harris, Albert J. (City Coll., City U. New York, Office of Research & Evaluation) **Effect of kindergarten on the reading of disadvantaged.** *Reading Teacher*, 1968(Oct), Vol. 22(1), 4-9.—Taught disadvantaged Negro children to read by 2 approaches: the skills centered and the language experience approaches. Comparisons between the approaches revealed a significant difference favoring language experience kindergartners over skills centered kindergartners on both Word Knowledge and Reading tests. The differences for nonkindergarten children within the approaches, while favoring the skills centered children, were not significant.—P. D. Leedy.

8928. Reynolds, Maynard C. (U. Minnesota) **Categories and variables in special education.** *Augustana College Library Occasional Paper*, 1968, No. 9, 16 p.

8929. Scott, Thomas J. (Children's Hosp. & Rehabilitation Center, Utica, N.Y.) **The use of music to reduce hyperactivity in children.** *American Journal of Orthopsychiatry*, 1970(Jul), Vol. 40(4), 677-680.—Found that hyperactivity of 4 boys aged 7-11 yr. diminished when background music was introduced into their study booths with each under a different condition, e.g., a "normal" classroom situation, and music played in the background. A Friedman Two-Way Analysis of Variance reveals the observed differences among conditions are significant at the .03 level.—*Journal abstract*.

8930. Thomas, Elizabeth C. & Yamamoto, Kaoru. (U. Virginia) **School-related perceptions in handicapped children.** *Journal of Psychology*, 1971(Jan), Vol. 77(1), 101-117.—Administered a semantic differential to 500 middle school and high school retarded, disturbed, blind, and deaf children to study their attitudes toward 4 people (classmates, parent, teacher, and myself) and 4 curricula (social studies, language, science, and mathematics). Significant handicap effects were found on all concepts indicating no monolithic handicap group exists.

Ss were more heterogeneous in their reaction to people than to curricula. Ratings by each age and handicap group suggest a need for psychological reexamination of current curriculum structure. (23 ref.)—*Author abstract*.

Gifted

8931. Ripin, Margaret. **Teaching: Round table.** *Journal of Emotional Education*, 1969(Win), Vol. 9(1), 33-39.—Presents a round-table discussion with 4 of the teachers in Gramercy Hill Institute on the differences between the traditional teaching and a new form of creative teaching. The Institute for Emotional Education community includes a junior/senior high school whose educational philosophy is based on the belief that a child's emotional needs are as important as his intellectual and physical needs. The school deals largely with gifted children who have "turned off and tuned out" of the traditional educational system and who challenge the educational world to give them a reason to "tune in" again.—*Journal summary*.

Remedial Education

8932. Glavach, Mathew & Stoner, Donovan. (Gladstone High School, Azusa, Calif.) **Teaching the unteachables.** *California Journal of Educational Research*, 1970(May), Vol. 21(3), 111-119.—24 9th grade, difficult-to-reach children who tested 2 or more yr. below expected grade level, participated in a 1 semester 3-hr daily core program. The program utilized problem-solving and self-direction. 1 page assignments in perception, memory, reading, math, and social sciences pegged to individual student interests were the starting points. Skinnerian principles of small steps easily accomplished with prompt feedback were found most effective. A realistic system of daily rewards was used. At the end of the experimental period, 11 out of 24 Ss returned to regular classrooms.—H. J. McWhinnie.

Sensory & Physical Handicaps

8933. Johnson, Philip R. **Physical education for blind children in public elementary schools.** *New Outlook for the Blind*, 1969(Nov), Vol. 63(9), 264-271.—Suggests and describes a plan for implementation of integration of blind children into physical education classes with sighted children. The kinesthetic approach is of primary necessity in teaching physical education to the blind, and the instructor must demonstrate each new physical skill while blind students actually feel the parts of the body involved in performing that skill. The teaching of games of low organization, relays, apparatus play, and swimming is discussed in detail. (30 ref.)—P. R. Shibelski.

8934. Korsunskaya, B. D. **Metodika obucheniya glukhikh doshkol'nikov rechi.** [Methods for teaching speech to deaf preschool children.] Moscow, USSR: Prosveshchenie, 1969. 296 p.—Describes and recommends methods which are supported by theoretical considerations, developed by the author, and the results of pedagogical experiments conducted by her.—I. D. London.

8935. Kulagin, Yu. A. **Vospriyatie sredstv naglyadnosti uhashchimisa shkoly slepykh.** [Perception of learning aids by pupils in the school for the blind.] Moscow, USSR: Pedagogika, 1969. 296 p.

—Presents the results of studies on the perception of learning aids by blind children under experimental conditions and those prevailing in the classroom of the special school for the blind.—*I. D. London.*

Mental Retardation & Learning Disorder

8936. **Christoplos, Florence.** (Choppin State Coll., Baltimore, Md.) **Programming for children with learning disabilities.** *Journal of Learning Disabilities*, 1969(Jan), Vol. 2(1), 43-48.—Describes and defines programing and its particular importance for teachers of children with learning difficulties. By instituting a defined set of goals and standards, teaching can proceed by a subtle gradient to proficiency. Goals are stated clearly before the program is begun, and progress evaluated. Teaching becomes individualized and contributes a much needed increase in the efficient use of time and personnel. It is concluded that the use of programing in the schools eventually may eliminate the current dichotomy between regular and special education.—*Journal abstract.*

8937. **Crawford, Lee.** (Edgemoor School, Houston, Tex.) **Perceptual-motor development and learning.** Houston, Tex: Edgemoor, 1968. v, 18 p.

8938. **Dykman, Roscoe A., et al.** (U. Arkansas, Medical Center, Little Rock) **Children with learning disabilities: Conditioning, differentiation, and the effect of distraction.** *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 766-782.—Found that in Luria-type conditioning procedures, 82 8-11 yr. old male children with learning disabilities (CLD) erred more than 34 academically adequate controls and took longer to react. Hyperactive CLD had quicker reactions than hypoactive CLD. The finding that CLD average .1 sec. longer to process information than controls helps explain their rapid loss of attention in the classroom. (25 ref.)—*Journal abstract.*

8939. **Gallagher, James L.** (U.S. Office of Education, Bureau of Education for the Handicapped, Washington, D.C.) **Educational research and its impact on mental retardation.** *Mental Retardation*, 1969(Apr), Vol. 7(2), 38-40.—Examines the requirements of research designs and models in educational research, emphasizing the inclusion of the "complex social context in which most of the child's learning takes place." Research, development, demonstration, implementation, and adoption are viewed as the stages through which knowledge is translated into action in the improvement of educational programs for the mentally retarded.—*G. Steele.*

8940. **Hearns, Rudolph S.** (550 N. West Ave., Vineland, N.J.) **Dyslexia and handwriting.** *Journal of Learning Disabilities*, 1969(Jan), Vol. 2(1), 37-42.—Discusses the use of graphology as a diagnostic tool in determining the presence of dyslexia. It is concluded that the possibility that certain deviations from the norm may indicate the presence of dyslexia. (17 ref.)

8941. **Humes, Charles W.** (Westfield Public Schools, Pupil Personnel Services, Mass.) **A novel group approach to school counseling of educable retardates.** *Training School Bulletin*, 1970(Nov), Vol. 67(3), 164-171.—Describes innovative group counseling procedures and counseled group response with educable mentally retarded adolescents in a public school setting. In the project 2 different groups received 12 1 hr. counseling sessions with a different counselor for each group. The 1st 3 sessions were facilitative (unstructured) and the

remaining meetings were problem-oriented (structured). The problem-oriented phase used selected pictures from the TAT Symonds Picture-Story Test as pictorial stimuli. Analysis of counseled group response suggest that the technique can be used successfully with this population. (15 ref.)—*Journal abstract.*

8942. **Pinskiĭ, B. I.** **Psikhologiya trudovoi deyatel'nosti uchashchikhsya vspomogatel'noi shkoly.** [Psychology of the work activity of pupils in the auxiliary school.] Moscow, USSR: Prosveshchenie, 1969. 152 p.—Presents the results of observational and experimental studies dealing with the psychology and pedagogy of work activity by pupils in schools for the mentally retarded.—*I. D. London.*

8943. **Stock, Claudette.** (U. Colorado, Medical Center, Denver) **The "not quite" child.** *Journal of Learning Disabilities*, 1969(Jan), Vol. 2(1), 49-50.

8944. **Taylor, George R.** (Coppin State Coll.) **Programming for educable mentally retarded children.** *Training School Bulletin*, 1970(Nov), Vol. 67(3), 183-188.—Outlines an approach to improve programing for educable mentally retarded (EMR) children which incorporates several goals formulated by the Education Policies Commission for all children. Guidelines to enable EMRs to reach their optimum growth are presented. These include: (a) early identification of the mentally retarded; (b) assignment of the child to special classes according to his needs and suitable for his CA; (c) a practical curriculum based on needs, interests, and capacities that will promote personal and social growth; (d) facilities, equipment, and supplies that will foster such a curriculum; (e) specially trained teachers; and (f) a well defined guidance program.—*Journal abstract.*

8945. **Wagner, Rudolph F.** (Richmond Public Schools, Va.) **Form symbolization in normal readers and dyslexics on a modified pattern recognition theory.** *International Journal of Symbolology*, 1970(Apr), Vol. 1(3), 51-56.—Form symbolization as measured by the Kahn Test of Symbolic Arrangement seems to be unique and set apart from other visual behavior. Form symbolization should be distinguished from pattern symbolization, the former being the lower level in a hierarchical structure. It should be possible to enhance perception by perceptual training and experience.—*P. Lichtenstein.*

Emotional Disorder

8946. **Marrone, R. Thomas & Anderson, Nancy.** (Montgomery County Schools, Norristown, Pa.) **Innovative public school programing for emotionally disturbed children.** *American Journal of Orthopsychiatry*, 1970(Jul), Vol. 40(4), 694-701.—Describes a co-operative effort between a county division of special education and various school districts within that county in establishing, within the schools themselves, an educational and group therapy treatment program in special classes for emotionally disturbed children.—*Journal abstract.*

COUNSELING & GUIDANCE

8947. **Altmann, Harold A.** (U. Calgary, Alberta, Canada) **Factors in the initial interview related to counseling continuation and termination.** *Alberta Journal of Educational Research*, 1970(Sep), Vol. 16(3), 131-135.—Investigated 19 initial counseling interviews in an attempt to identify factors possibly related to

counseling continuation or termination. Clients' concerns were identified prior to counseling and raters judged the extent to which these concerns were discussed in the initial interview. The raters also judged how well counselors developed client problems during the interview. Significant differences were observed between the expectations clients had prior to counseling and what actually occurred during the initial interview in 4 of the 8 unsuccessful cases; in 8 of the 11 successful counseling cases the expected content correlated highly with the actual content.—*Journal abstract.*

8948. Conklin, R. C. & Zingle, H. W. (U. Calgary, Alberta, Canada) **Counselor sensitivity and cognitive style.** *Western Psychologist*, 1969(Sep), Vol. 1(1), 19-28.—Hypothesized that counselors with an "analytic" cognitive style will score higher on tests which measure interpersonal sensitivity. Ss were 63 counselors from public and separate schools. Measures included the Hidden Figures Test and 4 tests administered after the viewing of the Cline Interpersonal Perception Films. Analytic counselors were defined as those scoring above the mean on the Hidden Figures Test. Results support the hypothesis and suggest that "counselors possess both the ability to attend to the vocal and visual cues as well as the ability to postdict behavior from a minimal amount of information." (27 ref.)—P. McMillan.

8949. Kaplan, Fredlee. **Education therapy.** *Journal of Emotional Education*, 1969(Spr), Vol. 9(2), 63-68.—Discusses how the denial of self-expression and educational opportunities by parents or teachers may lead to a pattern of failure, a self-image of incompetence, and a search for the approval of others. A therapeutic approach is illustrated which allows a student-client to develop self-respect and to assume responsibilities without fearing loss of love through failure. Search for approval is redirected toward constructive goals by establishing an atmosphere of concern and understanding in which the motivation to succeed can replace the search for approval.—S. Appelle.

8950. Kearney, Jacqueline E. **Vocational guidance at the University of Papua and New Guinea.** *Australian Psychologist*, 1969(Jul), Vol. 4(1), 37-47.—Attempted to improve the preuniversity guidance of students, as well as their selection and guidance within the university. 105 Ss were interviewed on the 1st day after arrival as to vocational aspiration, and during their last 18 mo. as to vocational choice, using the Rothwell Interest Blank. Analysis of chi square results show that just over 50% of the 93 occupations chosen were inappropriate for the university presently offering training, indicating a need for better vocational training, better, less directive, more permissive guidance, enabling people to express their true feelings about careers and giving them the information necessary to make a logical choice. Ways in which the school counselor, guidance officer, and teacher can best help the student during his early vocational choice years, avoiding any imposition of their own authority or judgment are suggested.—T. N. Webster.

8951. Milan, Mikuláš & Dicső, Viliam. **Monografia Dunajevského skúšky.** [A monograph on Dunajevský's test.] *Psychologica: Sborník Filozofickej Fakulty, U. Komenského, Bratislava*, 1967, Vol. 18(7), 111-135.—In a study of the use of Dunajevský's test (NR) in educational guidance in the technical field, 4 problems are discussed: (a) comparison of results of high-school graduates and technical university students specializing in mechanical and electrical engineering, (b) internal factor analysis of

technical students' NR tasks, (c) scoring the tasks in the tests, and (d) comparison of results of studies of the technical students with the NR scores obtained. (Russian & German summaries)—*English summary.*

8952. O'Shea, Arthur J. & Harrington, Thomas F. (Boston State Coll., Mass.) **Using the Strong Vocational Interest Blank and the Kuder Occupational Interest Survey, Form DD, with the same clients.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 44-50.—Discusses potential problems for counselors which were revealed in a study of the relationships between the SVIB and the Kuder Occupational Interest Survey, Form DD. Ss were 175 undergraduates administered both tests. Frequent inconsistencies and contradictions were found; like-named scales appeared to be measuring different things, while dissimilar scales often had strong positive relationships. 1st results of a long-term follow-up study are described and further emphasize the differences between the inventories. Implications of findings for counselors are discussed.—*Journal abstract.*

8953. Owen, Isaiah. (West Virginia State Coll.) **Adlerian counseling in racially mixed groups of elementary school children.** *Individual Psychologist*, 1970(Nov), Vol. 7(2), 53-58.—Reports the lack of experimental support for the hypothesis that Adlerian counseling would significantly modify negative intergroup attitudes in racially mixed groups and for the hypothesis that the changes would be greater in Ss counseled simultaneously by both a Negro and a white person. 5th and 6th graders, approximately evenly divided between both races, and most residing in the same lower socioeconomic neighborhood, were randomly assigned to an experimental group led by either a white, a Negro, or a white and a Negro counselor or to a similarly led control group which engaged in light conversation, magazine reading, or playing records or games.—A. R. Howard.

8954. Park, James & Eberlein, Larry. (U. Alberta, Edmonton, Canada) **Self-ideal congruence and flexibility in counselling.** *Western Psychologist*, 1969(Sep), Vol. 1(1), 39-45.—Examined the relationship between self-ideal (S-I) congruence and supervisor ratings of counselor trainee performance on a cognitive flexibility scale to determine if such a relationship might be linear or curvilinear. Ss were 69 counselor trainees in a university counseling practicum. The Leary Interpersonal Check List was used for self- and ideal-self concept scores, and the Counsellor Rating Scale for supervisor ratings. Results failed to support a linear relationship. However, 8 of the 11 subscales were significantly related to S-I values under a curvilinear analysis. These findings suggest the presence of an optimal range of S-I congruence, i.e., those trainees with moderate S-I discrepancies generally received higher supervisor ratings. (23 ref.)—P. McMillan.

8955. Redding, Rodney. (Thomas Coll.) **Self-referred students and other-referred students using college counseling services.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 22-25.—Determined the extent to which counseling services should actively engage administration and faculty participation in referring students for counseling. 51 self-referred undergraduates were compared with a sample of 51 other-referred Ss on the basis of graduation from the university and improvement or decline of GPAs. Results indicate that counseling is more effective with self-referred Ss than with other-

referred Ss. Ways in which college counseling services may implement their goals are discussed.—*Journal abstract.*

8956. Shappell, Dean L., Hall, Lacy G., & Tarrier, Randolph B. (Wayne State U., Coll. of Education) **Perceptions of the world of work: Inner-city versus suburbia.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 55-59.—Investigated the relationship of sex and socioeconomic status to the perceptions of the world of work for 186 9th graders drawn from 2 different schools which represented divergent socioeconomic settings. A relatively new measure for assessing personal-occupational values was used. Findings indicate that Ss' perceptions were differentiated by socioeconomic status, but not so much by sex. Implications of results as they might apply to the planning of guidance programs are offered.—*Journal abstract.*

8957. Troth, William A., Hall, Gwendolyn L., & Seals, James M. (East Texas State U., Counseling Center) **Counselor-counselee interaction.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 77-80.—Used an interaction scale consisting of 12 counselor and 10 counselee subroles to analyze 50 interviews recorded in a public school setting. Subroles were divided into direct and indirect categories for the counselor and defense and growth categories for the counselee. All interviews were rated for rapport, ranked, and placed into high-, middle-, and low-rapport groups. Subsequently, the various groups and subrole combinations were tested for significance. Results indicate that the interaction scale was useful in providing a basis for studying counselor-counselee interaction within the counseling interview.—*Journal abstract.*

8958. Weiss, David J. (U. Minnesota) **Research methodology: Further considerations in applications of factor analysis.** *Journal of Counseling*, 1971(Jan), Vol. 18(1), 85-92.—Reviews problems of communality estimation, number of factors, rotation, and computation of factor scores with implications for counseling psychology research. Issues in communality estimation include use of reliabilities, highest correlation, and squared multiple correlations. Methods of deciding on the number of factors include the H. F. Kaiser criterion, scree test, parallel analyses, etc. Reasons for rotation of factor matrices are discussed, and suggestions are made concerning oblique vs. orthogonal, quartimax vs. varimax, and other rotational decisions. Use of 3 types of factor scoring procedures is discussed. Suggestions also are made concerning data essential to meaningful reporting of a factor analysis. (23 ref.)—*Journal abstract.*

8959. Wilcove, Gerry & Sharp, W. Harry. (U. Wyoming) **Differential perceptions of a college counseling center.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 60-63.—Sampled parents of students, student services personnel, faculty, counselors, and the general student body to gain an understanding of the perceived role of a college counseling center. The Counseling Appropriateness Checklist was used to measure the extent to which Ss believed that 3 problem areas, college routine, vocational choice, and adjustment to self and others, were appropriate for discussion with a counselor. Significant differences were found between the various groups. Counselors differed most from other groups on the adjustment to self and others problems areas. Differences on this problem area were also found between certain student subgroups.—*Journal abstract.*

8960. Young, Richard O. (Oregon State U.) **A study**

of sophomores who used career counseling services. *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 457.—5 predictive measures were used to compare 70 sophomores who visited the college placement office seeking career counseling information, with their entire sophomore class at the university. The males and females in the former group were found to have equal, if not superior academic, intellectual, and personal abilities on nearly every measure as compared with their classmates.—R. H. Mueller.

PERSONNEL

8961. Dahl, Ernest W. (American River Coll.) **Role perceptions and job satisfaction among lower and middle level junior college administrators.** *California Journal of Educational Research*, 1970(Mar), Vol. 21(2), 57-63.—Interviewed 24 administrators from 6 school districts in 8 junior colleges. The Ss included 12 lower and 12 middle level administrators. Job satisfaction was found to be high, 80% saw their roles as providing for innovative-type leadership. Most felt they had no adequate preparation for their roles, and few spent any time with students. Ss had a large amount of personal involvement in their jobs, and many were bothered by rules against their teaching. (15 ref.)—H. J. McWhinnie.

8962. Rand, Leonard P. & Carew, Donald K. (Ohio U.) **Comparison of T-group didactic approaches to training undergraduate resident assistants.** *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 432-438.—Compared 3 procedures involving 90 undergraduates to determine which would develop the most competent students for a resident assistantship position in a dormitory. Besides a control group which received no training, 1 group was involved in a didactic lecture and group discussion class, while the other group was involved in a basic encounter course. The criteria used to evaluate the methods included the residence students' evaluation of their resident assistant, the supervisor's evaluation of the resident assistant, and the resident assistant's self-evaluation. The resident assistants who had participated in the encounter group were perceived by the students to be significantly better than either of the other groups. The study suggests that if the goals of a resident assistant include working effectively and helpfully with undergraduate students, a basic encounter experience may well be a useful tool in the training program.—R. H. Mueller.

8963. Walberg, Herbert J. (Harvard U.) **Professional role discontinuities in educational careers.** *Review of Educational Research*, 1970(Jun), Vol. 40(3), 409-420.—In this review an attempt is made to reevaluate some research on role transition among educators, specifically college presidents and teachers in the lower schools. This review is considered from a number of viewpoints. The several divisions of the discussion are: the collegium and bureaucracy, the consequences of bureaucracy, Getzel's model, career transitions, teacher roles, and roles of college presidents. Weber's theory of bureaucracy was found to be a "useful construct for examining research on educational role transition." (2 p. ref.)—P. D. Leedy.

Teachers & Teacher Training

8964. Garvey, Reba. (Cleveland State U.) **Self-concept and success in student teaching.** *Journal of Teacher Education*, 1970(Fal), Vol. 21(3), 357-361.—The

problems of predicting success in teaching have not yet succumbed, even to the lifelong efforts of devoted researchers. It may be of some value to study existing relationships between self-reported measures of self-concept and success in student teaching. For appraisal of self-concept, a standardized and multidimensional instrument was selected—The Tennessee Self Concept Scale was administered to 150 student teachers. Those seniors rated high in student teaching did report higher self-concepts, especially in relation to identity (what I am); evidenced less confusion, uncertainty, and conflict in self-perception, particularly in scores on net conflict and total variability scales; and demonstrated less similarity to patient or disturbed groups and more to the well-integrated group. The converse appears to be true. These findings may merely confirm what teacher educators and supervisors have long suspected—that success in student teaching is affected, but not necessarily determined, by a positive view of oneself, lack of confusion in self-perception, and good adjustment. But supplementing intuition with quantitative information prior to the student-teaching experience may assist those responsible for the preparation of teachers in helping their students learn effectively to “use themselves” as professional workers.—*F. O. Triggs.*

8965. Hofer, Manfred. (U. Düsseldorf, Inst. of Psychology, W. Germany) *Zur Impliziten Persönlichkeitstheorie von Lehrern.* [On the implicit personality theory of teachers.] *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1970, Vol. 2(3), 197-209.—The implicit personality theory of 2 groups of primary school teachers (Ns = 40 and 66, respectively) was obtained by 2 methods: multidimensional scaling of the similarity between 25 personality attributes, and by factor analysis of ratings of pupil types on the same attribute and their opposites. The 2 methods resulted in much the same factor structure, characterized by 5 bipolar dimensions: scholarly disposition, lability, intelligence, dominance, and sociability. It is concluded that personality structures of pupils insofar as they are based on ratings of their teachers reflect mainly the expectations of the 2nd group. (English summary) (27 ref.)—*R. F. Wagner.*

8966. Lee, Walter S. (Tamalpais Union High School District, Calif.) *Human relations training for teachers: The effectiveness of sensitivity training.* *California Journal of Educational Research*, 1970(Jan), Vol. 21(1), 28-34.—51 elementary school teachers in 3 Los Angeles County elementary school districts volunteered to participate in a study designed to investigate and evaluate the effectiveness of sensitivity training as a part of inservice teacher training program in human relations. Ss were randomly assigned to 1 of 3 conditions: sensitivity training (n=20), classroom lecture (n=10), or control (n=21). The sensitivity training and the classroom discussion groups received a total of 20 hr. of instruction in human relations. The Minnesota Teacher Attitude Test (MTAT) and a Q-Sort Test of Self-Esteem were used to assess the effects of instruction. Sensitivity training group Ss scored significantly higher on the MTAT and on the variables of self-esteem and self-value than did the other 2 groups. Results are discussed in terms of future research in this area of teacher training.—*H. J. McWhinnie.*

8967. McClain, Edwin W. (U. Tennessee) *Personal growth for teachers in training through self-study.* *Journal of Teacher Education*, 1970(Fal), Vol. 21(3),

372-377.—Describes a course designed to facilitate self-actualization through increased self-understanding. In order to insure personal involvement and (it is hoped) personal growth, the major focus has been on the individual student's written analysis of massive personality test data about himself. Nearly all class time was devoted to the administration of the personality instruments and a discussion of the meanings of the results. The following assessment devices were used for the self-studies: Jourard's Self Disclosure Questionnaire, Cattell's 16 PF, the EPPS, Schutz' Fundamental Interpersonal Relations Orientation-Behavior Questionnaire, Rokeach's Dogmatism Scale, a questionnaire from Maslow on peak experiences, and stories written for 8 TAT pictures. The 3 measures of self-actualization used as pre- and posttests were Shostrom's Personal Orientation Inventory, McKinney's Sentence Completion Blank, and an adaptation of Bill's Index of Adjustment and Values. It has been demonstrated that self-study can help produce more accurate self-concepts. The phenomenologists have developed the idea that people's ways of perceiving determine their behavior. If the experiences of the course have made for more realistic self-perceptions, it follows that student behavior should become more effective. There were unsolicited reports from the students themselves that the experiences in the course resulted in personal enhancement.—*F. O. Triggs.*

8968. Obrenović-Sindelić, Milijana. *Zavisnost ocenjivanja pismenih zadataka od pola i nekih crta ličnosti nastavnika.* [Dependence of ratings given to pupils' essays in Serbo-Croat language on the sex and certain personality traits of teachers.] *Psihologija*, 1969(Sep), Vol. 2(2), 458-466.—Examined whether personality traits influence the rating process and attempted to determine which of the following personality traits have a significant influence on the ratings given to pupils' essays in Serbo-Croatian language: rigidity, hostility, anxiety, and dependence. The relationship between sex and personality traits and ratings observed on the dimension rigor-leniency was studied in 40 raters who taught 7th grade pupils in Serbo-Croatian. 10 essays of different quality were used. Personality traits were determined through a questionnaire. It is concluded that: (a) Ss differ significantly in the rating of essays confirming the notion that the subjectivity of teachers represents an important factor in the rating of essays; and (b) the ratings do not depend on the sex of S, but are influenced by certain personality traits.—*English summary.*

8969. Pratzner, Frank C. & Hanson, Marjory. *The relative effectiveness of two ways of structuring and presenting pre-service and initial in-service vocational-industrial teacher education lessons.* Minneapolis, Minn.: Minnesota Research Coordination Unit in Occupational Education, U. Minnesota, 1969. 16 p.

8970. Schwebel, Andrew I. (Yale U.) *Physical and social distancing in teacher-pupil relationships.* *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1551.

8971. Shapiro, Barbara. *Training the emotional educator.* *Journal of Emotional Education*, 1969(Win), Vol. 9(1), 28-32.—Describes a new teacher-training program at the Gramercy Hill Institute which attempts to develop teachers who will be able to remain totally flexible within a minimally structured environment.

8972. Wink, Richard L. (Ohio State U., Mansfield) *The relationship of self-concept and selected per-*

sonality variables to achievement in music student teaching. *Journal of Research in Music Education*, 1970(Fal), Vol. 18(3), 234-241.—A study of 40 music student teachers showed: (a) "a positive significant relationship between self-concept of music teaching ability and achievement in student teaching." (b) Significant changes occurred during the student teaching experience for the Bills Index of Adjustment and Values (IAV) and Wink's Self-Concept of Music Teaching Ability (SCMTA), but not for the EPPS or the Institute of Personality and Ability Testing Anxiety Level. (c) "Changes occurring during the student teaching experience for the IAV, SCMTA, and EPPS were not significantly related to achievement; but those who achieved higher in music/student teaching indicated significantly less anxiety than those who achieved lower." (d) "Music teachers with a high self-concept were dependent, conforming, and gregarious." (e) The better adjusted Ss showed significantly less anxiety. (f) "Ss in the experimental group were significantly higher than the normal population in self-concept, deference, and order; they were significantly lower in affiliation, intraception, and anxiety." (g) "High achievers in music student teaching indicated a high need for deference, order, and affiliation; they indicated a low need for autonomy. There was no difference between high and low achievers for anxiety level."—D. Higbee.

SCHOOL LEARNING & ACHIEVEMENT

8973. Alschuler, Alfred S. (Harvard U.) **The effects of classroom structure on achievement motivation and academic performance.** *Educational Technology*, 1969(Aug), Vol. 9(8), 19-24.—Describes a motivational research investigation into the effects of restructuring the classroom from a power orientation—teacher making rules and decisions and students competing with each other—to an achievement orientation—students planning their own learning strategies to obtain standards of excellence measured against objective external criteria. In a 10th grade business education typing class, the restructured class after 3 quarters averaged 54% more net words/min than the control class. In a 5th grade mathematics class, the restructured class earned 2.85 yr. on the Stanford Achievement Test of Mathematics as compared to .36 yr. for the control class. It is concluded that "these 2 small studies suggest that restructuring classroom learning for achievement motivation can dramatically increase the amount students learn."—S. Knapp.

8974. Bibace, Roger & Hancock, Karen. (Clark U.) **Relationships between perceptual and conceptual cognitive processes.** *Journal of Learning Disabilities*, 1969(Jan), Vol. 2(1), 17-29.—Tests the current assumption that mastery of perceptual-motor processes is necessary prior to acquisition of higher cognitive processes and, hence, to scholastic achievement. 8 boys aged 7-8 and 12-13 were given the Kephart Perceptual-Motor Survey and 3 learning tasks in an experimental design allowing for variation in perceptual-motor functioning and scholastic ability. Some Ss performed well in school despite perceptual-motor deficiencies. Only in terms of high vs. low scholastic achievement did the differences between the groups reach significance. It is concluded that the "theoretical assumption must at least be qualified and that the clinical-pedagogical practices based on this assumption need to be reexamined." 6 critiques follow.—*Journal abstract*.

8975. Choppin, Bruce H. **The relationship between achievement and age.** *Educational Research*, 1969(Nov), Vol. 12(1), 22-29.—Examines data from an international study of school achievement in which the mathematics achievement of stratified samples of several thousand 13-14 yr. old children from each of 12 countries was assessed. Analysis of data from Japan, England, France, Sweden, and the United States provided little evidence to support the contention that children born at any particular time of the year are superior; in general, older children were found to perform better. The effect of being younger or older than the class average did "not seem to be of first importance." Implications for grade-promoting and grade-repeating were discussed, and a proposal for introducing greater flexibility into the promotion system was suggested.—R. Wilz.

8976. Frost, Barry P. (U. Calgary, Alberta, Canada) **Extraversion and educational achievement.** *Western Psychologist*, 1969(Sep), Vol. 1(1), 5-18.—Reviews the literature concerning the relation between extroversion and educational achievement and discusses the reasons for some of the contradictory results. An additional study is also reported relating extroversion to cognitive measures. Ss were 310 11-yr-old London school children who were administered various personality inventories, tests of intellectual and academic ability, and measures of social class and parental interest. Results obtained are discussed in light of the previous contradictory findings. Based on the S. B. Eysenck and H. J. Eysenck (see PA, Vol. 38:916) conception, it is suggested that (a) extroversion is an aspect of assertiveness, or (b) that both assertiveness and submission are aspects of extroversion. Perference is indicated for the 1st alternative. (44 ref.)—P. McMillan.

8977. Grgin, Tomislav. **Kako ocjenjivaci-muškarci i ocjenjivaci-žene procjenjuju znanje učenika razlicitoga spola.** [How do male raters and female raters evaluate the knowledge of pupils of different sex.] *Psihologija*, 1969(Sep), Vol. 2(2), 445-457.—Statistical analysis of ratings given by male and female raters to pupils of different sex in the initial grades of elementary school shows that their statistical distributions of ratings differ. However, in the use of particular categories of ratings, with the exception of the rating excellent, statistically significant differences were not found. When male and female raters evaluated the scholastic achievement of male and female pupils separately, there were no significant differences between the ratings given to male and female pupils. In the final grades, the evaluation of scholastic achievement of male pupils, made by female raters, differed significantly from the ratings given to female pupils by female raters. Differences found in the evaluation of scholastic achievement of male and female pupils, made by male raters, were not statistically significant. Evaluation of scholastic achievement of male pupils given by female raters differed significantly from the evaluation of scholastic achievement of male pupils given by male raters. In the evaluation of scholastic achievement of female pupils, statistically significant differences were not found between male and female raters.—*English summary*.

8978. Henderson, Edmund H. & Long, Barbara H. (U. Delaware) **Correlations of reading readiness among children of varying background.** *Reading Teacher*, 1968(Oct), Vol. 22(1), 40-44.—States that important factors for reading readiness are age, classroom behavior, and preschool educational experience, and that

teacher judgment based upon observation of classroom behavior is a sound predictor of reading readiness. The present study reaffirms this relationship and suggests the usefulness of this relatively simple and reliable method for the assessment of social maturity in the 1st wk. of Grade 1.—*P. D. Leedy.*

8979. Jeffares-Fast, Dolores J. & Cosens, Grace V. (Red Deer Public School Board, Alberta, Canada) **Effect of socio-economic status and auditory discrimination training on first-grade reading achievement and auditory discrimination.** *Alberta Journal of Educational Research*, 1970(Sep), Vol. 16(3), 165-178. Reports the relationship found in 2 studies between auditory discrimination and reading achievement of 1st graders. Auditory discrimination was measured with an instrument constructed by the researchers. The Jeffares-Fast study found a significant relationship between auditory discrimination and both reading achievement and socioeconomic status. The pattern of discrimination errors was the same for all children in the sample but the other than low socioeconomic group achieved consistently higher scores than the low socioeconomic group. The Cosens study revealed that taped training in auditory discrimination resulted in improved scores on total auditory discrimination and several sound types, but not on oral or silent reading. Some types of sounds were significantly more difficult to discriminate than other types.—*Journal abstract.*

8980. Johnson, Joseph C. (Duke U.) **Relationships between attitudes reflected in thematic content and recalled comprehension.** *Reading Teacher*, 1968(Dec), Vol. 22(3), 276-277.—Examined the reader in Grades 4-6 with regard to the manner in which his attitude toward certain thematic content is related to his comprehension of the reading selections. It is concluded that significant differences in total recalled comprehension could not be traced to differences in attitude.—*P. D. Leedy.*

8981. Johnson, Ronald J. (U. Minnesota) **The effect of training in letter names on success in beginning reading for children of differing abilities.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1520.

8982. Koppitz, Elizabeth M. (Board of Cooperative Educational Services, Yorktown Heights, N.Y.) **Emotional indicators on human figure drawings and school achievement of first and second graders.** *Skolepsykologi*, 1968, Vol. 5(6), 369-372.—Compared the human figure drawings (HFDs) of 100 good and 61 poor 1st and 2nd grade students for the presence of 30 emotional indicators. "Chi-squares were computed for the number of HFDs with and without each individual" emotional indicator. The following emotional indicators "were found to be significantly related to school achievement in the primary grades: Poor integration of parts, slanting figure, omission of body and arms, and 3 or more figures spontaneously drawn. It appears, therefore, that these items can be used as indicators of potential learning problems when screening school children with the HFD Test."—*P. Shibleski.*

8983. Lurçat, Liliane. **Les rapports du mot et de la phrase dans la dictée du débutant.** [Relationships of word and phrase in beginning dictation.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(1-3), 86-91.—Administered a dictation test to pupils of a preparatory class, a 1st-yr primary class, and a remedial class, which enabled the analysis of certain disorders of graphico-phonetic connections at the moment of their establishment. At the level of the word they are characterized by schematiza-

tion, of which 3 stages can be distinguished: letter, syllable, and word. At the level of the phrase they are characterized by arbitrary linkages and breaks within the word. These disorders disappear during the 1st-yr primary class but persist and are systematized in the remedial class.—*English summary.*

8984. McClelland, David C. (Harvard U.) **The role of educational technology in developing achievement motivation.** *Educational Technology*, 1969(Oct), Vol. 9(10), 7-16.—Reviews research and findings on motivation and achievement. Current studies are described as examining the various functions which educational technology can perform in developing motivation, e.g., conveying information better, arousing attention, arousing and sustaining achievement motivation, stimulating fantasy, encouraging participation, making self-study easier, and making available methods for developing achievement on a large scale. The techniques developed and the difficulties encountered in each of these areas are briefly outlined.—*S. Knapp.*

8985. Misner, Marilyn S. & Wellner, William C. (U. Illinois, Office of Student Programs & Services) **Factors associated with scholastic productivity in high and low achieving sororities.** *Journal of College Student Personnel*, 1970(Nov), Vol. 11(6), 445-448.—Studied the influence of the degree of selectivity, the house's overall scholastic program, and the attitudes toward scholarship as possible factors differentiating high- and low-achieving sororities. 306 Greeks from 2 high- and 2 low-achieving sororities were compared. It was found that high-achieving sororities tend to select pledges with a better academic record than do low-achieving sororities. Both groups seem to provide similar scholastic facilities. The major difference between the groups is their attitude toward scholarship. Whereas high-achieving sororities emphasize it over social aspects of campus life, their counterparts in the low-achieving groups tend to stress these to opposite degrees.—*R. H. Mueller.*

8986. Popović, Tomislav. **Pohvala i pokuda kao motivi u školskom radu ekstravertne i introvertne dece.** [Praise and blame as motives in the school work of extrovert and introvert children.] *Psihologija*, 1969(Sep), Vol. 2(2), 467-474.—Investigated the influence of praise and blame on extrovert and introvert pupils. The pupils were divided into 4 experimental groups and a control group. Each group consisted of 40 pupils identified as extrovert or introvert by means of Eysenck's Junior MPI. Over a 6-day period, Ss were praised and blamed in accordance with the fictional division into groups, irrespective of results actually achieved. Their task each day consisted of subtraction of 4-digit numbers. By a statistical analysis, significant differences were found to exist between the results of each group achieved on the 1st and on the 6th day, and also between the praised and blamed groups of introverts and extroverts, respectively. Ss in the extrovert blamed and introvert praised groups achieved better results each subsequent day, while the extrovert praised and introvert blamed groups achieved worse results in comparison with the 1st day. Results became worse in the control group also. Significant differences were not found to exist between boys and girls within each of these groups although the girls tended to achieve better results in the praised groups and the control group, while the boys achieved better results in the blamed groups.—*English summary.*

8987. Roueche, John E. & Hurlburt, Allan S. (U. California, Los Angeles) **The open-door college: The problem of the low achiever.** *Journal of Higher*

Education, 1968(Nov), Vol. 39(8), 453-456.—An increasing proportion of full-time students in community colleges are low achievers, identified by standardized test scores and high school grades, who enter the community college for a variety of reasons and are now its major problem. Courses and curricular programs developed in a trial-and-error fashion for the low achievers are usually remedial. While the open-door (or "revolving door" concept, as referred to cynically by critics because of alarming attrition rates) has validity only if these students are able to succeed in their educational objectives, evidence shows that by far the majority of these students fail to complete remedial courses satisfactorily, are doomed to failure, or forced to terminate their education.—*T. N. Webster*.

8988. Saruk, Alec & Gulutsan, Metro. (Lamont High School, Alberta, Canada) **Academic performance of students and the cultural orientation of their parents.** *Alberta Journal of Educational Research*, 1970(Sep), Vol. 16(3), 189-195.—587 students of Ukrainian descent in northeastern Alberta, Canada, were divided into 4 groups according to the cultural orientation of the parents: bicultural, English, Ukrainian, and apathetic. The groups were compared as to their performance on the Grade 9 Alberta Examinations, on a standardized reading test (the Sequential Test of Educational Progress), and on School and College Ability Test (SCAT). Academic performance was expected to be higher or similar to the provincial average among students of the bicultural and English-oriented parents because school work of these students was likely to be similar to the culture at home, and hence, reinforced. No significant differences were found. Thus, school performance was not associated with differences between the cultural orientations of the home and of the school.—*Journal abstract*.

8989. Slaughter, Diana T. (Yale U., Child Study Center) **Parental potency and the achievements of inner-city black children.** *American Journal of Orthopsychiatry*, 1970(Apr), Vol. 40(3), 433-440.—Administered an Educational Attitude Survey to 72 working class mothers of innercity black kindergartners. The variable, futility, i.e., sense of powerlessness regarding the educational system, was not found to be significantly correlated with children's achievements. Data suggest mothers' preparatory teaching behaviors are more predictive. Implications for parental involvement in schools are discussed. (19 ref.)—*Journal abstract*.

8990. Sockloff, Alan L. (Emory U.) **The analysis of student characteristics associated with grades for varying levels of college freshman grade complexity.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 903-904.

8991. Solan, Harold A. (Fairleigh Dickinson U.) **Visual processing training with the tachistoscope: A rationale and grade one norms.** *Journal of Learning Disabilities*, 1969(Jan), Vol. 2(1), 30-36.—Establishes a set of expected tachistoscopic responses for 1st grade children and calculates the coefficient of correlations between success in reading and the responses.

8992. Zandstra, J. **Schoolweerbarmheid: Amsterdamse kritiek op een Utrechtse studie.** [School success: An Amsterdam critique about an Utrecht investigation.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Jul), Vol. 25(7), 469-473.—This critique of J. C. Rupp's book [*Nurture Toward School Success*] takes exception to the viewpoint of Rupp

who seeks to differentiate between the effects of the cultural-pedagogical levels of the child's family and the emotional climate of that family. The argument by Rupp is further weakened by the absence of factor analysis or analysis of variance in seeking support for the above assertion.—*A. J. Ter Keurst*.

Prediction

8993. Amelang, Manfred & Vagt, Gerhard. (U. Hamburg, Inst. of Psychology, W. Germany) **Warum sind die Schulnoten von Mädchen durch Leistungstests besser vorherzusagen als diejenigen von Jungen?** [Why are the grades of girls based on performance tests easier to predict than those of boys?] *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1970, Vol. 2(3), 210-220.—Following up observations by H. G. Seashore (see PA, Vol. 38:3194), the correlations between ability tests and grades were recorded for both sexes. Ss were 112 15-yr-old students. The differences found for English and German (as school subjects) were essentially explained by the fact that girls are more integrated in the school system than boys. Good integration was defined as good conduct, conforming behavior, and high interest in socializing and education as well as literature and language. (English summary)—*R. F. Wagner*.

8994. Ernest, David J. (St. Cloud State Coll.) **The prediction of academic success of college music majors.** *Journal of Research in Music Education*, 1970(Fal), Vol. 18(3), 273-276.—Analysis of scores from the American College Tests (ACT), Minnesota Scholastic Aptitude Test (MSAT), Triggs Reading Survey, High School Rank (HSR), Cumulative College Honor Point Ratio (HPR), and Honor Point in Music Courses (MHP) for the 27 women and 41 men graduating from a state college with a major in music between December 1960 and August 1967 indicates that the best single predictor for HPR and MHP was HSR. A combination of HSR, Triggs, and MSAT produced the best multiple correlation coefficient figure ($R = .574$) as a predictor of HPR or degree of academic success. Combining HSR with Triggs as a predictor of MHP gave only a slightly better result ($R = .449$) than using HSR alone. All these correlation coefficients were significant at the .01 level.—*D. Higbee*.

8995. Scott, Ralph. (U. Northern Iowa, Educational Clinic) **Perceptual readiness as a predictor of success in reading.** *Reading Teacher*, 1968(Oct), Vol. 22(1), 36-39.—Reports the results of a follow-up evaluation of children's kindergarten scores on an experimental Seriation Test and their second grade reading attainment. The experimental findings indicate that there is a meaningful relationship between young children's perceptual skills and their later success in reading.—*P. D. Leedy*.

Overachievement & Underachievement

8996. Brown, Roy I. (U. Calgary, Alberta, Canada) **Problems of learning with exceptional children.** *Western Psychologist*, 1969(Sep), Vol. 1(1), 29-38.—Discusses problems of attention in the field of learning with

children who, for a variety of reasons, are underachieving. Results of 3 illustrative studies are presented. Exp. I, a visual task, tested the effect of increasing visual stimulation in a group of adolescents with a mean Wechsler IQ of 65. Exp. II, an auditory task, involved alternation of high and low levels of auditory extraneous stimulation, using Ss similar to those in Exp. I. Exp. III applied similar tasks to a group of 4-12 yr. old mentally retarded children under 2 conditions: (a) in their own classrooms where the noise level was high, and (b) in a separate quiet room where noise and visual stimulation were at a minimum. Overall results suggest that, for both older and younger Ss, unfamiliarity and newness of task or environment constituted major factors of attention problems. Suggestions for teachers of such children are included. (23 ref.)—*P. McMillan*.

8997. Kipnis, David & Resnick, Jerome H. (Temple U.) **Experimental prevention of underachievement among intelligent impulsive college students.** Philadelphia, Pa.: Temple U., 1969. 16 p.

CURRICULUM & PROGRAMS

8998. Artëmov, V. A. **Psikhologiya obucheniya inostrannym yazykam.** [Psychology of teaching foreign languages.] Moscow, USSR: Prosveshchenie, 1969. 280 p.—Presents an analysis of the experimental results of a number of psychological and phonetic investigations in the teaching of foreign languages.—*I. D. London*.

8999. Brison, David W. (Ed.) (Ontario Inst. for Studies in Education, Toronto, Canada) **Accelerated learning and fostering creativity.** Toronto, Canada: Ontario Inst. for Studies in Education, 1968. v. 22 p.

9000. Elson, Alex & Elson, Miriam. (11 S. LaSalle St., Chicago, Ill.) **Educating teachers and children in law: An approach to reduced alienation in inner-city schools.** *American Journal of Orthopsychiatry*, 1970(Oct), Vol. 40(5), 870-878.—Describes an experimental program conducted in Chicago inner-city schools that gives promise that teaching law concepts can lessen the sense of alienation in children who know law mainly as a repressive force. Children are introduced to law by the inquiry method, which seems to have therapeutic elements that fulfill emotional and educational needs.—*Journal abstract*.

9001. Grossman, Marvin. (U. South Florida) **Art education for the young child.** *Review of Educational Research*, 1970(Jun), Vol. 40(3), 421-427.—There are strong indications that a developmental art program, stressing cognitive and sensory exploration can increase kindergarten children's abilities to include more visual information in their drawings. The directions pointed out in this paper indicate the importance of continued research in art education to determine the full implications and potential of developmental instruction in art for children. (2 p. ref.)—*P. D. Leedy*.

9002. Hallam, Roy. (St. Martin's Coll., Lancaster, England) **Piaget and the teaching of history.** *Educational Research*, 1969(Nov), Vol. 12(1), 3-12.—Suggests that previous research indicates most students up to the age of 16 yr. old are still at what Piaget terms the concrete operational level of thought, and proposes a number of techniques to facilitate the learning of history in such students. It is suggested that (a) history in the early years of secondary school "should not be over-abstract in form, nor should it contain too many variables"; (b) the materials should "match" the stu-

dents' thinking skills; (c) emphasis should be placed on the "concrete" aspects of history; (d) teachers should encourage reversibility in student thinking by presenting contrasting views on particular topics; (e) carefully organized written work, dealing with 2 or more viewpoints, should be assigned; (f) methods by which the past can be made vivid and concrete, e.g., visual aids, should be emphasized; and (g) subtlety in moral judgments can be encouraged by considering the motives behind a person's actions. Examples are given to illustrate the various techniques. (37 ref.)—*R. Wiltz*.

9003. Newburger, Doris. (Manhattan Community Coll., City U. New York) **Role training in speech classes at a metropolitan community college under open admissions.** *Group Psychotherapy & Psychodrama*, 1970, Vol. 23(1-2), 27-29.—Reports results of an attempt to improve the abilities of community college students by using role-playing techniques as an inherent part of a speech class. While the results did not lead to the conclusion of definite positive effects, there is evidence that with a longer period of training such success would come.—*A. Krichev*.

9004. Nikonova, S. M. **U istokov sovetskoi metodiki obucheniya inostrannym yazykam.** [At the sources of Soviet methods of foreign language teaching.] Moscow, USSR: Vysshaya Shkola, 1969.—Discusses the history of foreign language teaching in Russia from 1900-1917 and in the Soviet Union from 1917-1923.—*I. D. London*.

9005. Rankin, Earl F. & Thames, Charlotte L. (U. Kentucky) **A methodology for studying children's reactions to stories in first grade readers.** *Reading Teacher*, 1968(Dec), Vol. 22(3), 242-245, 299.—Ss were a 1st grade class of 20 students in a Texas elementary school. 1st graders can make meaningful discriminations indicating interests in 1st grade reading material. Female Ss gave higher ratings to both stories than the males, but only the females showed a significant difference in ratings for the 2 stories used.—*P. D. Leedy*.

9006. Williams, Robert L. (U. Tennessee) **What are we learning from current programs for disadvantaged students?** *Journal of Higher Education*, 1969(Apr), Vol. 40(4), 274-285.—Outlines characteristics of disadvantaged or "high risk" students and lists types of academic programs and assistance provided for them by colleges, including financing, compensatory study, individualized and programed instruction, etc. The primary objective of such programs is the creation of those conditions necessary for academic success, conditions lacking in the backgrounds of most disadvantaged students. Universities' initial results in attaining this goal have been favorable; in most instances the mortality rate for disadvantaged students has been no higher than for regular students. Factors responsible for the success or failure of disadvantaged students are discussed. The fundamental components of all high risk programs are: financial assistance, housing with regular students, and initial orientation. Crucial academic questions include whether high risk students should be placed in specially designed or regular courses. To succeed high risk programs must provide intensive personal counseling, and must have the support of students and top level administrators.—*T. N. Webster*.

Teaching Methods & Teaching Aids

9007. Andersen, Dan W. (U. Wisconsin) **Teaching**

handwriting. Washington, D.C.: National Education Assn., 1968. 31 p.

9008. **Avanzini, Guy.** (U. Lyons, Experimental Pedagogy Lab., France) **A propos d'un projet d'école expérimentale: Quelques remarques sur les conditions de validation des techniques Freinet.** [A propos of an experimental school project: Remarks on the conditions of validation of the Freinet technique.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(1-3), 81-85.—Proposes the organization of, and outlines the purpose of, a suburban experimental elementary school divided into 2 equal and homogeneous sections. Experimental classes would be taught by the Freinet free-expression method and control classes taught by the traditional method. The project, a joint effort of the Institute of Psychology, Sociology, and Pedagogy and the Experimental Pedagogy Laboratory of the University of Lyons, and the Rhône Departmental Group of the Modern School, already agreed to by local authorities and now awaiting central authorization, anticipates lengthy administrative problems in starting and continuing, will require great perseverance of teachers, will be difficult to evaluate by inadequate current tests, and will suffer the irreducible handicap of exclusively metric treatment. Experimental pedagogy is confronted here by an original problem, much more delicate than those posed by the limited comparison of didactic methods, and should be approached by more complex procedures than those currently available.—*T. N. Webster.*

9009. **Ball, G. A., et al.** (Inst. of Psychology, Kiev, USSR) **Issledovanie obuchayushchikh programm s razlichnym razmerom shaga.** [Study of teaching programs with different step-sizes.] *Programmirovannoe Obuchenie*, 1969, No. 4-5, 83-93.—3 variants (with respect to step-size) of a ramified teaching program were administered to matched groups of 9th grade students. It is shown that, with increase in step-size, learning time diminishes, but quality of learning suffers. However, significant influence of step-size on quality of learning is demonstrated only for poor pupils.—*I. D. London.*

9010. **Bosco, Frederick J. & Di Pietro, Robert J.** (Georgetown U., School of Languages & Linguistics) **Instructional strategies: Their psychological and linguistic bases.** *IRAL: International Review of Applied Linguistics*, 1970(Feb), Vol. 8(1), 1-19.—Discusses (a) 3 major foreign-language teaching strategies, (b) the psychological and linguistic bases of these strategies, and (c) the direction of emerging strategies of instruction. The 3 current strategies include the grammar-translation method, the direct method, and the audiolingual approach. Emerging strategies are predicted to include an overcoming of molecularity, a deemphasis of the peripheral reference of behavior, a convergence of the nomothetic and idiographic viewpoints, and emergence of a cyclic approach in ordering learning tasks. (French & German abstracts)—*P. McMillan.*

9011. **Crawford, Alan N.** (California State Coll., Los Angeles) **A pilot study of computer-assisted drill and practice in seventh grade remedial mathematics.** *California Journal of Educational Research*, 1970(Sep), Vol. 21(4), 170-181.—36 7th grade underachieving and disadvantaged students were assigned to 2 sections taught by the same teacher, the experimental group received the daily computer-assisted instruction whereas the control group received only the regular classroom instruction. Each S spent up to 15 min. daily on the computer for a 8-wk period. The arithmetic section of

the Wide Range Achievement Test was used as a pre- and posttest. No significant differences were found. There was however a marked increase in Ss' interest and attitudes towards mathematics in the experimental group. The value of this study laid in the identification of specific problems for future research. The Wide Range Achievement Test was judged not to be the best assessment instrument.—*H. J. McWhinnie.*

9012. **Davydov, V. V. (Ed.)** **Psikhologicheskie vozmozhnosti mladshikh shkol'nikov v usvoenii matematiki.** [Psychological capacities of young schoolchildren in mastering mathematics.] Moscow, USSR: Prosveshchenie, 1969. 288 p.—Presents a collection of 6 articles, reporting the results of research undertaken to provide psychological foundation for the content and methods utilized in the new course of mathematics for the "3-yr elementary school."—*I. D. London.*

9013. **Demia, A. A. & Chub, A. T.** (Instrument Construction Inst., Sevastopol, USSR) **Kontrollruyushchaya mashina s kompleksami zavisimyykh voprosov.** [Testing machine with complexes of dependent questions.] *Programmirovannoe Obuchenie*, 1969, No. 4-5, 180-189.—Utilizing mathematical logic, it is shown that the development of question cards by means of complexes of interdependent questions has a number of advantages over their linear construction. Described are the advantages, apparatus, and working principle of a testing machine, which permits the input of complexes of dependent questions.—*I. D. London.*

9014. **Dwyer, Francis M.** (Pennsylvania State U., Instructional Research) **Effect of visual stimuli in complementing televised instruction.** *California Journal of Educational Research*, 1970(Jan), Vol. 21(1), 43-47.—Attempted to measure the effectiveness of varied visual illustrations containing different amounts of realistic detail of the human heart in TV instruction and to determine which type of illustration was most effective in terms of cognitive understanding about the human heart. 157 Ss in a speech course were divided into 5 groups: (a) received a lecture on the human heart, (b) viewed line drawings with lecture, (c) viewed shaded drawings with lecture, (d) viewed a model with lecture, and (e) viewed realistic photographs with lecture. 5 criterion measures assessed the effects of the treatments. Results indicate that the use of visuals was not an effective way to facilitate this specific kind of learning. The use of the visuals was only successful on the drawing test. It is concluded that the single line drawing should be used to complement oral instruction.—*H. J. McWhinnie.*

9015. **Dykstra, Robert.** (U. Minnesota) **The effectiveness of code- and meaning-emphasis beginning reading programs.** *Reading Teacher*, 1968(Oct), Vol. 22(1), 17-23.—Draws together specific data from the Cooperative Research Program by G. L. Bond and R. Dykstra (see PA, Vol. 42:4557) pertinent to the issue of the relative effectiveness of code-emphasis programs in initial reading instruction. Although the study supports, in general, J. Chall's conclusions "concerning the superiority of code-emphasis programs in beginning reading," a note of caution is in order. There is no clear evidence that the early emphasis on code, per se, is the only or even the primary reason for the relative effectiveness of the code-emphasis approach.—*P. D. Leedy.*

9016. **Gebos, A. I.** (Inst. of Psychology, Kiev, USSR) **Aktivizatsiya poznavatel'noi deyatel'nosti**

uchashchikhaya v usloviyakh programmirovannogo obucheniya. [Activation of the cognitive activity of pupils under programmed teaching.] *Programmirovannoe Obuchenie*, 1969, No. 4-5, 73-82.—Reports results of a study of the "effectiveness of a linear teaching program with constructed answers" as a function of means of activation of thinking activity: (a) by means of questions, requiring the insertion of omitted words; and (b) by means of multiple-choice questions, requiring the analysis of possible answers. The 2nd is shown to enhance the effectiveness of teaching programs.—I. D. London.

9017. Harmin, Merrill; Kirschenbaum, Howard, & Simon, Sidney B. (Southern Illinois U.) **Teaching science with a focus on values.** *Science Teacher*, 1970(Jan), Vol. 37(1), 16-20.—Examines a method of teaching values in science which presents subject matter on 3 levels: factual, conceptual, and value. Requisites of this method are involvement of the student and suspension of reward and punishment systems during value discussions. Suggestions of topics which lend themselves to this method and projects associated with them are presented.—G. Steele.

9018. Jones, Edward R. **Simulation applied to education.** *Washington University Department of Psychology Technical Report*, 1968, No. 15, 30-43.—Examined present and projected capabilities in aerospace simulation to determine what aspects might be adapted for classroom use. The attributes of simulators and the criteria that must be met before they can be adopted were considered. It is concluded that because simulators are expensive to acquire and operate, their justification must be unique. It appears that beyond a few conventional uses, they could best be applied to the integration of complex skills and knowledge. This process would be relatively economical if existing computer models from research and development programs are adapted to classroom use.—*Journal summary*.

(Pedagogical Inst., Nezhsinsk, USSR) **Avtomatizirovannyi klass AK-N2.** [Automated apparatus in the AK-N2 class.] *Programmirovannoe Obuchenie*, 1969, No. 4-5, 197-202.—Describes the construction of the system and the character of its utilization in the educational process. It is simple in construction; yet has rather wide capabilities for testing the learning of study materials and for directing the independent work of pupils.—I. D. London.

9024. McDowell, Paul & McWhinnie, Harold J. (Brookhaven High School, Columbus, O.) **Drawing-by-seeing: The use of Sherman's flash method with secondary school art students.** *Acta Psychologica, Amsterdam*, 1970(Aug), Vol. 32(4), 399-404.—Compared "the effects of using the flashed rectilinear shapes as warm-up exercises versus the use of other parts and exercises of the Sherman method, but not the daily warm-up slides" with high school students in beginning art classes. Results indicate that "the flashroom warm-up treatment produced a negative effect" and that there was "a significant interaction effect between judges and sex."—G. Steele.

9025. McLeish, John. (U. Alberta, Edmonton, Canada) **Students' attitudes to teaching methods.** *Alberta Journal of Educational Research*, 1970(Sep), Vol. 16(3), 179-187.—College of Education students in England's Cambridge Institute of Education area were studied by the application of questionnaires at the beginning and end of their courses. Their attitudes to teaching methods (lecture, tutorial, and seminar) were very similar to all other groups of students investigated—highly unfavorable to the lecture method, strongly in favor of tutorial and seminar. These differences that appear between students are related to their political but not their religious views. There are also differences connected with their subject specialism and age. A student typology based on attitudes to teaching methods is found to stand up to analysis in a College of Education as well as a university setting.—*Journal abstract*.

(Eds.) **Matematicheskie mashiny i programmirovannoe obuchenie.** [Mathematical machines and programmed instruction.] Minsk, USSR: Belorussian State U., 1969. 208 p.—Presents a collection of 27 articles, 10 of which report the results of research on the use of teaching machines in the pedagogical process.—*I. D. London.*

9032. Regan, James J. **Computer assisted instruction (CAI): Some facts and fancies.** *Washington University Department of Psychology Technical Report*, 1968, No. 15, 15-29.—Describes the status of computer assisted instruction (CAI), including "CAI centers, languages, programs, support, and economics." Problems concerning educational costs, enrichment of the learning process, student-computer relationships, programming of material, author-student languages, and instructional strategy are examined. Research on CAI effectiveness is reviewed and evaluative problems are discussed. A discussion by R. Gagné follows.—*G. Steele.*

9033. Rothkopf, Ernst Z. & Bloom, Richard D. (Bell Telephone Lab., Murray Hill, N.J.) **Effects of interpersonal interaction on the instructional value of adjunct questions in learning from written material.** *Journal of Educational Psychology*, 1970(Dec), Vol. 61(6, Pt. 1), 417-422.—Investigates whether delivery of adjunct questions by teachers promotes more effective study of written material than written adjunct questions embedded in text. 63 high school students studied a 16,000 word earth science text presented on 108 slides. Treatments were: written question, 1 written question every 6th slide; oral question, 1 question asked by a teacher orally every 6th slide; and a control group without adjunct questions. The oral question group scored significantly higher on a criterion test ($X = 56.0\%$) than the written question group ($X = 48.8\%$). Both groups scored significantly higher than the control ($X = 42.8\%$). Results indicate that social interaction can aid in shaping and maintaining effective study activities. (17 ref.)—*Journal abstract.*

9034. Shankman, Florence V. (Temple U.) **Games reinforce reading skills.** *Reading Teacher*, 1968(Dec), Vol. 22(3), 262-264.—Games can be used to reinforce reading skills. Directions for playing the games should be clear and they should be capable of being played with a minimum of supervision. Games should have a real learning value that reinforces or teaches a reading skill. Games involving word recognition should not be used until pupils have met the words in a meaningful situation. A wide range of games can help in individual need satisfaction. If interesting and challenging, games can contribute a great deal to the development of specific skills.—*P. D. Leedy.*

9035. Shapiro, Barbara. (Gramercy Hill Inst., New York, N.Y.) **Awakening the desire to learn.** *Journal of Emotional Education*, 1969(Spring), Vol. 9(2), 57-62.—Describes personal experiences with the use of voluntary participation in school group projects as a means of increasing motivation for self-learning.

9036. Webb, Clark & Baird, J. Hugh. (Brigham Young U.) **Learning differences resulting from teacher- and student-centered teaching methods.** *Journal of Higher Education*, 1968(Nov), Vol. 39(8), 456-460.—Attempting to modify the traditional pattern of teacher-centered learning (in which the student attends a fixed number of professor-directed classes regularly throughout a 10- or 16-wk period), and to increase the learner's responsibility for his learning, a form of student-centered teaching has been employed at Brigham Young University since 1959. Called Continuous Progress (CP), it includes: (a) a 1-to-many teacher-student relationship, (b) standard catalog courses, (c) few or no formal meetings, (d) individual conferences with the instructor, and (e) student progress at an individually determined rate. To determine learning differences between students completing a teacher education course on a CP basis and on a conventional lecture-discussion basis, an 75-item objective exam intended to measure course content knowledge was administered as a pre- and posttest 16 wk. later. Posttest scores were compared using the *t* ratio for unmatched samples; the CP-taught group performed significantly better than the control group. Results suggest that the low GPA group performed better as a result of receiving CP instruction than did their counterparts who completed the course under conventional instruction methods, and raise more questions about assumptions of how college students learn.—*T. N. Webster.*

PERSONNEL & INDUSTRIAL PSYCHOLOGY

9037. Burke, Ronald J. (York U., Toronto, Ontario, Canada) **Methods of resolving interpersonal conflict.** *Personnel Administration*, 1969(Jul), Vol. 32(4), 48-55.—Attempts to replicate a study by R. J. Burke using a different methodology and "to specify more precisely the characteristics of the Confrontation or Problem Solving method of conflict resolution." 57 managers provided 53 descriptions of effective and ineffective conflict resolution. These examples were classified into 1 of the following categories: (a) withdrawing, (b) smoothing, (c) compromising, (d) forcing, and (e) confrontation or problem-solving. Results indicate problem solving to be the most effective and forcing to be the least effective method. Effective and ineffective examples are provided. It is concluded that results are consistent with those of R. J. Burke.—*G. Steele.*

9038. Delahanty, David. (Manhattan Coll., School of Business) **Three aspects of nonverbal communication in the interview.** *Personnel Journal*, 1970(Sep), Vol. 49(9), 757-759.—Considers the 3 relevant aspects of nonverbal communication (gestures, space, and time) as reinforcements of spoken words in an interview that a personnel administrator might conduct.—*P. L. Crawford.*

9039. Fortuna, Angelo L. (Ed.) **Personnel research and systems advancement: Proceedings 25th Anniversary Symposium.** *USAF PRL Technical Report*,

1967(Dec), No. 67-13, 182 p.—Presents papers from the Symposium on Personnel Research and Systems Advancement. Topics include reviews of activities underway in the field of personnel research and projections into future activities of researchers, planners, and managers in both academic and operational settings. The papers reflect a wide range of experience and interests of speakers representing the military services, governmental agencies, and private industry.—*Journal abstract*.

9040. Gardner, David M. & Rowland, Kendrith M. (U. Illinois) **A self-tailored approach to incentives.** *Personnel Journal*, 1970(Nov), Vol. 49(11), 907-912, 917.—Primarily, deals with incentives for salesmen; however, concepts such as motivation and attitudes, are included. The approach is psychological rather than economical.—*P. L. Crawford*.

9041. Harrell, Thomas W. (Stanford U., Graduate School of Business) **The personality of high earning MBA's in small business.** *Personnel Psychology*, 1970(Fal), Vol. 23(3), 369-375.—In order to assess the personality of high earning Masters of Business Administration in small businesses, a battery of 11 tests was administered to 7 graduating classes. Results indicate 9 of a possible 55 predictors were significantly different for high and low earning masters. Of the 9 variables, ascendance showed the greatest difference.—*D. Dieterly*.

9042. Mann, Philip A. (U. Texas) **Police responses to a course in psychology.** *Crime & Delinquency*, 1970(Oct), Vol. 16(4), 403-408.—A psychology course was offered to policemen in order to improve their understanding of human behavior. Results indicate increased effectiveness of participating policemen as well as enhanced interest in a broader education.—*M. P. Edwards*.

9043. Pyron, H. Charles & Manion, U. Vincent. (U. Oregon, Coll. of Business Administration) **The company, the individual, and the decision to retire.** *Industrial Gerontology*, 1970(Win), No. 4, 1-11.—This preliminary survey on a long-range research program on phenomena of retirement preparation programs presents company policies, for retirement between ages 48-62. Questionnaire responses from a 201 nationwide sample are analyzed. 73 companies participated in a survey of 2053 of their early retirees (excluding disability retirees). 52% responded, of whom $\frac{2}{3}$ were salaried, and $\frac{2}{3}$ were hourly employees. The survey purpose was to ascertain current income and health status, to elicit information on attitude toward leisure, reasons for early retirement, and significance of preretirement preparation. 15% retired because they were too ill to work; 30% rated health as poor or fair at time of retirement; 23% felt that retirement was not entirely voluntary; $\frac{2}{3}$ reported that their families encouraged them to retire; 28% thought co-workers encouraged their retirement; 15% viewed their retirement as encouraged by their company, 20% as discouraged, and 62% neutral; 3% made no response. 84% favored company help in planning for retirement. Retirees, in general, had a favorable attitude toward their companies. Few early retirees had returned to work. 80% felt that they had adequate income and that their plans for retirement had worked out satisfactorily.—*A. Cawley*.

9044. Schrieber, David E. & Sloan, Stanley. (U. Wisconsin, Management Inst.) **Incentives: Are they relevant? obsolete? misunderstood?** *Personnel Administration*, 1970(Jan), Vol. 33(1), 52-57.—Reviews the economic and psychological perspectives of incentives. An alternative approach which suggests a combination

of these incentive systems to minimize factors contributing to previous failures and to provide psychological rewards is explored.

VOCATIONAL CHOICE & GUIDANCE

9045. Bartlett, Willis E. & Tageson, Carroll W. (U. Notre Dame) **Crisis in religious careers: The frustrations of a vocational psychologist.** *National Catholic Guidance Conference Journal*, 1970(Fal), Vol. 15(1), 63-70.—Based on the assumption that the choice of a career in religion is just as developmental a process as an interest and commitment to other careers, the Lewin Psychological Success Model is proposed as a framework for research. A further assumption that the vocational psychologist has much to contribute to the study and understanding of religious careers from a developmental context, is used to explain his frustration when experienced religious simply do not accept the assumption. A 3rd assumption is that vocational maturity does exist and is highly correlated with general personality maturity. Conclusions include suggestions for the establishment of career development agencies for clergymen and religious already committed to religious careers; and a continuing interdenominational center for the study of religious careers.—*A. M. Cawley*.

9046. Fernández, Gustavo; Lara Tapia, Luis, & Hereford, Carl F. **Replica de factores en el inventario de Intereses Profesionales de Hereford.** [Factor replication in the Hereford Professional Interest Inventory.] *Revista Interamericana de Psicología*, 1970(Mar), Vol. 4(1), 51-57.—Measured the reliability of all the factors identified in the Hereford inventory. Ss tested were 250 male and female, 17-24 yr. old students from a preparatory school in Toluca, Mexico. Retesting of the inventory used 211 of the initial 250 Ss. Factor analysis of the data indicate that calculus, mechanics, musical art, and plastic arts were reliable; and the areas of biology, physics, social service, literature, executive persuasion, and verbal were not reliable. Data indicate that 4 areas of the inventory can be considered valid while the remaining 6 areas are not to be considered valid until further evaluation has been completed. (English & Portuguese summaries)—*H. Lohn*.

9047. Johansson, Charles B. (U. Minnesota) **Psychometric characteristics of the inventory of Interests.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1519.

9048. Miller, Kenneth M. (National Foundation for Educational Research in England & Wales, Slough, England) **Manual for the Rothwell-Miller Interest Blank.** Slough, England: National Foundation for Educational Research in England & Wales, 1968. vii, 108 p.

9049. Schlegel, Justin. **L'emploi du test de Rorschach en psychologie industrielle.** [Use of the Rorschach test in industrial psychology.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(1-3), 29-43.—Reviews the literature, examining uses of the Rorschach Test in vocational selection, guidance, and rehabilitation. It is concluded that the Rorschach (a) though not an intelligence test and not to be used as 1, may be used to complement the latter; (b) is not at present a reliable tool for evaluating creative aptitudes; (c) should be used for examination of lower echelon workers only in difficult cases involving maladjustment, accident proneness, or rehabilitation; (d) is useful in all cases requiring

personality testing, valuable for what it adds to other tools; (e) is most useful in selection of applicants, revealing personality traits pertinent to predicting future achievement or failure in the position applied for; (f) supplemented by Piotrowski's Perceptanalytic Executive scale, has advanced beyond the empirical phase in selecting management personnel; (g) will increase in value due to the new approach of W. H. Holtzman, J. S. Thorpe, J. D. Swartz, and E. W. Herron, applying "strict methodology, pertinent remarks, and ingenious solutions for a precise notation of responses," and (h) in spite of failures, should be retained as a valuable tool in industrial psychology. (103 ref.)—*T. N. Webster.*

SELECTION & PLACEMENT

9050. Abrahams, Norman M., Neumann, Idell, & Githens, William H. **An assessment of faking on the Strong Vocational Interest Blank under actual selection conditions.** *USN Personnel & Training Research Laboratory Technical Bulletin*, 1970(Mar), No. 70-6, 8 p.—Contrasted the responses of several groups of Ss administered the SVIB under a variety of conditions. SVIBs taken by 102 Navy Reserve Officer Training Corps (NROTC) applicants as part of a routine non-Navy testing program were obtained and compared with those taken under actual NROTC selection conditions ($N=102$). Results were compared with those obtained from a previously conducted simulated faking study. Previous data indicated that when instructed to fake, most Ss could increase their scores on the selection scale to some extent. However, comparison of applicant and routine administrations indicates that under actual selection conditions there is neither a significant nor a consistent tendency for applicants to increase their selection scores. Results suggest that: (a) simulated faking designs do not parallel what occurs in selection, instead, they provide only an indication of how much a scale can be faked; and (b) faking is not a serious problem in the use of the SVIB in NROTC selection.—*Journal abstract.*

9051. Bale, Ronald M. & Waldeisen, Lewis E. **The relationship of the Objectively Scoreable Apperception Test (OAT) to success in naval aviation training.** *USN AMI Army-Navy Joint Report*, 1969(Jun), No. 1076, 6 p.—Administered the Objectively Scoreable Apperception Test (OAT) to 725 naval aviation officer candidates (AOCs) during their 1st wk. of training to examine the potential of the OAT as a supplement to the primary selection system. Multiple correlations were 1st determined by using only the scores from existing primary selection variables; the criterion was completion vs. separation from flight training. With a 2nd set of multiple correlations the dimension scores of the OAT combined with those of the primary selection variables were used. Results reveal that inclusion of the OAT scores significantly augmented the multiple correlation; however, under cross-validation the inclusion of those scores did not result in a significant increase in predictive validity. It is concluded that developing a similar device geared specifically toward a naval aviation population is feasible.—*Journal abstract.*

9052. Dann, Joyce E. & Abrahams, Norman M. **Validation of a biographical information blank as a predictor of retention among mechanical and electrical-electronics enlisted personnel.** *USN Personnel Research Activity Research Memorandum*, 1969(Jun), No.

SRM 69-21, 12 p.—Investigated a Biographical Information Blank (BIB) developed to tap past experience in academic, sports, mechanical, and clerical areas as a predictor of retention. Using samples of men in mechanical and electrical electronics ratings, the BIB was studied as a possible selection and classification instrument for increasing the retention rate of enlisted personnel. Responses of reenlistees and nonreenlistees in each group of ratings were contrasted, and scales were constructed from items differentiating most effectively between the groups. Validities and cross-validities of these scales and of the individual items constituting them were obtained. Scales empirically constructed from the BIB items yielded low validity against a reenlistment criterion for men in both mechanical and electrical-electronics ratings. However, 1 item, a career intention question, did show substantial ability to discriminate reenlistees from nonreenlistees in both samples. It is recommended that stated career intention be considered in making school assignments, especially when a choice must be made among recruits who are otherwise equally qualified.—*Journal abstract.*

9053. Hollmann, Thomas D. (U. Minnesota) **Some factors affecting information processing and decision making in the employment interview.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1579.

9054. Kelleher, Edward J. (Illinois Inst. of Technology) **An empirical comparison of the predictive efficiency of weighting methods.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1579-1580.

9055. Mayfield, Eugene C. **Management selection: Buddy nominations revisited.** *Personnel Psychology*, 1970(Fal), Vol. 23(3), 377-391.—A Buddy Nomination Form of work- and socially-oriented items was developed. The form was used with agents in 3 different life insurance companies. The criteria were a series of performance ratings made by supervisors on the agents. Using a simplified percentage scoring procedure the buddy nominations were found to be significantly correlated to the ratings by supervisors using the chi-square test. A factor analysis indicated that the buddy nomination was largely composed of 1 single general factor.—*D. Dieterly.*

9056. Thomas, Patricia J. **A comparison between the Armed Services Vocational Aptitude Battery and the Navy Basic Test Battery in predicting Navy school performance.** *USN Personnel & Training Research Laboratory Technical Bulletin*, 1970(Jan), No. 70-4, 15 p.—Developed the Armed Services Vocational Aptitude Battery (ASVAB) using items from the services' previously operational tests. The ASVAB was designed as a potential replacement for the Armed Forces Qualification Test and the separate classification batteries used by each of the services. Thus, the effectiveness of the ASVAB in Navy classification needed to be determined and compared with the Basic Test Battery (BTB). The ASVAB was administered to all recruits at 2 naval training centers and the men who subsequently attended a Navy Class "A" school were identified and their BTB scores and school grades obtained. The validities of the ASVAB and BTB tests were investigated within each school and linear-sum correlations were also computed to determine the best combinations of ASVAB tests as possible school selectors. A computerized item selection technique was applied to the tests in each battery. Various item statistics and validities and

reliabilities for the shortened tests were obtained for use in evaluating Form 1 of the ASVAB and in development of subsequent forms. Form 1 of the ASVAB was found to be too easy for effective discrimination among Navy students. Comparisons of the BTB and ASVAB validities uniformly favored the BTB. The linear-sum analysis of possible ASVAB classification composites revealed excessive dependence on the ASVAB Arithmetic Reasoning Test, making selection within a limited talent pool very difficult. It is recommended that: (a) subsequent forms of the ASVAB be made more difficult; (b) ASVAB validities for predicting school performance in the other services be determined; and (c) the effectiveness of the ASVAB for differential classification be improved.—*Journal abstract.*

9057. Tupes, Ernest C. & Miller, Robert E. **Equivalence of AFQT scores for different educational levels.** *USAF AFHRL Technical Report*, 1969(Sep), No. 69-19, 9 p.—Evaluated the magnitude and validity of the effects of formal education on the elevation of Air Force Officer Qualifying Test (AFQT) scores, taking AFROTC and Officer Training School (OTS) applicants as representative of 2 different educational levels at the time of testing. For the pilot composite, separate conversion tables appropriate to the 2 levels were constructed. For all other composites, separate tables were constructed. It was found that the increase in scores between the 2 educational levels is 10-30 percentile points for the various composites, except where initially high scores limit the amount of increase. A 3rd set of conversion tables was constructed intermediate between the AFROTC and OTS tables for use with examinees having intermediate levels of education. 1 consequence of multiple tables is that examinees evaluated on the intermediate or OTS tables will be disqualified for various types of training more frequently than was the case when only 1 set of tables, corresponding to the AFROTC tables, was used. However, the aptitude levels of those who are selected will be higher than heretofore, and it is expected that graduation rates will reflect this difference. The potential increase in graduation rate is estimated at 5% for student pilots commissioned through OTS.—*Journal abstract.*

TRAINING

9058. Chebysheva, V. V. **Psikhologiya trudovogo obucheniya.** [Psychology of vocational training.] Moscow, USSR: Prosveshchenie, 1969. 304 p.—Examines the results of psychological studies on the wide range of problems generally associated with vocational training.—*I. D. London.*

9059. Cory, Charles H. **Biographical differences between navy recruits grouped by mental level, racial identification and career intention.** *USN Personnel & Training Research Laboratory Technical Bulletin*, 1970(Feb), No. 70-2, 37 p.—Provides an interim analysis of a biographical information form developed for predicting effectiveness of Mental Level IV men. An experimental 183-item Navy Biographical Information Form was administered to 6190 incoming navy recruits, and correlation coefficients were computed between each item response and mental level. Although correlations were significant at the .001 level for 163 questions, they were, in general, quite low. Mental level was most highly associated with the content area of academic experiences, attitudes, and aptitudes and had

its lowest correlations with areas involving job tasks or social activities. Negro respondents and those respondents who desired to reenlist in the Navy were found to differ significantly from the total group in the characteristics covered in the questionnaire.—*Journal abstract.*

9060. Fleischman, Howard L. **Consumer acceptance of programmed instruction.** *Washington University Department of Psychology Technical Report*, 1968, No. 15, 60-65.—Assesses consumer's attitudes toward programmed instruction. A questionnaire was developed and administered to Navy and Marine enlisted men (students), and commissioned officers and civilian education specialists (training administrators). Results indicate a favorable response by students and a less favorable to negative response by instructors and training administrators. 9 questions from the questionnaire are presented and discussed.—*G. Steele.*

9061. Johnson, Kirk A. **Evaluation of a partially self-paced course.** *Washington University Department of Psychology Technical Report*, 1968, No. 15, 55-59.—In a course where students learned how to send and receive International Morse Code, the attrition, class days/graduating student, receiving speed after 15 days, and scores on 2 special examinations were compared for 88 students in a regular course, 66 in a course using programmed instruction booklets, and 28 in an individually paced program using programmed instruction booklets. Results indicate a 16% reduction in length of regular course. It is felt that "this course was developed by circumventing rather than solving most of the problems that are associated with individually paced courses."—*G. Steele.*

9062. Mayo, G. Douglas. **The new look in educational technology in technical training.** *Washington University Department of Psychology Technical Report*, 1968, No. 15, 44-46.—Postulates that the trend in educational technology in technical training is "toward individually adapted training, carefully geared to performance requirements." Economic considerations as to the "effective allocation of limited resources" are viewed as the prime influences on the direction of change. Individually adapted training is adaptive in regard to trainee characteristics and the specific terminal performance required. The projected training program would consist of 3 primary instructional tasks: (a) preparation of adaptive material to meet specific behavioral objectives, (b) selection of behavioral objectives pertaining to the position, and (c) the management and monitoring of the training situation.—*G. Steele.*

9063. Mayo, G. Douglas & Longo, Alexander A. **Learning operational equipment as a criterion in training research.** *Washington University Department of Psychology Technical Report*, 1968, No. 15, 47-54.—Compared performance of students receiving training of different lengths with instruction on "the latest maintenance techniques, modifications, operational systems, and circuit analysis of the coder group portion of the IFF/Loran System in the P-3A aircraft." 58 regular Naval personnel graduated from the Aviation Electronics Technician R Course served as Ss. Results indicate that the shorter revised course was at least as effective as the longer course and that "the concept of using performance in a representative equipment course as a measure of the adequacy of previously received basic training" is "feasible from the standpoint of practical application."—*G. Steele.*

TASK & WORK ANALYSIS

9065. **Bergström, Bengt.** (Inst. of Military Psychology, Stockholm, Sweden) **Tracking performance under threat-induced stress.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(2), 109-114.—Studied operator tracking performance in 3 simulated guided missile systems under short-term psychological stress induced by threatening with and also delivering unpleasant electric shocks. 29 male military conscripts served as Ss. The initial part of the stress period was characterized by a moderate decrement of performance and a heightened arousal level, which is regarded as a partial confirmation of the activation theory. Results may also be interpreted in terms of a simple stress-over-time model, based on a hypothetical interaction between arousal and habituation.—*Journal abstract.*

9066. **Gilson, Richard D., Benson, Alan J., & Guedry, Fred E.** **Influence of vestibular stimulation and display luminance on the performance of a compensatory tracking task.** *USN AMI Army-Navy Joint Report*, 1970(Feb), No. 1097, 17 p.—Extends former observations by Melvill Jones on loss of acuity for usual details during unusual maneuvers by investigating the effects of levels of illumination during semicircular canal stimulation on the performance of a compensatory tracking task with an aircraft instrument as the display. It was found that decreasing the luminance of the display over a range from the highest to the lowest levels significantly magnified the degradation of tracking performance resulting from vestibular stimulation, while producing only small changes in nystagmus. Without vestibular stimulation no significant alterations in tracking performance resulted. For a given level of nystagmus, performance of visual tasks may or may not be impaired depending on the level of illumination. It is suggested that the adverse effects of retinal smear resulting from nystagmus-produced image movement across the retina are augmented by decreases in luminance. (17 ref.)—*Journal abstract.*

9067. **Hixson, W. Carroll & Niven, Jorma I.** **Directional differences in visual acuity during vertical nystagmus.** *USN AMI NASA Joint Report*, 1969(Jul), No. 1079, 8 p.—Exposed 20 naval aviator candidates to 4 ramp velocity test profiles generated by the Human Disorientation Device. During 2 of the profiles, Ss were required to observe a visual target consisting of a vertically aligned series of dots and to report the duration of the period where dot fusion or target blur occurred as a result of the vertical nystagmus. It was found that during pitch forward angular acceleration resulting in nystagmus with a slow component upward, the loss of visual acuity was of a significantly longer duration than that present during stimulation in the opposite direction. Directional differences in the vertical nystagmus response were also observed.—*Journal abstract.*

9068. **Mayo, Clyde C.** **A method for determining job types for low aptitude airmen.** *USAF AFHRL Technical Report*, 1969(Nov), No. 69-35, 9 p.—Developed and used an opinion survey method for identifying low aptitude job types in a study of 11 Air Force career ladders. Lists of low aptitude tasks were defined by technical advisers. These tasks were then rated on 9

factors by instructors who also described low aptitude job types and gave their opinion concerning the possibilities for advancement and training of low aptitude personnel. In an evaluation of the research methodology, strengths and weaknesses of the opinion survey method were delineated. The relative ease with which the task lists were constructed support the utility of the method. A limitation in the method was recognized in the inability to control for systematic rater bias.—*Journal abstract.*

9069. **Mayo, Clyde C.** **Construction and administration of ten Air Force job inventories.** *USAF AFHRL Technical Report*, 1969(Oct), No. 69-27, 24 p.—Constructed 10 job inventories to survey 11 Air Force career ladders. Background variables designed to assess task-related information were included in each inventory. A replication of a previous study of contributions of technical advisers to inventory construction supported the earlier finding that airmen at supervisor skill levels provide the best job information. Broad statements of work designed to discriminate between job types on a more global level than task statements were included in 8 job inventories. Trial answer sheets designed to be scored by optical scanning devices were administered on 2 surveys. Inventory constructors predicted job types for all career ladders surveyed. Write-in information from administrative surveys was reviewed, and significant contributions were added to job inventory content. Inventory responses were key-punched and verified in preparation for electronic data processing.—*Journal abstract.*

9070. **Mecham, Robert C. & McCormick, Ernest J.** **The use in job evaluation of job elements and job dimensions based on the Position Analysis Questionnaire.** *Occupational Research Center, Purdue U., Technical Report*, 1969(Jun), No. 3, 24 p.—Tested the hypothesis that job related behavior is importantly and predictably related to going rates of monetary compensation of jobs. Job data were obtained with the Position Analysis Questionnaire (PAQ), a structured job analysis format, for a sample of 340 jobs from 45 organizations. The job sample was randomly divided into 2 subsamples (A and B), and 3 types of possible predictors were derived from the job analysis data obtained with the PAQ. Data were then subjected to a stepwise regression analysis to identify optimum sets of predictors of the wage or salary rates for these jobs. All three types of predictors yielded substantial multiple and cross-validation correlation coefficients with wage and salary rates for the jobs in the samples. It was generally found that predicted compensation rates more closely corresponded to observed rates at the lower end of the compensation scale, than at the upper end. It is suggested that with additional research, this general method might possibly be used as the basis for the development of an operational job evaluation system applicable on an across-the-board basis to jobs of many types.—*Journal abstract.*

9071. **Miller, Earl F. & Graybiel, Ashton.** **Motion sickness produced by head movement as a function of rotational velocity.** *USN AMI NASA Joint Report*, 1970(Mar), No. 1101, 10 p.—To measure the stressor stimulus effect of rotational velocity, 16 young healthy Ss were rotated in a laboratory rotational chair. Standardized 90° head movements were executed at each test velocity until the motion sickness endpoint of moderate or severe malaise was reached. When individual ability

to make head movements without evoking symptoms was exceeded, the derived average stressor effect of each head movement varied directly and, in log-log terms, linearly with rotational velocity. Data provide the basis for grading individual susceptibility to Coriolis sickness with a single numerical score and define the high rate of change of Coriolis stressor effect as a function of rotational velocity.—*Journal abstract.*

9072. Murrell, K. F. (U. Wales, Inst. of Science & Technology, Cardiff) **Quelques considérations sur l'organisation du travail.** [Some considerations in the organization of work.] *Revue de Psychologie et de Sciences de l'Education*, 1970, Vol. 5(3), 268-285.—Discusses the areas covered by ergonomics and 4 topics which are a matter of organization independent of equipment design. A proper understanding of the requirements for work and rest which demand the abandonment of the concept of fatigue is proposed. The relationship between variability and performance on a paced task together with the calculation of the optimum machine speed is described. It is suggested that any difficulty experienced by older workers will be due to technological change rather than to detrimental effects of aging. The problem of shift system is studied stressing the importance of biological and social considerations. (Dutch summary) (34 ref.)—*English summary.*

9073. Podmarkov, V. G. **Sotsial'nye problemy organizatsii truda.** [Social problems in the organization of work.] Moscow, USSR: Mysl', 1969, 216 p.—Presents an interdisciplinary analysis of the social organization of work, including its psychological aspects.—*I. D. London.*

9074. Shepel', V. 9076. Stary, Dinko. **Povezanost vrste posla i poznavanja problematike u radnoj jedinici.** [Connection between the type of work operations and the knowledge of specific problems of a working unit.] *Psihologija*, 1969(Sep), Vol. 2(2), 436-444.—Investigated the connection between the degree of "informedness" on the specific problems of a working unit in a large industrial firm. It is concluded that "informedness" increases with the growing degree of mechanization and automation of work. Given equal availability of information, better use of information in the working organizations in which work operations are performed at a higher level of mechanization or automation, leads to the hypothesis that workers compensate for the monotonousness of the operation they are performing by showing greater interest for the problems of a larger working group.—*English summary.*

9077. Stockwell, Charles W. & Guedry, Fred E. **The effect of semicircular canal stimulation during tilting on the subsequent perception of the visual vertical.**

USN AMI Army-Navy Joint Report, 1969(Nov), No. 1093, 10 p.—Hypothesizes that the perceptual lag results when a man is accelerated on a centrifuge from a conflict between signals arising from the semicircular canals and from the otolith organs. 18 Ss were tilted so that they received consistent semicircular canal and otolith signals. Immediately after being tilted, Ss made estimates of the vertical which were approximately accurate, and continued to make accurate estimates throughout a 140-sec judgment period. The absence of a perceptual lag under these circumstances supports the hypothesis.—*Journal abstract.*

9078. Zhukov, V. G. **Nekotorye voprosy metodiki psikhofiziologicheskikh issledovanii pri razrabotke planov nauchnoi organizatsii uchebno-proizvodstvennogo protsessa.** [Some questions of method in psychophysiological research when developing plans for the scientific organization of the study-and-production process.] *Programmirovannoe Obuchenie*, 1969, No. 4-5, 64-74.—Discusses problems related to estimating the tension of physical and mental work. New criteria for such estimation are suggested. These can be applied to estimate the tension resulting from different study work loads.—*I. D. London.*

PERFORMANCE & JOB SATISFACTION

9079. Berger, Allen J. (New York U.) **The relationship of self-perception and job component perception to overall job satisfaction: A "self-appropriateness" model of job satisfaction.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1578.

9080. Clum, George A. & Mahan, Jack L. (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Attitudes predictive of marine combat effectiveness.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 55-62.—Measured attitudes of 224 marines at the end of recruit training, and of 137 marines after 2 yr. of active duty, using the Marine Corps Opinion Survey as a measure. Ss' attitudes were found to be related to a criterion of rated combat effectiveness obtained approximately 45 mo. after entrance into service. Multiple regression analyses reveal that attitudinal data contributed unique predictive variance when analyzed in relation to the criterion, and that attitudinal data, in combination with biographical data, afforded better prediction than biographical data considered alone. Results suggest the possibility of developing an attitude scale by empirical means which is predictive of long-term service performance.—*Journal summary.*

9081. Coulter, Xenia & Overman, Mary A. **The effect of prior exposure to a harmful event upon subsequent performance under threat.** *USN AMI Army-Navy Joint Report*, 1969(Jun), No. 1077, 12 p.—Investigated effects of (a) the stated probability at .25 vs. .85 with no pretest shock demonstration, and (b) pretest shock demonstration vs. no demonstration with the stated probability held constant at .65. Ss were 70 entering aviation trainees. The task was an S-paced, 4-choice discrimination task. 10 Ss served as controls. A 5-min practice period without threat preceded a 5-min experimental period. It is concluded that: (a) shock demonstration is not necessary, and its elimination would provide a more useful range for individual difference measurement; (b) .65 probability is best for producing measurable performance decrement; and (c)

threat perception as measured by mean performance level across time may be as useful a parameter as performance decrement immediately preceding the anticipated harmful stimulus.—*Journal abstract.*

9082. Dayal, Ishwar. (Indian Inst. of Management, Ahmedabad, India) **Some issues in performance appraisal.** *Personnel Administration*, 1969(Jan), Vol. 32(1), 27-30.—Hypothesizes that "the failure of appraisal programs is due to inept techniques, ineffectual communication between rater and ratee, and the role conflict experienced by the rater," emphasizing the reluctance of managers to "accept the responsibility to judge the performance of other people." It is concluded that "there are 3 sets of issues in developing performance appraisal programs: (a) the system must give knowledge about performance in discrete and recognizable areas of the performer's task, (b) a personal equation between the evaluator and the evaluatee has to be developed to achieve mutual understanding of the criteria of evaluation," and (c) "the inner conflicts and anxieties that accompany the role of a judge in our social system."—G. Steele.

9083. Denova, Charles C. (Hughes Tool Co., Aircraft Div., Culver City, Calif.) **Training evaluation causes change in behavior.** *Personnel Administration*, 1969(Sep), Vol. 32(5), 54-56.—Describes the effects of a training program and follow-up evaluation on job satisfaction and turnover rate. It is concluded that the program was effective in improving employee attitudes and reducing turnover.—G. Steele.

(U.S. Public Health Service, Washington, D.C.) **Work attitudes and retention of engineers.** *Personnel Administration*, 1969(Sep), Vol. 32(5), 57-58.—Describes the results of a survey of work attitudes of 423 Commissioned Officer Engineers in the United States Public Health Service which aimed to identify attitudes associated with staying in or leaving the health organization. The basic attitude dimensions underlying evaluations of various aspects of the employment situation were identified.—*Journal abstract.*

9086. Lyons, Thomas J. (Colorado State U.) **Multiplicative model of job performance.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1580.

9087. Mahan, Jack L. & Clum, George A. (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Longitudinal prediction of marine combat effectiveness.** *Journal of Social Psychology*, 1971(Feb), Vol. 83(1), 45-54.—Studied a sample of 831 marines to define factors related to a battlefield superior officer rating of effectiveness in combat. Factors predictive of combat effectiveness were found for (a) preservice personal background; (b) educational experience; and (c) Marine Corps adjustment and proficiency at recruit training, and 2 yr. of service. Results show that the mature, better educated, more intelligent marine, who has made a good military adjustment (as indicated by his proficiency, obedience, and physical and emotional health), is effective during combat. Utilization of such factors to predict expected combat performance may facilitate military selections, administration, and training procedures.—*Journal summary.*

9088. Martin, Albert R. (Dept. of Health, Education,

& Welfare, Communicable Disease Center, Atlanta, Ga.) **Morale and productivity: A review of the literature.** *Public Personnel Review*, 1969(Jan), Vol. 30(1), 42-45.—Examines the definitions for morale and the dimensions by which it can be measured. A review of the literature leads to the conclusion that "there is no positive correlation between morale, job satisfaction, and productivity."

9089. Peters, Jeanne R. (Duquesne U.) **Constituents of experience in job happiness and unhappiness in employed women.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1580-1581.

9090. Pritchard, Robert D. (U. Minnesota) **An experimental study of the effects of perceptions of equity and inequity on worker performance and satisfaction.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1581.

9091. Quinn, James L. **Bias in performance appraisal.** *Personnel Administration*, 1969(Jan), Vol. 32(1), 40-43.—Examines error in performance appraisal relating to similarity "between the rater and ratee in certain background or nonperformance characteristics." 14 characteristics of 31,518 male Air Force captains, rated by male captains through colonels were investigated to determine bias in performance appraisal. Results indicate (a) there is little positive bias based on similarity, (b) rating scores are related to ratee characteristics, and (c) there is close agreement between superiors sharing common characteristics with the subordinates. It is concluded that "little bias in performance ratings of Air Force captains could be attributed to the relationships investigated by the study."—G. Steele.

9092. Robinson, David D. (Ernst & Ernst, Boise, Ida.) **Predicting police effectiveness from self reports of relative time spent in task performance.** *Personnel Psychology*, 1970(Fal), Vol. 23(3), 327-345.—In an effort to establish a criteria measure for the complex occupation of police officer, this study proposes to gauge the amount of time spent on job tasks as a possible solution. 76 items were selected from a questionnaire and used in the Office of Law Enforcement Assistant Project. The reduced questionnaire was administered to 118 patrolmen. A factor analysis and a multiple regression analysis were performed to predict the 3 criteria measures: supervisor's rating of overall performance, complaints vs. compliments, and peer ratings. The factor analysis yielded a general factor, 2 subgeneral factors and 6 specific factors. The multiple regression analysis provided significant correlations with all 3 criteria. It is concluded that the amount of time spent on data collected by self-reports was highly effective in concurrently predicting job performance. D. Dieterly.

9093. Rosenthal, Edmond M. (American Management Assn., Pontiac, Ill.) **Greener pastures: Why employees change jobs.** *Personnel*, 1969(Jan), Vol. 46(1), 22-30.—Based on interviews with executives, and search and employment agents, the role of the motivating factors of money, status, and recognition in inducing employees to change jobs is examined.

9094. Salas, R. G. **A survey of attitudes held towards the Royal Australian Army Nursing Corps: II. Other ranks attitudes.** *Australian Military Forces Research Report*, 1970(Jan), No. 1-70, 49 p.—Surveyed the opinions of other-rank members of the Royal Australian Army Nursing Corps by questionnaire on a range of topics relevant in the formation of attitudes towards conditions of service and the reengagement

decision. Responses reveal that a low level of satisfaction with army life was possessed by Ss and a correspondingly low rate of intended reengagement. It is concluded that disaffection is largely based on a perceived lack of career advancement opportunities. In terms of reengagement, data reflect the pattern observed in earlier studies, i.e., that younger members tended to favor reengagement to a lesser degree than older members.—*Journal abstract.*

9095. Schein, Virginia E. (New York U.) **The relationship between accuracy of subordinate's perception of his supervisor and job performance.** *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-B), 1581-1582.

9096. Schneider, Benjamin & Olson, Loren K. (Yale U.) **Effort as a correlate of organizational reward system and individual values.** *Personnel Psychology*, 1970(Fal), Vol. 23(3), 313-326.—Explores several hypotheses concerning the effect of different reward systems and the amount of effort expended by employees. Based upon the path-goal theory, which assumes that behavior will occur to the extent the individual perceives some positive correlation between his behavior and the probability of attaining the goal, several hypotheses were established. 2 hospital nursing staffs—one under a seniority pay system and the other under an incentive pay system—constituted the comparison groups. A 7-point rating scale was used to measure the amount of effort expended by individuals in their job performance. Porter's Need Satisfaction Questionnaire was also administered to provide measures of the importance of intrinsic and extrinsic rewards. Results supported the hypothesis that different reward systems produce different amounts of effort expended. The incentive system employees had a higher average effort score. There also appeared to be a positive relationship between valued intrinsic rewards and effort in an incentive pay system. (22 ref.)—*D. Dieterly.*

9097. Scott, William E. & Rowland, Kendrith M. (Indiana U.) **The generality and significance of semantic differential scales as measures of "morale."** *Organizational Behavior & Human Performance*, 1970(Nov), Vol. 5(6), 576-591.—Obtained responses to a battery of experimental semantic differential scales from 262 employees in an ammunition depot. Responses were factor analyzed and the factor structure was compared with that obtained in a previous study utilizing a different sample from an industrial organization. Factors accounting for the largest proportion of variance in both cases were reasonably congruent across both samples. Theoretical views regarding the nature and significance of the factors are presented. (26 ref.)—*Journal abstract.*

9098. Shenk, Faye. **Career Indications among junior officers.** *USAF AFHRL Technical Report*, 1969(Sep), No. 69-33, 12 p.—Reports a historical study of officer input from the principal Air Force commissioning programs designed to determine the predictability of an Air Force officer's career decision and to evaluate relationships between career intent and various demographic, environmental, and attitudinal factors. Information on this group (N = 5600) was compiled for the period prior to commissioning and through 3 yr. of active duty. Based on the expressed career intent, the most favorable sources for retention were found to be Officer Candidate School and Officer Training School-Airman Education and Commissioning Program; officers from both of these sources have had

prior service experience. The yearly responses to the career-intent statement indicated a decline in career intent at least through the 1st years of military service. Job characteristic factors considered important and attainable were also examined. Factors considered most important centered around job satisfaction, e.g., working under competent supervisors, having a sense of accomplishment, and having an opportunity for advancement. Least important values were represented by such factors as early retirement, travel, and having a definite work schedule. In general, the perceived importance of a reward or working condition shows little relationship to the perceived possibility of achieving that factor. In fact, the greater the discrepancy between the importance and possibility of given factors, the more likely a S is to have an unfavorable attitude.—*Journal abstract.*

9099. Sorcher, Melvin. **Motivation on the assembly line.** *Personnel Administration*, 1969(May), Vol. 32(3), 40-48.—Attempted to test previous findings concerning (a) an S's understanding of his role in the business, and (b) the opportunity to participate in group decisions. 9 male and 6 female employees (Group 1) and 125 female employees (Group 2) served as Ss. The redesign of the job environment for both groups is described. Mean average performance over a 10-wk period before the program implementation was compared with the mean performance for 10 wk. following the redesign. 5 factors were measured: absenteeism, tardiness, quality, efficiency, and actual dollar savings. Results suggest "better job understanding followed by a commitment to a self-established goal does appear to motivate individuals to improve their performance."—*P. McMillan.*

9100. Trahair, Richard C. (U. Melbourne, Carlton, Victoria, Australia) **The workers' judgement of pay and additional benefits: An empirical study.** *Human Relations*, 1970(Jun), Vol. 23(3), 201-223.—Studied workers' attitudes and judgments regarding pay and additional benefits in the Australian mining industry. 3 general conclusions are drawn: (a) it is shown that the classification system based on pay and additional benefits covers the points to which workers refer when making their judgments; (b) the amount of pay, contract system of work payment, and work facilities were judged in reference to features of the job context; the lead bonus, amenities scheme, and recreational facilities were judged in reference to factors outside the job situation (the assumed reason is that the 1st 3 provide conditions for distinguishing job status and the latter 3 do not); and (c) workers' acceptance of pay and additional benefits depends on the extent to which they provide control in the job context. (18 ref.)—*W. W. Meissner.*

9101. Wood, Donald A. (Indiana U.) **The feasibility of a discrepant approach in assessing job attitudes.** *Organizational Behavior & Human Performance*, 1970(Nov), Vol. 5(6), 555-575.—Factor analyzed responses to various job characteristics concerning both their importance and perceived presence for 2 samples of engineers and scientists (N = 3234). The resulting dimensions emerging from the 2 response instructions were compared using congruency coefficients. Importance and presence factor components on the same attitudinal dimension were highly congruent within both groups. A general satisfaction factor was more allied with the perceived presence of these characteristics than their value or importance. Replication of factors across samples was best in the areas of job security, job autonomy, job status, and supervisory relations and

poorest in areas of professional recognition and challenge. Structural discrepancies were attributed to population characteristic differences between a university alumni sample and a national survey. Similarities found between work value structure and the presence of job characteristics suggest a feasible basis for utilizing an interactionist framework in a reformulation of job satisfaction theory. (35 ref.)—*Journal abstract*.

MANAGEMENT & ORGANIZATION

Va.) **The problem of motivation in management development.** *Personnel Journal*, 1970(Oct), Vol. 49(10), 837-842.—Explores reasons why managers exhibit resistance to development programs, and discusses other problems encountered in motivating managers to achieve through management development programs their goal of becoming better managers.—*Journal abstract*.

9106. Farris, George F. (Massachusetts Inst. of Technology, Sloan School of Management) **The drunkard's search in behavioral science.** *Personnel Administration*, 1969(Jan), Vol. 32(1), 10-18.—Attempts to dispel myths "regarding the application of behavioral science to management" illustrated by the Hawthorne studies. Current trends in behavioral science include "better research methods, interdisciplinary collaboration, international studies, more work at higher organizational levels, and open systems theory." A study by Marrow, Bowers, and Seashore illustrates the new approach. (15 ref.)—G. Steele.

9107. Goodman, Richard A. (U. California, Graduate School of Business Administration, Los Angeles) **Organizational preference in research and development.** *Human Relations*, 1970(Aug), Vol. 23(4), 279-298.—Presents data from interviews with managers in 6 companies with mean experience in management of research and development of 16.5 yr. It is concluded that: (a) Project managers prefer the project form of organization, while general managers prefer line-staff or matrix form. (b) The 3 most important criteria for organizational design are clear location of responsibility, ease and accuracy of communication, and effective cost control; the 3 least important are providing a clear path for individual promotion, organizational form desired by customer, and relative size of the project. (c) By ranking ability of each form to satisfy criteria for design, it was

shown that opinions of general managers did not develop a "best" organizational form. But in the opinions of project managers, the project form was significantly better.—W. W. Meissner.

9108. Kavanagh, Michael J., MacKinney, Arthur C., & Wolins, Leroy. (State U. New York, Binghamton) **Issues in managerial performance: Multitrait-multimethod analyses of ratings.** *Psychological Bulletin*, 1971(Jan), Vol. 75(1), 34-49.—Examines 3 general issues of dimensionality, validity, and content of ratings of managerial performance in terms of "relevance to the ultimate criterion." It is argued that the multitrait-multimethod design yields the best evidence for investigating these issues. An analysis of variance model with computational formulas for the sums of squares and variance components based on the correlation matrix is proposed for the multitrait-multimethod situation. Using this model, data from 2 studies are examined and compared, relative to convergent and discriminant validity, method bias (halo), and error variance. It appears that this model and the indexes derived from it provide a more simplified and interpretable technique for analyzing and summarizing multitrait-multimethod data. A procedure to improve performance ratings based on partitioning the original matrix is illustrated with an example from the larger data set. (37 ref.)—*Journal abstract*.

9109. Lawrie, J. W. (Wabash Coll.) **Leadership and magical thinking.** *Personnel Journal*, 1970(Sep), Vol. 49(9), 750-756.—The "motivator-leader" model often is a highly prized concept by executives. The "myth" of "leadership ethic" is described in terms of leader, followers, and the organization. Another model of leadership, i.e., diagnostic leadership (DL), is suggested as an alternative. The diagnostic leader must (a) charismatically lead, (b) know that motives are intrinsic, (c) recognize that intercommunications must exist, (d) know that personal and organization motives are not always compatible, and (e) recognize his role as an ecological manipulator.—P. L. Crawford.

9110. Lundberg, Craig C. (Southern Methodist U., School of Business Administration) **Managerial behavior in a crisis.** *Personnel Journal*, 1970(Oct), Vol. 49(10), 847-850, 860.—Compared observed behaviors of a small plant manager under normal and crisis conditions. The behaviors generally consisted of verbal and nonverbal contacts.—P. L. Crawford.

9111. Meyer, Herbert H. **The validity of the In-Basket Test as a measure of managerial performance.** *Personnel Psychology*, 1970(Fal), Vol. 23(3), 297-307.—A plant manager In-Basket Test was developed and administered to 81 unit managers in the manufacturing sections of 7 departments. The In-Basket Test was evaluated upon 50 dimensions and reduced to 27 dimensions which were further factor analyzed by the centroid method to provide a 4-factor measure. A performance rating was used as the criterion. It was factored into 2 dimensions: supervision and planning-administration. The validities of the In-Basket Test proved to be higher for the factor of planning-administration. In a cross-validation on 45 additional unit managers the predictive validity of the scores keyed against the planning-administration factor was significant. In a 2nd comparison, a group of 165 men with no managerial experience were tested and studied with the original manager group. Age in both groups correlated negatively with In-Basket scores, and education level

correlated positively. The face validity of the In-Basket Test and its apparent validity in predicting 1 aspect of manager performance demonstrates its potential value as a selection device.—D. Dieterly.

9112. Miner, John B. (U. Maryland) **Psychological evaluations as predictors of consulting success.** *Personnel Psychology*, 1970(Fal), Vol. 23(3), 393-405.—Presents a series of 7 studies each of which bears upon the validity of decisions made by consultants in making psychological evaluations of management candidates. The criteria are tenure, mean increase in compensation rate, and performance ratings. The psychological evaluation was measured in terms of the final recommendation made by the consulting agency (a 5-point scale). None of the studies supported the contention that the psychological evaluation recommendation added significantly above chance in predicting the 3 criteria.—D. Dieterly.

9113. Morsh, Joseph E. **Survey of Air Force officer management activities and evaluation of professional military education requirements.** *USAF AFHRL Technical Report*, 1969(Dec), No. 69-38, 86 p.—Surveyed officer management to identify functions which all officers perform as distinct from work specific to a particular specialty, to determine the relationships of managerial responsibility to grade, career area, or other variables, and to obtain an evaluation of topics of professional military education requirements in terms of job performance or as contributory to an effective Air Force career. The world-wide survey included 10,242 Air Force officers in grades 2nd lieutenant through colonel. An officer management inventory was administered in 19 major commands using conventional sample survey procedures. In the subsequent analysis by means of the Personnel Research Division job-clustering program, management job types were not clearly differentiated. The extent of managerial responsibility was shown to be directly related to grade. Field-grade officers performed, on the average, 4 times as many managerial tasks as company-grade officers. Consolidated descriptions of management tasks performed were published for staff, field-grade, and company-grade officers in each of 9 career areas. While some differences in emphasis were found, officers in the several career areas tended to allocate more or less the same percentage of their jobs to tasks falling in each of the management categories. Group difference descriptions were computed to highlight some of the major career ladder managerial differences. In evaluating 128 professional military education requirements topics, officers of all grades indicated a substantial need on the job for principles and techniques of leadership; oral and written communication; techniques of logical and of creative thinking; problem solving procedures; officer ethics; discipline and morale; military customs, courtesies, and ceremonies; and security of classified military documents and equipment.—*Journal abstract*.

9114. Nouri, Clement J. & Fridl, James J. (Marquette U., Coll. of Business Administration) **The relevance of motivational concepts to individual and corporate objectives.** *Personnel Journal*, 1970(Nov), Vol. 49(11), 900-906.—Describes various theories of motivation in relation to the accomplishment of corporate goals and achievements. The profit motive, mutually consistent goals, McGregor's Theory X (which is reflected in conventional "organization structures, managerial policies, practices, and programs"), and Theory Y (which

"holds that management is responsible for organizing the firm's resources in the interest of economic ends"), etc., are discussed.—P. L. Crawford.

9115. Ritchie, J. B. & Miles, Raymond E. (U. Michigan) **An analysis of quantity and quality of participation as mediating variables in the participative decision making process.** *Personnel Psychology*, 1970(Fal), Vol. 23(3), 347-359.—Items were selected from a Management Decision Making, Attitude and Job Satisfaction Questionnaire to measure 3 variables: perceived participation, superior's attitudes toward their subordinates' capabilities, and satisfaction with immediate supervision. 2 hypotheses, drawn from Lowin's Participative Decision Making process, maintained that managers' satisfaction with their immediate superior will vary directly with the extent to which they feel they are consulted by their superiors, and the extent to which their capabilities are valued by their superior. Ss were 330 managers from 5 levels of operating divisions of a West Coast firm. The results supported both hypotheses using an analysis of variance design.—D. Dieterly.

9116. Schwartz, Milton M., Stark, Harry F., & Schiffman, H. R. (Rutgers State U.) **Responses of union and management leaders to emotionally-toned industrial relations terms.** *Personnel Psychology*, 1970(Fal), Vol. 23(3), 361-367.—A 19-concept semantic differential was developed using 9 evaluative scales on emotionally toned industrial relation terms. The scales were administered to 4 groups, 2 levels of union members and 2 levels of management. In an analysis of variance of median ranks the following conclusions were supported: (a) there was more agreement by the 2 management groups than the 2 union groups, (b) the lower levels of union and management differ more often than the 2 higher levels, and (c) certain words were rejected by both labor and management groups (e.g., featherbedding, wildcat, etc.).—D. Dieterly.

9117. Stogdill, Ralph M. & Coady, Nicholas P. (Ohio State U.) **Preferences of vocational students for different styles of supervisory behavior.** *Personnel Psychology*, 1970(Fal), Vol. 23(3), 309-312.—5 scales of the Ideal form of the Leader Behavior Descriptive Questionnaire were administered to 2 groups of students from different vocational high schools. The questionnaire yielded scores on 5 dimensions: (a) representation, speaks and acts as the representative of the group; (b) consideration, is considerate of members' welfare and comfort; (c) structure, lets members know what is expected of them and what they can expect; (d) tolerance of freedom, tolerates member freedom for decision and action; and (e) production emphasis, pushes for high level of output. It was hypothesized, but not supported, that workers would prefer tolerance of freedom and consideration over structure and production emphasis. In both schools the dimensions of consideration and structure produced a higher mean score than the other 3 dimensions.—D. Dieterly.

9118. Vendrov, E. E. **Psikhologicheskie problemy upravleniya.** [Psychological problems of management.] Moscow, USSR: Ekonomika, 1969. 160 p.—Examines a number of problems dealing with factors, e.g., (a) the formation of managerial authority, (b) the development of an individual approach to subordinates, (c) the psychology of the managerial personality, and (d) the selection of managerial personnel.—I. D. London.

9119. Weaver, Jerry L. (California State Coll., Center for Political Research, Long Beach) **Value patterns of a**

Latin American bureaucracy. *Human Relations*, 1970(Jun), Vol. 23(3), 225-233.—Studied the attitudes toward reform in 244 Guatemalan bureaucrats. Continued employment and showing that opinions were right had high priority. Education, skill, and training had low value. Risk-taking and innovation were widely avoided. Professional, supervisory, and executive personnel have stronger commitment to public service as a career and are more willing to express dissatisfaction and criticism than subordinates. "But let us argue... that legalism, formalism, and indecision are defense mechanisms employed by insecure bureaucrats, bureaucrats who see no reason to value reform, who have developed procedures not with regard to efficiency, effectiveness, impersonalism, and other Weberian norms, but out of a primary concern for self-protection."—*W. W. Meissner*.

9120. **Webber, Ross A.** (U. Pennsylvania, Wharton School of Finance & Commerce) **Perceptions of interactions between superiors and subordinates.** *Human Relations*, 1970(Jun), Vol. 23(3), 235-248.—Analysis of perceptions of 34 pairs of superior-subordinate pairs shows consistent distortions of perception of verbal interaction. Initiators tend to exaggerate, and receivers to underestimate the volume of interaction. Superiors exaggerate initiation downward while subordinates underestimate this interaction. Passive personalities exaggerate all interactions, whether initiated or received. Despite different behavior patterns between authoritarian and supportive managers, subordinates do not perceive any significant difference in interactions. (22 ref.)—*W. W. Meissner*.

SPECIAL ENVIRONMENTS

9121. ———. **Annotated bibliography of reports issued by the Naval Aerospace Medical Institute, Pensacola, Florida, 1 January 1964-1 July 1968** Pensacola, Fla.: USN Aerospace Medical Inst., 1968. v, 112 p.

9122. **Kanda, Hiroshi; Oguro, Hideo, & Ohara, Takehumi.** [Fundamental frequency of signal sound and audible distance.] *Journal of Science of Labour*, 1970(Feb), Vol. 46(2), 80-125.—Considers, in estimating the audible distance of the signal sounds issued from ships, the divergence decrease due to the spreading of sound waves from a point source, the masking effect of environmental noise on the signal sound, and the attenuation due to absorption and the shadow zone created by the bending of sound waves caused by atmospheric conditions. When the environmental noise of the side of the source signal sound is too loud, the signal sound is masked by the environmental noise and it cannot be heard unless it has an adequate SPL. Results suggest that ship's signal sounds with a higher fundamental frequency than that used by ships in the past are necessary for more effective signaling.—*English abstract*.

9123. **Marishchuk, V. L., Platonov, K. K., & Pleznitskii, E. A.** *Napryazhennost' v polëte.* [Tension in flight.] Moscow, USSR: Military Publishing House, 1969. 119 p.—Examines the results of studies to determine the reasons for the development of tension in flight and devise methods for its prevention and elimination.—*J. D. London*.

9124. **Weltman, Gershon; Christianson, Raymond A., & Egstrom, Glen H.** (U. California, Los Angeles) **Effects of environment and experience on underwater work performance.** *Human Factors*, 1970(Dec), Vol. 12(6), 587-598.

ADVERTISING & CONSUMER PSYCHOLOGY

9125. **Berdy, David.** **Order effects in taste tests.** *Journal of the Market Research Society*, 1969(Oct), Vol. 11(4), 361-371.—Despite systematic rotation, a product that is presented first is about twice as likely to be preferred as the product tasted second. Some aspects of the order effect phenomenon in taste tests are examined, data being drawn from 6 tests using cakes and breakfast cereals. Alternative test designs are discussed and the validating data for 1 of these is presented as an example of how to virtually eliminate order effects. (18 ref.)—*A. R. Howard*.

9126. **Ehrenberg, A. S.** (London Graduate School of Business Studies, England) **Towards an integrated theory of consumer behaviour.** *Journal of the Market Research Society*, 1969(Oct), Vol. 11(4), 305-337.—Attempts to "draw together various relatively isolated laws of consumer behaviour" in order to provide a degree of generalization or integration to the field. Examines buyer behavior, media consumption, consumer attitudes, quality factors, and methodology, and discusses practical applications in each of these areas. (100 ref.)—*A. R. Howard*.

9127. **Green, Paul E., Maheshwari, Arun, & Rao, Vithala R.** (U. Pennsylvania) **Self-concept and brand preference: An empirical application of multidimensional scaling.** *Journal of the Market Research Society*, 1969(Oct), Vol. 11(4), 343-360.—Examines the relationship of image congruity to brand perception and preference for automobile models and the usefulness of multidimensional scaling methodology in this area. 45 graduate business students responded to automobile brands and to semantic differential scales. It was found that image congruence and brand preference are not necessarily positively related. Suggestions for additional research and comments on methodological limitations are offered.—*A. R. Howard*.

9128. **McFall, John.** (San Diego State Coll.) **Priority patterns and consumer behavior.** *Journal of Marketing*, 1969(Oct), Vol. 33(4, Pt. 1), 50-55.—Products acquired by consumers over life-cycle periods can be grouped into clusters in accordance with set criteria. It is shown how marketing strategy can be made more effective by adopting a cluster approach to product sets. A technique is outlined for defining the characteristic sets of consumer durables and the consumer priority patterns related to their acquisition. It is concluded that market segmentation for durable goods should be conducted on the basis of income, social class, and other socioeconomic variables, as well as on the basis of the priority patterns of acquisition of the relevant consumer groups.—*Journal abstract*.

9129. **Schlinger, Mary J.** (U. Illinois, Chicago Circle) **Responses to advertising: Varieties of liking and disliking.** *Journalism Quarterly*, 1970(Spring), Vol. 47(1), 46-56.—Defined 4 patterns of reaction to well-liked commercials and 5 modes of reaction to disliked commercials. Female respondents were asked to think of a recent liked and a recent disliked ad, reply to a series of open-ended questions about the content of each ad, and describe each ad on a series of 36 adjectival rating scales. An R factor analysis yielded evaluation-attractiveness, activity, coherence, and affective-potency dimensions. Inverse factor analysis of response to "liked" ads yielded empathic, spectator (entertainment without self-involvement), fantasy-escapist, and disinterested "nonresponse"

types. Inverse factor analysis of responses to "disliked" ads yielded detached, angry, disappointed brand users, moralistic, and taste critic types. The study suggests a useful approach to learning how consumers experience advertisements. All but 5% of the ads mentioned came from TV.—*J. A. Kline.*

9130. **Wills, Gordon; Lumb, Frederick, & Wilson, Richard M.** (U. Bradford, Management Centre, England) **Vector analysis of buyer behavior.** *Journal of the Market Research Society*, 1969(Jul), Vol. 11(3), 214-234.—Cites the major strengths and weaknesses of Lewin's "vector hypothesis" for analyzing buyer behavior, and presents the findings of a study of British Railways illustrating the effective use of vector analysis techniques. (18 ref.)—*A. R. Howard.*

9131. **Winters, Lewis C. & Wallace, Wallace H.** **On operant conditioning techniques.** *Journal of Advertising Research*, 1970(Oct), Vol. 10(5), 39-45.—Reviews operant conditioning techniques in advertising research, emphasizing "the reliability and validity of such techniques in measuring advertising effectiveness." Data indicate that operant conditioning is a "reliable and valid measure of attention or interest... but does not necessarily predict attitude change." (18 ref.)—*J. C. Franklin.*

ENGINEERING PSYCHOLOGY

9133. ———. **Milestones: A directory of Human Engineering Laboratories publications, 1953-1968.** Aberdeen Proving Ground, Md.: Aberdeen Research & Development Center, 1969. iii, 111 p.

9134. **Farr, M. J.** (Office of Naval Research, Psychological Sciences Div., Washington, D.C.) **L'extension de l'homme par les systèmes homme-machine.** [Extension of the man by man-machine systems.] *Revue de Psychologie et de Sciences de l'Education*, 1970, Vol. 5(3), 286-301.—Discusses the cybernetic-like man-machine systems, where the machine is an extension of man, amplifying his physical capabilities, i.e., strength, reach, endurance, and flexibility. Some definitions of new terms are given, and 2 "man amplifiers" are examined: the 2-arm master-slave manipulator, called Handyman, and the full-scale, powered

exoskeleton, called Hardiman. Manipulation, capability, mobility, and other performance aspects are discussed. Example of orthotic device, the Myotron, a powered brace fitted around the paralyzed limb, allows adapted exercising and objective measurement of muscle power. Finally, applications of teleoperators in remote control are presented, e.g., in spatial research. (Dutch summary) (18 ref.)—*English summary.*

Displays & Controls

DRIVING & SAFETY

9136. **Hakkinen, S.** (Inst. of Occupational Health, Helsinki, Finland) **Le comportement du conducteur.** [Driver behavior.] *Revue de Psychologie et de Sciences de l'Education*, 1970, Vol. 5(3), 243-267.—Presents a short summary of some of the human factors affecting driver behavior. An analysis of the driving task is discussed using a 3-phase system: perception, decision, and performance. Some features of the perception process are presented along with the results of studies which demonstrate the existence of a limited channel system. Typical errors in the estimation of distance and speed and its effect on a dangerous behavior while passing are shown. The lack of an immediate feedback system during training and in traffic generally may be 1 reason for erroneous and inadequate driver behavior. (Dutch summary) (24 ref.)—*English summary.*

9137. **Hertz, D.** (Hadassah U. Hosp., Jerusalem, Israel) **Bdikat kavey ishlut b'morave; teunot derachim.** [Personality factors in automobile accidents.] *Harefuah*, 1970(Aug), Vol. 79(4), 165-167.—Examined 35 men involved in car accidents in a structured, 3-stage psychiatric interview. Possible correlations between past life experiences, behavior pattern, and hostile tendencies of the driver were investigated. For 11 of the 35 Ss the findings indicate that drivers with poorer control of hostility and with lower tension tolerance seem to be more susceptible to motor vehicle accidents. The structured, goal-directed psychiatric interview could be useful as a helpful diagnostic tool for the detection of personal factors affecting accident frequency.—*English summary.*

Brief Subject Index

This index supplements the classification of abstracts given in the Table of Contents, and is designed to lead the reader to subjects that are more specific than the general categories of the classification. When many abstract numbers are listed under a heading, the reader may simplify his task by matching the numbers found under the two or more headings that specify his particular interest.

 7946, 7948, 7949, 7950, 7951, 7952, 7953,
 7986, 8882, 8905, 8923, 8970
Chlordiazepoxide (SEE Tranquilizer)
Chlorpromazine
 7517, 7610, 7623, 7659, 7663, 7665, 7675,
 8412, 8416, 8438, 8650, 8656
Choice Behavior (see also Decision Making,
 Learning/Probability)
 7171, 7310, 7318, 7347, 7354, 7357, 7433,
 7434, 7435, 7758, 7876
Chromosome (SEE Genetics)
City (SEE Urban & Suburban Environment)
Civil Rights (SEE Social Movements, Inte-
 gration, Law)
Class (SEE Social Structure, Socioeconomic
 Status)
Classical Conditioning (SEE Conditioning/
 Classical)
Classification (see also Selection, Categorical
 Behavior)
 7222, 7245, 7423, 7485, 8487, 8492, 8493,
 8723, 8928
Classroom (see also Education, School, Teach-
 ing)
 8440, 8907, 8908, 8929, 8973, 8978, 9007,
 9018, 9022, 9027
Cleft Lip & Palate (SEE Speech/Defective)
Clergy (SEE Religion)
Client-Centered Therapy (SEE Psychothera-
 py/Methods in)
Climate (SEE Environment, Temperature)
Clinic (see also Community Services, Hospital,
 Treatment/Outpatient)
 8278, 8297, 8308, 8502, 8730, 8823
Clinical Judgment (see also Psychodiagnosis)
 8275, 8432, 8502, 8615
Clinical Psychology
 7159, 7195, 7212, 8263, 8275, 8295, 8299,
 8300, 8517
Cluster Analysis (SEE Factor Analysis, Sta-

- tistics)
Coalition Formation (SEE Group/Small)
Cochlea (SEE Ear)
Coding (SEE Categorical Behavior, Problem Solving, Display)
Cognition (see also Thinking, Categorical Behavior)
 7178, 7283, 7420, 7427, 7844, 7880, 7904, 7912, 7962, 7989, 8284, 8772, 9014, 9016, 9089
Cognitive Dissonance (SEE Attitude Change, Dissonance)
Cognitive Style
 7334, 7424, 7431, 7947, 7997, 8036, 8919, 8948, 8954
Coltus (SEE Sexual Behavior, Sexual Behavior-Animal)
Cold (SEE Temperature)
College (see also Education, School, Student/College)
 7201, 7207, 8017, 8105, 8117, 8192, 8875, 8877, 8878, 8893, 8902, 8904, 8950, 8955, 8959, 8961, 8962, 9003, 9006
College Counseling (SEE Counseling, Guidance/Educational, Guidance/Vocational)
College Student (SEE Student/College)
College Success (SEE Achievement/Academic-College)
Color (see also Color Vision)
 7289, 7746, 7834, 7881
Color Vision
 7301, 7302, 7303, 7304, 7305, 7306
Communication (see also Communication/Nonverbal, Information, Language, Speech, Verbal Behavior)
 7207, 7209, 7227, 7230, 7817, 7820, 7859, 7950, 7951, 8041, 8090, 8131, 8133, 8136, 8140, 8155, 8159, 8161, 8162, 8169, 8172, 8187, 8330, 8335, 8347, 8386, 8447, 8454, 8625, 8666, 8696, 9008
Communication/Animal (SEE Communication, Vocalization)
Communication/Mass (see also Television, Advertising)
 9126
Communication/Nonverbal
 8125, 8145, 9038
Community (see also Culture, Group)
 7234, 8067, 8087, 8117, 8136, 8343, 8409, 8810, 8832, 8864, 9003
Community Services (see also Clinic, Mental Health)
 7865, 7998, 8057, 8272, 8299, 8530, 8573, 8676, 8677, 8684, 8856, 8857, 8858, 8859, 8860, 8861, 8862, 8863, 8865, 8866, 8867, 8868, 8901
Comparative Psychology (see also Animal Psychology)
 7491, 7629, 7728, 7729, 7730, 7731, 7732, 7733, 7734, 7735, 7736, 7737, 7738
Competition (see also Conflict, Cooperation, Motivation)
 7409, 8886
Complexity (see also Cognitive Style, Stimulus)
 7308, 7407, 7431, 7918
Comprehension (see also Thinking, Reading)
 7372, 7925, 8175, 8757, 8767, 8980
Compulsion (SEE Obsession-Compulsion)
Computer
 7159, 7209, 7225, 7226, 7227, 7228, 7229, 7230, 7237, 7313, 7488, 7586, 8170, 8427, 8497, 8547, 8744, 9011, 9020, 9028, 9032, 9135
Concentration Camp (SEE Prison, War)
Concept (see also Childhood/Concepts & Problem Solving in, Concept Formation, Thinking)
 7366, 7367, 7431, 7432, 7732, 7760, 7997, 8039, 8240, 8826, 8983
Concept Formation (see also Childhood/Concepts & Problem Solving in)
Conditioned Emotional Response
 7709, 7712, 7770
Conditioned Galvanic Skin Response (SEE Galvanic Skin Response)
Conditioned Reflex (SEE Conditioned Response, Reflex)
 7258, 7356, 7375, 7462, 7485, 7500, 7515, 7519, 7551, 7575, 7584, 7587, 7613, 7706, 7723, 7753, 7762, 7764, 7767, 7768, 7773, 7775, 7776, 7777, 7778, 7802, 7804, 7995
Conditioning (see also next headings)
 7377, 7492, 7551, 7656, 7768, 7776, 7793, 7856, 8315, 8589, 8623, 8938
Conditioning/Avoidance (SEE Learning/Avoidance, Rat/Avoidance & Avoidance Learning in)
Conditioning/Classical
 7377, 7380, 7523, 7769, 7772, 7773, 7777, 7779
Conditioning/Escape (SEE Escape)
Conditioning/Eyefield
 7380
Conditioning/Interceptive
 7440, 7523, 7619, 7697, 7775
Conditioning/Operant (see also Rat/Conditioning in)
 7373, 7376, 7379, 7590, 7762, 7766, 7773, 7777, 7778, 7780, 7783, 7796, 8394, 8655, 9131
Conditioning/Verbal (SEE Learning/Verbal)
Conference (SEE Symposium)
Confidence Judgment (SEE Certainty)
Conflict (see also Frustration, Learning/Avoidance, Interpersonal Processes)
 7196, 7751, 7938, 7970, 7978, 7997, 8003, 8026, 8041, 8068, 8075, 8110, 8140, 8631, 8901, 8908, 9037, 9082
Conformity (see also Authoritarianism, Dominance, Expectation, Interpersonal Influence, Social Influence)
 7946, 7977, 8127, 8130, 8137
Congress (SEE Symposium)
Connotation (SEE Meaning, Semantics)
Conscience (SEE Value & Values, Ethics, Motivation)
Conscious States (see also Awareness)
 7172, 7208, 7226, 8762
Conservation (SEE Childhood/Concepts & Problem Solving in)
Conservatism (SEE Political Behavior, Personality Trait)
Consonance (SEE Dissonance)
Constancy (SEE Gestalt Psychology, Visual Perception, Perception)
Consumer Behavior (see also Advertising)
 9125, 9126, 9127, 9128, 9129, 9130
Contagion (SEE Interpersonal Influence, Social Influence)
Content (SEE Information, Meaning)
Context
 7212, 7322, 7365, 7903
Contraception (SEE Birth Control)
Contribution & Criticism
 7218, 7221, 7261, 7277, 7285, 7286, 7295, 7298, 7334, 7342, 7346, 7370, 7379, 7383, 7388, 7413, 7452, 7717, 7720, 7898, 7912, 8018, 8089, 8163, 8245, 8249, 8260, 8468, 8763, 8992, 9037
Control (see also Display)
 7770, 7786, 8069, 8220
Control/Internal-External
 7933, 7979, 8061, 8093, 8561
Convulsion (SEE Electroconvulsive Shock, Nervous System/Disorder of, Epilepsy)
Cooperation
 7313, 8138, 8149, 8153
Coordination (SEE Motor Performance)
Coping Behavior (SEE Adjustment/Personal & Social)
Copulatory Behavior (SEE Sexual Behavior-Animal)
Correlation (see also Factor Analysis, Statistics)
 7217, 7220, 7224, 8243, 8247
Cortex (SEE Cerebral Cortex, Visual Cortex)
Counseling (see also Guidance/Educational, Guidance/Vocational, Interview)
 7865, 8266, 8269, 8529, 8547, 8689, 8690, 8691, 8692, 8693, 8695, 8697, 8698, 8699, 8700, 8701, 8702, 8704, 8798, 8842, 8941, 8947, 8953, 8955, 8957, 8958, 8959, 8960
Counseling/College (SEE Guidance/Educational, Guidance/Vocational)
Counselor
 8303, 8688, 8694, 8696, 8864, 8948, 8952, 8954, 8957, 8959
Countertransference (SEE Interpersonal Processes, Psychotherapy, Psychoanalysis, Therapeutic Process)
Counting (SEE Mathematics, Number)
Court (SEE Law, Crime & Criminals)
Courtship (SEE Interpersonal Attraction)
Creativity (see also Aesthetics, Gifted, Literature, Music, Thinking)
 7425, 7428, 7596, 7932, 8120, 8236, 8237, 8238, 8239, 8307, 8614, 8999
Credibility (SEE Experimentation & Experiments, Interpersonal Influence, Social Perception)
Crime & Criminals (see also Delinquency/Juvenile, Law, Prison)
 7990, 8063, 8064, 8086, 8250, 8289, 8316, 8455, 8518, 8537, 8538, 8539, 8540, 8541, 8542, 8544, 8545, 8546, 8561, 8578
Crisis & Crisis Intervention (see also Community Services, Emotion)
 8082, 8192, 8289, 8298, 8308, 8378, 8530, 8540, 8548, 8862, 9110
Critical Flicker Fusion (SEE Vision)
Criticism (SEE Contribution & Criticism)
Cross-Cultural Differences (see also Culture, Cultures & Countries)
 7834, 7870, 7910, 7913, 8034, 8035, 8036, 8037, 8038, 8039, 8040, 8041, 8042, 8147, 8533
Cue
 7361, 7364, 7368, 7392, 7428, 7771, 7887, 7918, 8763
Cultural Anthropology (SEE Culture)
Cultural Disadvantage (SEE Socioeconomic Status, Childhood/Disadvantaged)
Culture (see also Cultures & Countries, Ethnology, Social Influence)

- Genius** (SEE Gifted)
- Geriatrics** (see also Gerontology)
7984, 8611, 8869, 8870, 8871, 8872, 8873
- Germany**
7168, 8042, 8143, 8243, 8615
- Gerontology** (see also Geriatrics)
- Gestalt Psychology**

BRIEF SUBJECT INDEX

7161, 7186, 8020
Gifted
 7895, 7920, 8921, 8931
Gland (see also Epinephrine, Hormone)
 7439, 7467, 7477, 7493, 7494, 7495, 7499,
 7509, 7549, 7606, 7609, 7630, 7632, 7711,
 7713, 7715, 7723, 8747, 8752
Goal (SEE Motivation)
Goodenough Test (SEE Projective Technique)
Government
 7641, 7990, 8005, 8057, 8059, 8063, 8114,
 8450, 8522, 9085
Grades & Grade-Point Average (SEE Achieve-
 ment/Academic, Achievement/Academic-
 College, Achievement/Academic-Elementary
 School)
Grammar
 7365, 7403, 7891, 7902, 7907, 8163, 8166,
 8175, 8767, 8804
Graphology (SEE Writing)
Great Britain
 8034, 8035, 8042, 8250, 8546, 8818, 8975
Group (see also next headings, Community,
 Culture, Interpersonal Processes)
 8004, 8102, 8103, 8104, 8105, 8107, 8108,
 8113, 8114, 8120, 8124, 8128, 8130, 8132,
 8302, 8544, 8693, 8941, 8962, 8985, 9035,
 9099
Group Discussion
 8113, 8129, 8131, 8134, 8969
Group Dynamics
 8105, 8111, 8130, 8131, 8140, 8371, 8381,
 8858
Group Influence (SEE Social Influence)
Group Structure (SEE Group, Role)
Group Therapy (SEE Psychotherapy/Group)
Group/Ethnic (SEE Ethnicity)
Group/Small (see also Interpersonal Proc-
 esses)
 7213, 8111, 8115, 8121, 8129, 8150
Guidance (SEE next headings, Counseling)
Guidance/Child (SEE Psychotherapy/Child-
 ren, Guidance/Educational)
Guidance/Educational
 8510, 8951, 8952, 9006
Guidance/Vocational
 8685, 8950, 8952, 8956, 8960, 9045, 9048,
 9049
Guilt (SEE Emotion, Motivation)
Guinea Pig (SEE Animals)
Gustation (SEE Taste)

Habit (SEE Learning, Extinction)
Habituation
 7340, 7378, 7440, 7593, 7740, 7930
Hallucination
 8562, 8575
Hallucinogen (SEE Drugs, Lysergic Acid
 Diethylamide)
Halo Effect (SEE Rating Scale)
Hand (see also Body, Motor Performance)
 7445, 8739
Handedness (SEE Laterality)
Handicap (SEE Childhood/Handicapped,
 Physical Handicap, Blindness, Deafness &
 Hearing Disorder)
Handling (see also Experience/Early)
 7740, 7743
Handwriting (SEE Writing)
Headache (SEE Illness)
Hearing (SEE Audition)
Hearing Loss (SEE Audition, Deafness &
 Hearing Disorder)
Hearing/Hard of (SEE Deafness & Hearing
 Disorder)
Heart (see also Blood, Blood-Animal, Blood
 Pressure, Cardiovascular Processes, Heart
 Rate)
 7481, 7502, 7544, 7559, 7654, 7666, 9014
Heart Rate
 7339, 7340, 7425, 7447, 7523, 7676, 7694,
 7696, 7697, 7699, 7700, 7701, 7703, 7706,
 7727, 7750, 7773, 7775, 7799, 7843, 8142,
 9084
Heat (SEE Temperature)

Height (SEE Physique)
Helping Behavior (SEE Interpersonal Proc-
 esses)
Heredity (SEE Genetics)
High School (SEE School, Student/High
 School, Adolescence)
Higher Education (SEE College)
Hippocampus
 7451, 7515, 7519, 7543, 7577
History (see also Psychology/History of)
 7436, 7448
Hoarding (SEE Instinctive Behavior)
Homicide (SEE Crime & Criminals, Suicide)
Homosexuality
 8558, 8559, 8560, 8561
Honesty (SEE Deception)
Hormone (see also Epinephrine)
 7158, 7439, 7457, 7467, 7477, 7484, 7493,
 7509, 7510, 7521, 7610, 7622, 7624, 7625,
 7626, 7627, 7628, 7629, 7630, 7631, 7632,
 7638, 7654, 7655, 7674, 7682, 7711, 7715,
 8079, 8545, 8748
Hospital & Hospitalization (see also Clinic,
 Institution & Institutionalization, Mental
 Hospital & Hospitalization)
 8449, 8461, 8485, 8573, 8594, 8709, 8736,
 8831, 8853, 8872
Hostility (see also Aggression)
 7949, 8039, 8139, 8148, 8256, 8471,
 8597, 8603
Hue (SEE Color)
Human Engineering (SEE Engineering Psy-
 chology)
Humor (see also Literature, Language, Emo-
 tion)
 7857
Hunger (SEE Food Deprivation, Motivation)
Husband (SEE Marriage)
Hypnosis
 7332, 7333, 7334, 7335, 7336, 7337, 7460,
 8207, 8404, 8406, 8407, 8410, 8570, 8838
Hypnotherapy (SEE Hypnosis, Psychothera-
 py/Methods in)
Hypothalamus
 7451, 7466, 7471, 7477, 7479, 7486, 7493,
 7514, 7516, 7518, 7521, 7528, 7530, 7532,
 7534, 7535, 7537, 7541, 7542, 7543, 7544,
 7553, 7558, 7563, 7583, 7628, 7669, 7724,
 7726, 8747, 8748, 8750, 8752
Hysteria & Hysterics (see also Mental Dis-
 order, Neurosis, Psychosis)
 8537, 8538, 8590, 8595, 8600, 8604, 8613,
 8659

Id (SEE Psychoanalytic Theory)
Identification
 7358, 7431, 8112, 8255, 8480
Identity
 8008, 8010, 8339, 8620, 8859
Illegitimate Pregnancy (SEE Pregnancy, Moth-
 er)
Illness (see also Disease)
 8034, 8277, 8287, 8582, 8643, 8663, 8687,
 8835, 8835, 8836, 8839, 8843, 8848, 8850,
 8851, 8853, 8870, 9071
Illumination (SEE Brightness, Environment)
Illusion
 7268, 7269, 7270, 7271, 7272, 7273
Image (see also Self-Perception, Social Per-
 ception, Body)
 7291, 7292, 7315
Imagery
 7382, 7391, 7395, 7396, 7917, 8182
Imagination (SEE Fantasy, Cognition, Think-
 ing)
Imitation (see also Instinctive Behavior, In-
 terpersonal Processes, Model)
 7368, 7738, 7950, 8109, 8266, 8387
Impression Formation (SEE Social Perception)
Imprinting (SEE Instinctive Behavior, Ex-
 perience/Early)
Incentive (see also Motivation, Reward, Re-
 inforcement)
 7763, 7878, 7887, 7974, 9040, 9044, 9096
Incest (SEE Sexual Deviation)

Incidental Learning (SEE Learning)
Income (SEE Money, Socioeconomic Status)
Independency (SEE Dependency)
India
 7910, 8015, 8136, 8224, 8520, 8551, 8558
Indian/American (SEE Ethnicity)
Individual Differences
 7840, 8271, 8605
Industrial Psychology (see also Business, Per-
 sonnel/Industrial)
 7200, 7318, 9038, 9049, 9054
Industry (SEE Business, Personnel/Industrial)
Infancy (see also Neonate)
 7738, 7830, 7837, 7838, 7839, 7840, 7841,
 7842, 7843, 7844, 7845, 7846, 7847, 7848,
 7849, 7850, 7851, 7852, 7853, 7854, 7855,
 7856, 7857, 7970, 8273, 8470, 8483, 8485,
 8604
Influence (SEE Interpersonal Influence, Per-
 suasion, Social Influence)
Information (see also Communication, Infor-
 mation Theory, Language)
 7178, 7207, 7213, 7276, 7285, 7286, 7297,
 7319, 7354, 7359, 7367, 7411, 7422, 7596,
 7904, 7923, 8083, 8142, 8150, 8155, 8160,
 8187, 8205, 8640, 8769, 9029, 9053
Information Retrieval (SEE Information, Com-
 puter)
Information Theory (see also Information)
 7185, 7214, 7230, 7262
Inheritance (SEE Genetics)
Inhibition (see also Extinction, Interference)
 7338, 7360, 7376, 7384, 7408, 7482, 7492,
 7551, 7557, 7564, 7624, 7625, 7660, 7663,
 7677, 7679, 7682, 7684, 7707, 7784, 7827,
 8257, 8423, 8619
Inkblot (SEE Projective Technique, Rorschach
 Test)
Insect
 7158, 7716, 7739, 7746, 7815, 7818
Insecurity (SEE Dependency, Neurosis)
Insight (SEE Problem Solving, Thinking,
 Self-Perception, Social Perception, Thera-
 peutic Process)
Instinctive Behavior (see also Sexual Behav-
 ior-Animal)
 7734, 7738, 7744, 7745, 7746, 7818, 7823
Institute (SEE Organizations, College)
Institution & Institutionalization (see also
 Hospital & Hospitalization, Mental Hospi-
 tal & Hospitalization)
 7912, 8463, 8464, 8515, 8554, 8558, 8809,
 8816, 8873
Instruction (see also Teaching)
 8104, 9010, 9033
Instructions/Experimental
 7249, 7340, 7349, 7359, 7380, 7404, 7418,
 7737, 7872, 7925, 8083, 8160, 8827
Insulin (SEE Hormone)
Insulin Shock Therapy (SEE Therapy)
Integration
 7961
Intellectual Processes (SEE Cognition, Think-
 ing)
Intelligence (see also next headings)
 7225, 7366, 7408, 7879, 7962, 7981, 7982,
 8037, 8056, 8084, 8138, 8211, 8229, 8234,
 8235, 8567, 8737, 8769, 8808, 8997, 9059
Intelligence Quotient
 7873, 7879, 7924, 8207, 8228, 8232
Intelligence Tests & Testing (SEE Test/
 Intelligence)
Intensity (SEE Stimulus Intensity, Shock &
 Shock Intensity)
Interest (see also Motivation)
 8248, 8284, 9076
Interest/Vocational (SEE Occupational Inter-
 est)
Interference
 7315, 7360, 7368, 7381, 7384, 7393, 7403,
 7406, 7426, 7527, 7755, 7924
Internal-External Control (SEE Control/In-
 ternal-External)
International Relations
 8899
Interpersonal Attraction
 8016, 8096, 8099, 8117, 8118, 8141, 8362,

BRIEF SUBJECT INDEX

- 8363, 8907
Interpersonal Influence
 7864, 8050, 8115, 8127, 8135, 8137, 8155
Interpersonal Perception (SEE Social Perception)
Interpersonal Processes (see also Interpersonal Attraction, Interpersonal Influence, Group, Social Processes, Family Relations)
 7196, 7341, 7836, 7859, 7996, 8002, 8004, 8009, 8041, 8045, 8055, 8097, 8099, 8100, 8101, 8102, 8106, 8107, 8109, 8110, 8116, 8118, 8119, 8121, 8122, 8125, 8130, 8131, 8133, 8134, 8136, 8138, 8143, 8146, 8148, 8149, 8153, 8218, 8222, 8227, 8245, 8266, 8273, 8325, 8330, 8335, 8342, 8359, 8369, 8381, 8383, 8395, 8447, 8448, 8459, 8514, 8608, 8634, 8678, 8706, 8858, 8866, 8882, 8908, 8948, 8957, 8966, 8970, 9027, 9033, 9037, 9074, 9082, 9115, 9120
Interresponse Interval (SEE Interval/Time)
Intersensory Processes
 7267, 7788
Interval/Interstimulus
 7309, 7314, 7315, 7352, 7358, 7391, 7417, 7418, 7545, 7770, 7784, 7813, 7863, 8829
Interval/Time
 7275, 7280, 7405, 7527, 7697, 7802, 7808, 8158, 9125
Interview & Interviewing (see also Counseling, Guidance/Educational, Guidance/Vocational, Psychotherapy)
 7249, 8100, 8222, 8269, 8301, 8335, 8501, 8689, 8694, 8947, 8957, 9038, 9053
Introversion (SEE Extraversion-Introversion)
Intuition (SEE Thinking, Cognition)
Inventory (see also Questionnaire, Survey)
 7243, 8372, 8496, 8506, 8597, 8709, 8797, 9046, 9047, 9069
Isolation (see also Alienation)
 7419, 7587, 7609, 7820, 8013, 8199, 8410, 8463, 8664
Israel
 7998, 8924
Item (see also Test & Testing, Testing Methods)
 7232, 7238, 7239, 7241, 8040, 8083, 9013
Japan
 7881, 8020, 8036, 8071, 8405, 8975
Jew (SEE Religion, Ethnology)
Job (SEE next headings, Occupation, Personnel/Industrial, Work & Work Analysis)
Job Evaluation (SEE Occupation, Work & Work Analysis)
Job Performance
 8120, 8256, 8557, 9042, 9055, 9072, 9074, 9075, 9080, 9082, 9084, 9086, 9087, 9088, 9090, 9091, 9092, 9095, 9096, 9099, 9111, 9115
Job Satisfaction
 8120, 8461, 8961, 9078, 9079, 9083, 9084, 9085, 9088, 9089, 9090, 9093, 9094, 9097, 9098, 9099, 9100, 9101, 9103, 9115
Judgment
 7421, 7860, 7935, 8141, 8160, 8189, 8255, 9100
Judgment/Perceptual (see also Perception, the various senses)
 7298, 7306, 7346, 7414, 7877, 8135
Junior College (SEE College)
Junior High School (SEE School, Student/Junior High School)
Juvenile Delinquency (SEE Delinquency/Juvenile)
Kibbutz/Israel (SEE Israel)
Kindergarten (SEE Childhood/Preschool)
Kinesthesia (see also Movement)
 7267, 7443, 8630, 8933
Kinship (SEE Family, Culture)
Knowledge of Results (SEE Feedback, Reinforcement, Information)
Korsakov's Psychosis (SEE Alcoholism, Brain Disorder)
Latent Learning (SEE Learning)
Laterality
 7300, 7311, 7456, 7468, 7473, 7545, 7861, 7874, 7926, 8408, 8766
Latin America
 7922, 8075, 8200, 8264, 8447, 8461, 8876, 9046, 9119
Law (see also Government, Political Behavior)
 7205, 7990, 8059, 8063, 8064, 8065, 8077, 8078, 8080, 8081, 8082, 8086, 8190, 8450, 8455, 8522, 8534, 8542, 8578, 9000, 9042, 9092
Leadership (see also Management)
 7213, 7240, 8124, 8136, 8954, 9109, 9117
Learning (see also next headings, Association, Conditioning, School Learning, Rat/Learning in, Monkey/Learning in, Cat/Learning in, Childhood/Learning in)

Learning/Serial
 7381, 7759, 8521
Learning/Verbal (see also Learning/Paired Associate)
 7264, 7359, 7381, 7382, 7383, 7384, 7385, 7387, 7400, 8218, 8737
Legibility (SEE Display, Writing)
Leisure (SEE Recreation)
Lesion (see also Brain Lesion, Brain Lesion-Animal, Rat/Lesions in, Cat/Lesions in)
 7158, 7455, 7492, 7493, 7498, 7499, 7564, 7630
Liberalism (SEE Political Behavior, Personality Trait)
Licensing (SEE Law)
Light (see also Brightness, Color)
 7256, 7278, 7279, 7280, 7453, 7556, 7563, 7568, 7580, 7592, 7594, 7599, 7600, 7601, 7608, 7615, 7617, 7619, 7651, 7697, 7742, 7744, 7755, 7757, 7788, 8623
Light Adaptation (SEE Adaptation/Sensory)
Lighting (SEE Brightness, Environment)
Liking (SEE Interpersonal Attraction)
Linguistics (SEE Language, Psycholinguistics)
Listening (SEE Attention, Audition, Speech Perception)
Literature
 7438, 7970, 8052, 8177, 8178, 8181, 8182, 8184, 8185, 8186, 8187, 8467, 8473, 8474, 8477, 8634
Lobotomy (SEE Brain Lesion, Brain Lesion-Animal)
Localization
 7300, 7451, 7669
Logic (see also Thinking)
 8213
Loneliness (SEE Isolation, Alienation)
Longitudinal Study (SEE Experimental Design)
Loudness (SEE Audition, Noise, Sound)
Love (SEE Emotion)
Lower Class (SEE Socioeconomic Status)
LSD (SEE Lysergic Acid Diethylamide)
Luminance (SEE Brightness, Environment)
Lying (SEE Deception)
Lysergic Acid Diethylamide
MA Scale (SEE Anxiety)
Machine (SEE Apparatus)
Man-Machine Systems (SEE Engineering Psychology)
Management (see also Business, Leadership)
 8062, 8067, 8104, 8154, 8460, 9037, 9041, 9055, 9074, 9093, 9095, 9102, 9103, 9104, 9105, 9106, 9107, 9108, 9109, 9110, 9111, 9112, 9113, 9114, 9115, 9116, 9118, 9119, 9120
Mania (SEE Mental Disorder, Emotional Disturbance)
Manic-Depressive Psychosis (SEE Depression, Psychosis)
Manifest Anxiety (SEE Anxiety)
Marihuana
 7639, 7647, 8700
Marital Problems (see also Family Therapy)
 8281, 8292, 8592
Marketing & Marketing Research (SEE Consumer Behavior)
Marriage (see also Family, Sexual Behavior)
 7973, 8016, 8043, 8044, 8045, 8050, 8051, 8052, 8055, 8072, 8380, 8395, 8702, 8706, 8894
Masculinity (SEE Sex Role)
Masking (see also Interference)
 7295, 7296, 7312, 7315, 7323, 7498, 7589, 7831
Masochism (SEE Sexual Deviation)
Mass Behavior (SEE Group, Social Behavior-Human)
Mass Media (SEE Communication/Mass)
Maternal Behavior (see also Mother, Parent-Child Relations, Child Rearing)
 7733
Mathematics (see also Number)
 7178, 7216, 7222, 7369, 7430, 7449, 7560, 7908, 8975, 9011, 9012, 9031
Mating Behavior (SEE Sexual Behavior-Animal)
Maturation (see also Development)
 7745
Maudsley Personality Inventory (SEE Test/Personality)
Maze (SEE Learning/Maze, Rat/Maze Learning in, Apparatus-Animal)
Meaning (see also Semantics)

BRIEF SUBJECT INDEX

- 7212, 7231, 7235, 7426, 7866, 7900, 7991, 8144, 8168, 8169, 8173, 8179, 8293, 8467, 8482, 8575, 8620, 8945, 9015
- Meaningfulness**
7289, 7351, 7359, 7360, 7392, 7407, 7876, 8167, 8912
- Measurement** (see also Educational Measurement, Scaling, Statistics)
7222, 7233, 7235, 7260, 7279, 7290, 7355, 7549, 8588, 8945, 9097
- Mediating Response** (SEE Mediation)
- Mediation**
7359, 7404, 7409, 7762, 7769, 7777, 7889
- Medicine** (see also Nursing, Physician, Surgery)
7457, 8018, 8265, 8287, 8297, 8299, 8522, 8669, 8711, 8716, 8744, 8753, 8835, 8837, 8838, 8845, 8848, 8853, 9121
- Memory** (see also Recall, Recognition, Retention)
7274, 7288, 7382, 7400, 7401, 7402, 7403, 7404, 7406, 7407, 7409, 7410, 7411, 7412, 7414, 7415, 7416, 7539, 7611, 7884, 7886, 7893, 7906, 8172, 8469, 8773, 8776
- Memory/Short Term**
7401, 7417, 7418, 7888, 8640
- Meningitis** (SEE Nervous System/Disorder of)
- Menstruation** (SEE Biological Rhythms)
- Mental Deficiency** (SEE Mental Retardation)
- Mental Development** (SEE Development)
- Mental Disorder** (see also Neurosis, Psychosis, specific disorders)
7420, 7625, 7936, 8010, 8287, 8290, 8291, 8311, 8392, 8404, 8419, 8434, 8438, 8450, 8489, 8490, 8499, 8503, 8504, 8564, 8566, 8572, 8574, 8575, 8577, 8578, 8581, 8582, 8585, 8586, 8592, 8665, 8687, 8749, 8756, 8800, 8857, 8871
- Mental Health** (see also Adjustment/Personal & Social, Community Services)
7858, 7865, 8052, 8272, 8281, 8289, 8290, 8406, 8448, 8460, 8668, 8670, 8671, 8672, 8673, 8674, 8676, 8677, 8680, 8681, 8683, 8684, 8687, 8856, 8857, 8858, 8861, 8863, 8864, 8865, 8866, 8867, 8868, 8901
- Mental Hospital & Hospitalization** (see also Hospital & Hospitalization, Institution & Institutionalization)
8025, 8298, 8378, 8386, 8450, 8453, 8454, 8455, 8456, 8457, 8458, 8462, 8464, 8573, 8586, 8645, 8649, 8870
- Mental Hospital/Programs in**
8373, 8447, 8448, 8451, 8452, 8459, 8460, 8463, 8464
- Mental Hygiene** (SEE Mental Health)
- Mental Patient** (SEE Psychiatric Patient)
- Mental Processes**
7176, 7177, 7208, 7209, 7274, 7362, 7420, 7591, 7634, 7696, 7844, 7914, 8199, 8469, 8472, 8664, 8759
- Mental Retardation** (see also next headings, Learning, Learning Disorders)
8271, 8284, 8315, 8419, 8445, 8490, 8797, 8798, 8799, 8800, 8801, 8803, 8804, 8805, 8806, 8807, 8808, 8809, 8810, 8813, 8814, 8815, 8816, 8817, 8818, 8819, 8821, 8822, 8824, 8828, 8834, 8848, 8930, 8939
- Mental Retardation/Diagnosis of**
8810, 8812, 8825
- Mental Retardation/Education in** (SEE Education/Special-Mental Retardation)
- Mental Retardation/Learning in**
7895, 8802, 8810, 8826, 8827, 8829, 8830, 8831, 8942
- Mental Retardation/Treatment of**
8684, 8811, 8812, 8820, 8823, 8825, 8833
- Mental Retardation/Vocational Rehabilitation & Training in**
8283, 8812, 8831, 8832, 8834
- Meprobamate** (SEE Tranquilizer)
- Metabolism**
7464, 7469, 7607, 7610, 7618, 7624, 7627, 7631, 7636, 7647, 7654, 7657, 7660, 7664, 7668, 7671, 7672, 7677, 7680, 7693, 7714, 8412, 8527, 8748, 8778, 8817
- Method & Methodology** (see also Research Methods, Teaching Methods, Experimentation, Measurement, Survey, Experimental Design)
7181, 7208, 7214, 7243, 7250, 7290, 7374, 7449, 7690, 7705, 9135
- Metropolitan Area** (SEE Urban & Suburban Environment)
- Middle Age** (SEE Adulthood)
- Migration** (SEE Social Processes)
- Millieu Therapy** (SEE Mental Hospital/Programs in, Psychotherapy/Methods in)
- Military** (see also Personnel/Military)
8673, 8897, 9113, 9121
- Mind** (SEE Cognition, Thinking)
- Minnesota Multiphasic Personality Inventory (MMPI)**
8251, 8873, 8903
- Minority Group** (SEE Ethnology)
- MMPI** (SEE Minnesota Multiphasic Personality Inventory)
- Mobility** (SEE Movement, Social Mobility, Socioeconomic Status)
- Model** (see also Imitation)
7214, 7215, 7226, 7228, 7236, 7245, 7275, 7328, 7355, 7368, 7388, 7411, 7420, 7430, 7442, 7452, 7517, 7603, 7691, 7822, 7859, 7880, 7904, 7908, 7967, 8032, 8112, 8131, 8132, 8168, 8229, 8246, 8736, 8843, 8912, 9029, 9086, 9109
- Money**
7399, 7878, 8478, 8648, 8877, 9090, 9093, 9096
- Mongolism** (SEE Mental Retardation)
- Monitoring** (SEE Detection, Attention)
- Monkey**
7459, 7503, 7506, 7531, 7533, 7539, 7598, 7775, 7788, 7790, 7819, 7821, 7825
- Monkey/Learning in**
7503, 7755, 7789, 7790
- Mood** (SEE Emotion)
- Morale** (SEE Job Satisfaction, Attitude, Emotion)
- Morality** (SEE Value & Values, Religion, Ethics)
- Mother** (see also Maternal Behavior, Mother-Child Relations, Parent)
7947, 7960, 7962, 7964, 7965, 7969, 8044, 8047, 8049, 8050, 8071, 8072, 8212, 8273, 8314, 8316, 8466, 8485, 8622, 8624, 8706, 8959
- Mother-Child Relations** (SEE Parent-Child Relations, Child Rearing)
- Motion** (SEE Movement)
- Motion Pictures** (SEE Film)
- Motivation** (see also next headings, Achievement Motivation, Incentive, Reinforcement)
7331, 7338, 7343, 7379, 7399, 7404, 7420, 7437, 7887, 8010, 8062, 8157, 8160, 8233, 8237, 8351, 8354, 8459, 8801, 8872, 9035, 9076, 9086, 9093, 9099, 9104, 9105
- Motivation-Animal** (see also Rat/Motivation in)
7523, 7751, 7773
- Motivation/Learning** (SEE Learning, Motivation)
- Motivation Theory**
7338, 7342, 7435, 8003, 8220, 9114
- Motor Disorder**
8738, 8745
- Motor Learning** (SEE Learning/Motor)
- Motor Performance**
7297, 7352, 7461, 7573, 7650, 7862, 7890, 7920, 8771, 8828, 9065
- Motor Processes** (see also Learning/Motor, Muscle)
7327, 7356, 7445, 7461, 7472, 7492, 7521, 7542, 7543, 7547, 7548, 7564, 7584, 7676, 7683, 7837, 7849, 7915, 8257, 8937, 8974, 9134
- Motor Skill** (SEE Motor Performance)
- Mouse**
7607, 7649, 7657, 7663, 7664, 7667, 7669, 7670, 7674, 7677, 7680, 7683, 7685, 7688, 7690, 7691, 7692, 7718, 7734, 7749
- Mouth** (SEE Body)
- Movement** (see also Social Movements)
7260, 7267, 7274, 7275, 7287, 7347, 7472, 7594, 7849, 8307, 8491, 9007, 9071, 9077
- Movement/Apparent** (SEE Gestalt Psychology, Visual Perception)
- Muller-Lyer Illusion** (SEE Illusion)
- Multiple Sclerosis** (SEE Disease, Nervous System/Disorder of)
- Murder** (SEE Crime & Criminals)
- Muscle** (see also Electromyography)
7352, 7443, 7445, 7482, 7499, 7547, 7548, 7559, 7564, 7566, 7567, 7572, 7574, 7579, 7597, 7616, 7679, 7710, 7721, 8607, 8609, 8610, 8738, 8747, 8750
- Muscle Sense** (SEE Kinesthesia, Somesthesia)
- Music**
7314, 7572, 7585, 7905, 7921, 7928, 8179, 8183, 8189, 8307, 8801, 8811, 8816, 8824, 8830, 8929, 8972, 8994
- Mutism** (SEE Speech/Defective)
- Myth & Mythology** (SEE Culture)
- Narcissism** (SEE Psychoanalytic Theory, Neurosis, Personality Trait)
- Narcosis** (SEE Sleep, Drug Therapy)
- Narcotics** (SEE Drugs, Drug Addiction)
- Natural Observation** (SEE Observation)
- Navy** (SEE Military, Personnel/Military)
- Need** (see also Motivation)
7853, 8036, 8900
- Need Achievement** (SEE Achievement Motivation)
- Negro**
7199, 7871, 7890, 7905, 7933, 7934, 7945, 7953, 7961, 7973, 7979, 8008, 8009, 8010, 8012, 8014, 8044, 8049, 8060, 8065, 8066, 8072, 8255, 8380, 8479, 8605, 8859, 8866, 8898, 8953, 8989, 9059
- Neonate** (see also Infancy)
7852, 7853
- Nerve** (SEE Neurology, Neuroanatomy)
- Nervous System** (see also next headings)
7449, 7461, 7470, 7576
- Nervous System/Autonomic**
7482, 7706, 7724, 8519, 8589
- Nervous System/Central**
7252, 7472, 7486, 7548, 7567, 7574, 7580, 7613, 7655, 7657, 7675, 7684, 7692, 7711, 8736
- Nervous System/Disorder of**
7165, 7329, 8268, 8651, 8730, 8731, 8733, 8735, 8736, 8739, 8743, 8744, 8747, 8749, 8753, 8754, 8755, 8761, 8784, 8790, 8846, 8926
- Neuroanatomy**
7487, 7488, 7489
- Neuroanatomy-Animal**
7474, 7490
- Neurology**
7191, 7305, 7437, 7442, 7461, 7462, 7463, 7465, 7468, 7472, 7473, 7475, 7478, 7480, 7481, 7548, 7560, 7579, 8262, 8667, 8736, 8789
- Neurology-Animal**
7158, 7462, 7467, 7474, 7476, 7477, 7479, 7482, 7483, 7484, 7485, 7486, 7499, 7504, 7522, 7524, 7529, 7534, 7545, 7546, 7553, 7557, 7559, 7562, 7564, 7565, 7571, 7578, 7580, 7581, 7582, 7583, 7630, 7632, 7661, 7664, 7666, 7698, 7700, 7704, 7724
- Neuron** (SEE Neurology, Neuroanatomy)
- Neurophysiology** (SEE Neurology, Neuroanatomy)
- Neurosis & Neuroticism** (see also specific neuroses)
8052, 8138, 8185, 8199, 8208, 8218, 8249, 8250, 8252, 8267, 8351, 8372, 8405, 8413, 8417, 8421, 8424, 8428, 8429, 8431, 8433, 8452, 8488, 8494, 8495, 8498, 8509, 8512, 8513, 8519, 8540, 8563, 8573, 8574, 8579, 8593, 8600, 8604, 8610, 8660, 8918
- News & Newspaper** (SEE Communication/Mass)

- Oxygen** (SEE Respiration, Biochemistry)
- Pain** (see also Somesthesia)
- 7322, 7507, 7553, 7609, 8660
- Paired Associate Learning** (SEE Learning/ Paired Associate)
- Palsy** (SEE Nervous System/Disorder of, Physical Handicap)
- Paralysis** (SEE Nervous System/Disorder of, Physical Handicap)
- Paranoia** (see also Psychosis, Neurosis, Schizophrenia, Personality Trait)
- 8496, 8500, 8630
- Parapsychology**
- Parent** (SEE Father, Mother, Parent-Child Relations)
- Parent-Child Relations** (see also Family Relations)
- 7733, 7850, 7858, 7861, 7868, 7952, 7954, 7956, 7957, 7958, 7959, 7960, 7961, 7962, 7965, 7966, 7967, 7968, 7969, 8014, 8047, 8050, 8232, 8292, 8316, 8339, 8352, 8501, 8516, 8563, 8592, 8622, 8701, 8809, 8904, 8988, 8989
- Parkinson's Disease** (SEE Nervous System/Disorder of)
- Pastoral Counseling** (SEE Counseling)
- Paternal Deprivation** (SEE Father, Parent-Child Relations)
- Pathogenesis** (SEE Etiology)
- Patient** (see also Psychiatric Patient)
- 8255, 8322, 8735, 8841, 8844, 8845, 8853
- Pattern**
- 7226, 7272, 7308, 7508, 7511, 7918
- Peace** (SEE International Relations, War)
- Peace Corps** (SEE Government, International Relations)
- Peak Experience** (SEE Emotion)
- Peer Rating** (SEE Peers)
- Peers**
- 8101, 8135, 9089
- Penitentiary** (SEE Prison)
- Perception** (see also next headings, Intersensory Processes, Childhood/Perception in)
- 7161, 7186, 7265, 7268, 7373, 7393, 8562, 8828, 8935, 9024, 9136
- Perception/Auditory** (SEE Auditory Perception)
- Perception/Depth**
- 7270, 7298, 7299, 7843
- Perception/Form & Shape**
- 7307, 7308, 7512, 7788, 7834, 8945
- Perception/Size**
- 7270, 7298, 7299, 7414, 7788
- Perception/Social** (SEE Social Perception)
- Perception/Space**
- 7265, 7286, 7294, 7299, 7300, 7927, 8766
- Perception/Time**
- 7275, 7945
- Perception/Visual** (SEE Visual Perception)
- Perception/Weight** (SEE Weight, Perception)
- Perceptual Defense** (SEE Defense Mechanism)
- Perceptual Isolation** (SEE Isolation, Deprivation/Sensory)
- Performance** (see also Job Performance, Motor Performance)
- 7330, 7342, 7397, 8442, 9061, 9063, 9136
- Persistence** (SEE Personality Trait, Thinking)
- Personality** (see also next headings, Childhood/Personality in, Teacher Attitudes & Personality, the various personality traits)
- 7226, 7366, 7420, 8007, 8201, 8204, 8206, 8236, 8239, 8274, 8404, 8475, 8486, 8563, 8569, 8591, 8708, 8715, 8852, 9118
- Personality Change**
- 8021, 8031, 8102, 8324, 8370, 8906
- Personality Correlates**
- 7249, 7596, 7944, 8036, 8106, 8210, 8216, 8219, 8222, 8249, 8252, 8256, 9137
- Personality Diagnosis** (SEE Personality Measurement, Test/Personality)
- Personality Disorder** (SEE Emotional Disturbance, Neurosis)
- Personality Inventory** (SEE Personality Measurement)
- Personality Measurement**
- 8233, 8241, 8247, 8253, 8254, 8295, 8495, 8709, 9041
- Personality Test** (SEE Test/Personality)
- Personality Theory**
- 7179, 8019, 8196, 8215, 8359, 8965
- Personality Trait** (see also Inventory)
- 8147, 8156, 8194, 8202, 8203, 8207, 8211, 8213, 8214, 8222, 8226, 8227, 8247, 8254, 8260, 8344, 8535, 8570, 8608, 8622, 8883, 8910, 8965, 8968, 8972, 8997, 9120
- Personality/Assessment of** (SEE Personality Measurement)
- Personality/Childhood** (SEE Childhood/Personality in)
- Personnel** (see also next headings)
- 7220, 8114, 8250, 8669, 8959, 9039, 9040, 9055, 9118
- Personnel/Industrial**
- 7318, 7447, 8143, 8154, 8193, 8677, 9038, 9043, 9044, 9076, 9082, 9083, 9099, 9100, 9103, 9109, 9111, 9112, 9116
- Personnel/Military**
- 8108, 8140, 8256, 8373, 8572, 8581, 8582, 8671, 9051, 9052, 9056, 9057, 9059, 9060, 9063, 9065, 9067, 9068, 9069, 9080, 9081, 9087, 9091, 9094, 9098, 9113, 9123
- Personnel/Psychological** (see also Counselor, Nurse, Psychiatrist, Psychologist, Therapist)
- 8012, 8343, 8393, 8406, 8448, 8452, 8454, 8522, 8608, 8671, 8688, 8806, 9086
- Persuasion** (see also Interpersonal Influence, Social Influence)
- 8140, 8142
- Phenomenology**
- 7164, 7180, 8321
- Phenylketonuria** (SEE Genetics, Mental Disorder, Mental Retardation)
- Philosophy** (see also Existentialism)
- 7162, 7169, 7170, 7171, 7172, 7173, 7174, 7175, 7176, 7177, 7188, 7193, 7214, 8020, 8021, 8022, 8570, 8695
- Phobia** (see also Anxiety, Fear)
- 7859, 8396, 8405, 8594, 8599, 8601, 8602
- Phoneme** (SEE Word, Language)
- Phonetics** (SEE Speech, Verbal Behavior, Language)
- Photic** (SEE Light)
- Photograph** (SEE Picture)
- Physical Education** (SEE Education/Physical)
- Physical Handicap** (see also Blindness, Childhood/Handicapped, Deafness & Hearing Disorder, Motor Disorder)
- 8678, 8704, 8705, 8706, 8708, 8709, 8730
- Physical Therapy** (SEE Occupational & Physical Therapy)
- Physician**
- 8277, 8278, 8298, 8461, 8522, 8674, 8700, 8825, 8851
- Physiological Correlates** (see also Stress/Physiological)
- 7425, 7447, 7460, 7550, 7596, 7698, 7711, 7983, 8588, 8722, 8724, 9084
- Physiological Psychology**
- 7454, 7455
- Physiology** (see also Electrophysiology)
- 7165, 7328, 7436, 7438, 7444, 7448, 7450, 7454, 7455, 7461, 7465, 7473, 7735, 8262
- Physiology/Sensory** (see also Vision/Physiology of)
- 7321, 7592, 7595, 7597, 7598, 7599, 7603, 7604
- Physique** (see also Body)
- 7454, 8011, 8016, 8271, 8653, 8658, 8662, 8838, 8849
- Piaget/J.** (SEE Childhood/Concepts & Problem Solving in, Childhood/Development in)
- Picture**
- 7372, 7382, 7391, 7424, 7426, 7903, 8142, 8180, 8617, 8830
- Picture-Frustration** (SEE Projective Technique)
- Pigeon**
- 7697, 7751, 7759, 7766, 7780, 7786, 7787, 7806
- Pilot** (SEE Aviation, Personnel/Military)
- Pitch** (SEE Sound, Audition)
- Pinutary** (SEE Gland, Hormone)
- PK** (SEE Parapsychology)
- Placebo** (SEE Drug Effects)
- Play** (SEE Childhood/Social Behavior in, Game, Recreation)
- Play Therapy** (SEE Psychotherapy/Children)
- Pleasure** (SEE Emotion)
- Poisson Distribution** (SEE Statistics)
- Police** (SEE Crime & Criminals, Law)
- Political Behavior**
- 7869, 7871, 7880, 7986, 8005, 8008, 8011.

BRIEF SUBJECT INDEX

8058, 8060, 8061, 8065, 8066, 8155, 8875, 8899, 9025
Politics (SEE Political Behavior, Government)
Pollution (SEE Environment)
Popularity (SEE Interpersonal Attraction, Social Approval)
Population Characteristics
 7234, 7749, 7993, 8005, 8071, 8191, 8366, 8527, 8531, 8537, 8567, 8685
Population Control (SEE Birth Control)
Porteus Maze (SEE Learning/Maze, Apparatus)
Potential/Evoked (see also Electrical Activity)
 7305, 7496, 7506, 7536, 7557, 7573, 7576, 7589, 7590, 7600, 7601, 7602, 8630, 8710
Poverty (SEE Socioeconomic Status, Childhood/Disadvantaged)
Power (SEE Dominance, Social Influence)
Practice
 7269, 7282, 7319, 7761
Precognition (SEE Parapsychology)
Prediction (see also Achievement/Prediction of Academic)
 7229, 7324, 7916, 8098, 8113, 8488, 8497, 8555, 8645, 8775, 9052, 9054, 9056, 9080, 9087, 9092, 9112
Preference
 7308, 7344, 7473, 7725, 7746, 7753, 7778, 7834, 8251, 8824, 9107, 9117, 9125
Pregnancy
 7632, 7641, 8044, 8054, 8055, 8071, 8072, 8282, 8848, 8860
Prejudice
 7201, 8013, 8096, 8098, 8134, 8188
Prenatal (SEE Pregnancy)
Preschool Children (SEE Childhood/Preschool)
Presentation Rate (SEE Interval/Interstimulus)
Prestige (SEE Socioeconomic Status)
Prison (see also Crime & Criminals)
 8539, 8541, 8546, 8549
Prison Inmate (SEE Prison)
Probability (see also Learning/Probability, Statistics)
 7216, 7218, 7219, 7228, 7236, 7250, 7402, 7452, 7573, 7790, 8235, 9029
Probability Learning (SEE Learning/Probability)
Problem Solving (see also Choice Behavior, Decision Making, Childhood/Concepts & Problem Solving in)
 7226, 7362, 7368, 7425, 7427, 7428, 7429, 7430, 7432, 8109, 8113, 8124, 9037
Profile (SEE Score & Scoring)
Programed Instruction (see also Teaching Aids)
 8922, 8936, 9011, 9016, 9019, 9021, 9031, 9032, 9060, 9061
Programming (SEE Computer)
Projection (SEE Defense Mechanism, Cerebral Cortex, Visual Cortex)
Projective Technique (see also Rorschach Test)
 7939, 7963, 8148, 8236, 8253, 8254, 8255, 8256, 8257, 8258, 8372, 8376, 8495, 8558, 8714, 8822
Propaganda (SEE Communication, Communication/Mass, Persuasion)
Proprioception (SEE Kinesthesia, Somesthesia)
Prostitution (SEE Occupation, Sexual Behavior)
Protestantism (SEE Religion)
Psychedellic Experience (SEE Drug Effects-Human)
Psychiatric Diagnosis (SEE Psychodiagnosis)
Psychiatric Hospital (SEE Mental Hospital & Hospitalization)
Psychiatric Patient (see also Patient)
 8082, 8212, 8268, 8343, 8349, 8365, 8366, 8376, 8408, 8412, 8447, 8448, 8453, 8497, 8498, 8504, 8507, 8535, 8565, 8567, 8575, 8576, 8578, 8580, 8583, 8584, 8586, 8588, 8592, 8605, 8640, 8677, 8679, 8775, 8855, 8870
Psychiatric Patient Treatment (see also Case Report-Treatment, Treatment/Outpatient)
 8298, 8300, 8351, 8357, 8373, 8386, 8397, 8459, 8502, 8532, 8570, 8684

Psychiatric Ward (SEE Mental Hospital & Hospitalization)
Psychiatrist
 8277, 8297, 8301, 8302, 8356, 8450, 8532, 8542, 8615
Psychiatry (see also Psychotherapy, Child Psychiatry)
 7160, 7165, 7166, 7168, 8077, 8080, 8081, 8082, 8162, 8261, 8262, 8270, 8279, 8285, 8288, 8290, 8294, 8335, 8492, 8681, 8859
Psychiatry Abroad
 8264, 8405
Psychoanalysis (see also next headings)
 8007, 8306, 8309, 8314, 8316, 8319, 8326, 8327, 8331, 8333, 8336, 8337, 8338, 8339, 8340, 8341, 8352, 8355, 8356, 8357, 8361, 8404, 8468, 8482, 8570, 8571, 8595, 8601, 8614, 8667, 8690, 8840
Psychoanalyst (SEE Psychiatrist)
Psychoanalytic Interpretation
 7970, 8177, 8195, 8316, 8334, 8367, 8466, 8467, 8471, 8473, 8474, 8475, 8476, 8477, 8478, 8479, 8482, 8484, 8485, 8602
Psychoanalytic Theory
 7172, 7844, 7852, 7853, 7875, 7970, 8063, 8196, 8221, 8240, 8333, 8336, 8374, 8465, 8467, 8468, 8469, 8470, 8472, 8476, 8480, 8481, 8483, 8486, 8500, 8574, 8590, 8604, 8614, 8625, 8840, 8925
Psychoanalytic Therapy (SEE Psychoanalysis)
Psychodiagnostics (see also Clinical Judgment, Diagnosis, Diagnosis/Differential, Mental Retardation/Diagnosis of, Schizophrenia/Diagnosis of)
 7203, 7865, 8269, 8293, 8311, 8366, 8487, 8489, 8490, 8492, 8494, 8495, 8497, 8499, 8500, 8501, 8503, 8504, 8505, 8506, 8507, 8508, 8510, 8511, 8512, 8513, 8554, 8567, 8571, 8605, 8647, 8855
Psychodrama (SEE Psychotherapy/Group, Psychotherapy/Methods in)
Psychokinesis (PK) (SEE Parapsychology)
Psycholinguistics
 7907, 7913, 8170, 8174, 8175, 8176, 8742, 9010
Psychologist
 7196, 7198, 7201, 7202, 7205, 7206, 7992, 8278, 8299, 8300, 8730
Psychology
 7159, 7174, 7175, 7179, 7180, 7181, 7183, 7184, 7191, 7199, 7201, 7203, 7208, 7210, 7247, 7985, 8159, 8908, 9042
Psychology Annual
 7162, 7165, 7181, 7184, 7200, 7204, 7205, 7206, 7480, 8019, 8299, 8384, 8881, 8889
Psychology/History of
 7161, 7162, 7163, 7164, 7166, 7167, 7168, 7190, 7192, 8264, 8279, 8285, 8294, 8387, 8590
Psychometrics (SEE Test & Testing, Statistics)
Psychomotor Performance (SEE Motor Performance)
Psychoneurosis (SEE Neurosis)
Psychopathology
 7954, 8195, 8251, 8265, 8267, 8280, 8298, 8351, 8379, 8404, 8430, 8466, 8492, 8493, 8505, 8570, 8575, 8576, 8579, 8761, 8905
Psychopathy (SEE Mental Disorder)
Psychopharmacology (SEE Drug Effects, Drug Therapy, Biochemistry)
Psychophysics
 7178, 7261, 7263
Psychophysiology (SEE Physiological Psychology)
Psychosis & Psychotics (see also Mental Disorder, specific psychoses)
 8199, 8346, 8398, 8416, 8426, 8435, 8436, 8443, 8446, 8458, 8495, 8497, 8562, 8563, 8567, 8573, 8579, 8593, 8606, 8607, 8608, 8609, 8610, 8611, 8612, 8613, 8614, 8615, 8616, 8617
Psychosis/Children (SEE Childhood/Psychosis in)
Psychosomatic Disorder
 8277, 8433, 8659, 8660, 8661, 8662, 8663
Psychosomatic Medicine (SEE Psychosomatic Disorder, Medicine)

Psychotherapist (SEE Therapist)
Psychotherapy (see also next headings, Behavior Therapy, Drug Therapy, Family Therapy, Psychiatry, Psychoanalysis, Therapy, Treatment)
 7189, 8266, 8269, 8280, 8295, 8296, 8320, 8321, 8325, 8329, 8332, 8345, 8347, 8349, 8354, 8358, 8365, 8407, 8488, 8508, 8554, 8616, 8721, 8727
Psychotherapy/Children
 8314, 8315, 8317, 8319, 8321, 8323, 8331, 8337, 8343, 8355, 8371, 8374, 8501, 8594, 8852, 8946
Psychotherapy/Client Centered (SEE Psychotherapy/Methods in)
Psychotherapy/Group (see also Family Therapy)
 8325, 8367, 8369, 8370, 8371, 8372, 8374, 8375, 8376, 8377, 8379, 8381, 8382, 8384, 8386, 8397, 8452, 8459, 8872
Psychotherapy/Methods in
 8304, 8305, 8307, 8310, 8311, 8312, 8315, 8318, 8322, 8323, 8324, 8328, 8333, 8340, 8342, 8343, 8346, 8348, 8349, 8353, 8373, 8374, 8375, 8382, 8383, 8384, 8385, 8386, 8397, 8402, 8403, 8404, 8405, 8406, 8407, 8409, 8410, 8517, 8518, 8541, 8546, 8548, 8549, 8568, 8571, 8591, 8649
Psychotherapy/Research in
 8313, 8330, 8335, 8344, 8347, 8349, 8350, 8361, 8363, 8364
Psychotherapy/Short Term
 8308, 8353, 8852
Puberty (SEE Adolescence)
Public Opinion (SEE Opinion)
Pulse (SEE Cardiovascular Processes, Heart Rate)
Punishment
 7159, 7374, 7782, 7783, 7931, 8519, 8528, 8584
Pupil Size (SEE Eye)
Q-Sort (SEE Test/Personality, Personality Measurement)
Questionnaire (see also Inventory, Scale, Survey)
 7200, 7249, 8236, 8365, 8507, 8990, 9060, 9070
Rabbit
 7443, 7446, 7490, 7523, 7538, 7540, 7553, 7556, 7561, 7563, 7566, 7575, 7581, 7656, 7666, 7721
Race (SEE Ethnology)
Race Relations (SEE Integration, Social Movements)
Radiation
Radio (SEE Communication/Mass)
Ranking (SEE Measurement, Scale, Scaling)
Rapid Eye Movement (see also Dream & Dreaming, Sleep)
 7324, 7326, 7331, 7551, 7586, 7715, 7852, 8258, 8565, 8760
Rat (see also next headings)
 7469, 7477, 7483, 7484, 7491, 7614, 7617, 7618, 7622, 7629, 7722, 7725, 7726, 7727, 7752, 7782, 7785, 7827, 7828
Rat/Activity in
 7252, 7505, 7616, 7691, 7693, 7740, 7801, 7812
Rat/Avoidance & Avoidance Learning in
 7504, 7516, 7526, 7527, 7605, 7608, 7615, 7662, 7686, 7687, 7748, 7764, 7771, 7784, 7792, 7794, 7795, 7797, 7807, 7808, 7810
Rat/Brain Stimulation in
 7513, 7517, 7519, 7520, 7522, 7524, 7525, 7528, 7534, 7542, 7545, 7608, 7620, 7658, 7673, 7803
Rat/Conditioning in
 7479, 7519, 7619, 7653, 7687, 7753, 7763, 7764, 7765, 7767, 7770, 7771, 7781, 7782, 7784, 7785, 7798, 7800, 7802, 7803, 7805
Rat/Deprivation in

BRIEF SUBJECT INDEX

- 7441, 7665, 7715, 7742, 7752, 7774, 7781
- Rat/Discrimination in**
7491, 7520, 7527, 7534, 7571, 7737, 7742, 7791, 7798, 7826
- Rat/Drug Effects in**
7252, 7441, 7516, 7517, 7522, 7610, 7615, 7618, 7620, 7621, 7628, 7630, 7631, 7647, 7648, 7650, 7651, 7652, 7653, 7658, 7659, 7660, 7662, 7665, 7668, 7669, 7671, 7672, 7673, 7675, 7678, 7680, 7681, 7682, 7686, 7687, 7689, 7690, 7691, 7693, 7713, 7750
- Rat/Extinction in**
7662, 7743, 7782, 7792, 7799, 7800, 7807, 7808, 7809, 7810, 7811, 7812, 7813, 7814
- Rat/Learning in**
7497, 7616, 7659, 7673, 7743, 7758, 7760, 7811
- Rat/Lesions in**
7479, 7494, 7495, 7497, 7501, 7504, 7505, 7507, 7513, 7514, 7515, 7516, 7606, 7630, 7691, 7712
- Rat/Maze Learning in**
7441, 7526, 7681, 7756, 7774
- Rat/Motivation in**
7520, 7571, 7653, 7750, 7752, 7753, 7754, 7763, 7774, 7781
- Rat/Reinforcement & Reinforcement Schedule in**
7528, 7534, 7571, 7651, 7743, 7753, 7754, 7756, 7763, 7765, 7797, 7798, 7799, 7800, 7801, 7802, 7803, 7805, 7808, 7811, 7812, 7813, 7814
- Rat/Shock & Shock Effects in**
7516, 7691, 7748, 7764, 7782, 7797, 7801, 7807, 7808
- Rat/Stress Effects in**
7706, 7707, 7709, 7712, 7713, 7714, 7715
- Rating (see also Rating Scale)**
7976, 8954, 8965, 8968, 8977, 9091, 9108
- Rating Scale**
8035, 8735
- Reaction Time**
7288, 7318, 7347, 7353, 7354, 7355, 7356, 7357, 7411, 7468, 7527, 7573, 8440, 8643, 8694
- Readability (SEE Display, Writing)**
- Reading**
7349, 7372, 7874, 7885, 7893, 7926, 8042, 8713, 8726, 8924, 8927, 8978, 8979, 8980, 8981, 8991, 8995, 9005, 9015, 9027, 9030, 9034
- Reading Deficiency (see also Education/Special-Remedial)**
7874, 8726, 8734, 8757, 8940, 8945
- Reasoning (SEE Logic, Thinking, Cognition, Categorical Behavior)**
- Recall (see also Memory, Recognition, Retention)**
7324, 7384, 7395, 7400, 7404, 7405, 7409, 7413, 7416, 7419, 7891, 7892, 7894, 8151, 8737, 8782, 8827, 8829, 8980
- Recognition (see also Memory, Recall, Retention)**
7310, 7313, 7351, 7402, 7768, 7832, 7874, 8315, 8768, 8773, 8776, 8991
- Recreation**
7456, 7952, 8203, 8238, 8707, 8923
- Redundancy (SEE Information Theory)**
- Reflex (see also Conditioned Response, Response, Muscle)**
7443, 7458, 7485, 7492, 7521, 7557, 7643, 7694, 7700, 7773
- Regression (SEE Personality, Behavior Problems, Statistics)**
- Rehabilitation (see also Counseling, Rehabilitation/Vocational, Education/Special-Remedial)**
8193, 8283, 8297, 8398, 8457, 8488, 8543, 8551, 8669, 8675, 8680, 8685, 8704, 8736, 8783, 8857
- Rehabilitation/Vocational (see also Mental Retardation/Vocational Rehabilitation & Training in)**
8678, 8685, 8686, 8705, 9049
- Reinforcement (see also next headings, Rat/Reinforcement & Reinforcement Schedule in)**
7194, 7331, 7397, 7399, 7437, 7550, 7751, 7789, 7931, 7941, 7969, 8095, 8146, 8394, 8648, 8662, 8824
- Reinforcement Schedule**
7398, 7434, 7790, 7796, 7804, 7806, 7897, 7979, 8528
- Reinforcement Theory**
7194, 8095
- Reinforcement/Delayed (SEE Reinforcement Schedule)**
- Reinforcement/Partial (SEE Reinforcement Schedule)**
- Reinforcement/Secondary (SEE Reinforcement)**
- Reinforcement/Social**
7856, 7878, 7882, 7890, 7941, 8217, 8399, 8550, 8580, 8821, 8986, 9022, 9038
- Relaxation (SEE Behavior Therapy, Muscle)**
- Reliability**
7231, 7233, 7244, 7919, 8242, 8917, 9046
- Religion**
7162, 7436, 8013, 8015, 8019, 8020, 8021, 8022, 8023, 8024, 8025, 8026, 8027, 8028, 8029, 8030, 8031, 8032, 8033, 8054, 8070, 8078, 8085, 8087, 8127, 8152, 8280, 8288, 8478, 8550, 8670, 8674, 8676, 8689, 8690, 8691, 8692, 8698, 8798, 8815, 8836, 8837, 8842, 8844, 8864, 9025, 9045
- REM (SEE Rapid Eye Movement)**
- Reminiscence (SEE Memory, Recall)**
- Remission (SEE Mental Hospital & Hospitalization, Hospital & Hospitalization)**
- Repetition (SEE Stimulation, Familiarity)**
- Replication (SEE Contribution & Criticism)**
- Repression**
8214, 8227, 8253, 8469
- Reptile (SEE Animals)**
- Research (see also Experimentation)**
7159, 7181, 7213, 7265, 7842, 7990, 7992, 8058, 8121, 8161, 8270, 8418, 8525, 8668, 8697, 8818, 8874, 8888, 9031, 9039, 9107, 9131
- Research Methods**
7209, 7211, 7302, 7335, 7570, 7825, 7988, 7994, 8672, 8958, 9130
- Reserpine (SEE Tranquilizer)**
- Residential Treatment (SEE Mental Hospital & Hospitalization, Hospital & Hospitalization, Institution & Institutionalization)**
- Respiration**
7259, 7340, 7459, 7494, 7676, 7704, 7706, 7708, 7714, 8660, 8750, 8838, 8854, 9084
- Response (see also Conditioned Response, Conditioned Emotional Response)**
7290, 7364, 7388, 7409, 7421, 7437, 7571, 7790, 7876, 8909
- Response Latency (SEE Reaction Time)**
- Response Set (SEE Set)**
- Response/Delayed (SEE Response)**
- Retardate (SEE Mental Retardation)**
- Retention (see also Memory, Recall, Recognition)**
7267, 7276, 7412, 7503, 7526, 7770, 7795, 7883, 8090, 8799
- Retina (see also Eye)**
7271, 7468, 7555, 7592, 7595, 7600, 7601, 7602, 8710
- Retirement (SEE Adulthood, Occupation, Gerontology)**
- Retrieval (SEE Information)**
- Reviews**
7264, 7321, 7896, 7964, 8313, 8344, 8391, 8533, 8708, 8887, 9088, 9131
- Reward (see also Reinforcement)**
7254, 7737, 7763, 7882, 8095, 8110, 8528, 8932, 9096
- Rigidity (SEE Personality Trait, Authoritarianism)**
- Riot (SEE Social Behavior/Human, Aggression, Social Movements)**
- Risk Taking**
8111, 8114, 8224, 8588
- Risky Shift Phenomenon (SEE Group Dynamics, Risk Taking)**
- RNA (SEE Biochemistry)**
- Role**
7951, 8026, 8034, 8043, 8047, 8099, 8109, 8116, 8217, 8296, 8297, 8310, 8356, 8373, 8402, 8693, 8706, 8961, 8963, 9003, 9099, 9109
- Role Playing (SEE Role)**
- Rorschach Test (see also Projective Technique)**
7873, 8236, 8257, 8259, 8260, 8488, 8495, 8512, 8513, 8621, 9049
- Rosenzweig Picture Frustration Study (SEE Projective Technique)**
- Rotary Pursuit (SEE Visual Perception, Motor Performance)**
- Rotation (SEE Somesthesia, Factor Analysis)**
- Running (SEE Activity, Motor Performance)**
- Rural Environment (see also Community, Urban & Suburban Environment)**
7834, 7973, 8000, 8006, 8015, 8117, 8678
- Russia (SEE USSR)**
- Sadism (SEE Sexual Deviation)**
- Safety (see also Driving)**
9137
- Salary (SEE Money, Socioeconomic Status)**
- Salivation (SEE Conditioning/Classical, Gland, Taste)**
- Salt (SEE Biochemistry, Food)**
- Satiation (SEE Motivation)**
- Scale (see also Attitude Measurement, Inventory, Rating Scale, Testing Methods)**
7240, 7243, 7275, 7967, 8156, 8242, 8243, 8249, 8252, 8432, 8555, 8873, 8895, 8904
- Scaling (see also Measurement)**
7221, 7261, 7306, 8167, 8965, 9127
- Scanning (SEE Detection)**
- Schizophrenia (see also next headings)**
8250, 8271, 8351, 8464, 8509, 8512, 8618, 8621, 8623, 8624, 8626, 8627, 8629, 8630, 8631, 8633, 8638, 8639, 8641, 8643, 8644, 8645, 8647
- Schizophrenia/Childhood**
8494, 8622, 8625, 8637, 8642, 8646, 8652, 8655
- Schizophrenia/Chronic**
8268, 8445, 8580, 8610, 8627, 8632, 8640, 8648, 8650, 8651, 8653, 8654, 8656
- Schizophrenia/Diagnosis of**
8511, 8513, 8642, 8653
- Schizophrenia/Family Role in**
8622, 8624, 8641
- Schizophrenia/Learning & Cognition in**
8623, 8625, 8631, 8636, 8640, 8652
- Schizophrenia/Physiology of**
7517, 8268, 8490, 8619, 8623, 8627, 8628, 8629, 8653, 8658
- Schizophrenia/Symptomatology of**
7517, 8496, 8562, 8587, 8618, 8620, 8621, 8628, 8632, 8635, 8636, 8638
- Schizophrenia/Treatment of (see also Drug Therapy-Schizophrenia)**
8398, 8464, 8570, 8620, 8633, 8634, 8647, 8648, 8649, 8652, 8655
- Scholastic Achievement (SEE Achievement/Academic)**
- School (see also next headings, Achievement, Classroom, College, Education)**
8230, 8946, 9008
- School Achievement (SEE Achievement/Academic)**
- School Adjustment**
8286, 8553, 8594, 8645, 8896, 8905, 8909, 8978, 9022
- School Administration**
8900, 8901, 8961, 8962, 8963, 8987
- School Anxiety (SEE Anxiety, Test Anxiety)**
- School Dropout**
8879, 8892
- School Learning (see also Achievement/Academic)**
7292, 7953, 8440, 8922, 8982, 8983, 8986, 8992, 8996, 8999, 9009, 9019, 9028, 9033, 9036
- School Psychology (SEE Educational Psychology, Guidance/Educational)**
- School Subjects (SEE Curriculum, Mathematics, Reading)**
- Science & Scientists**

- 7167, 7170, 7187, 7190, 7197, 7214, 7248, 7448, 8028, 9017
- Scientific Method** (SEE Method & Methodology)
- Score & Scoring**
7231, 7241, 8231, 8259, 8504, 8555, 8663, 8822, 8912, 8913, 9057
- Seasonal Changes** (SEE Time, Temperature, Environment)
- Security** (SEE Dependency)
- Sedative** (SEE Drugs)
- Segregation** (SEE Integration)
- Seizure** (SEE Electroconvulsive Shock, Nervous System/Disorder of, Epilepsy)
- Selection**
7201, 7392, 7930, 8692, 8820, 9049, 9050, 9053, 9054, 9055, 9056, 9118
- Self** (see also next headings)
7159, 7845, 7931, 8004, 8709, 8930, 8967
- Self-Actualization** (SEE Self)
- Self Concept**
7249, 7858, 7941, 8204, 8217, 8220, 8370, 8376, 8383, 8482, 8486, 8535, 8558, 8822, 8954, 8964, 8966, 8972, 9079, 9089, 9127
- Self-Disclosure** (SEE Interpersonal Processes)
- Self-Esteem** (SEE Self-Concept)
- Self-Evaluation**
7174, 7933, 8048, 8510, 8722, 8910, 9092
- Self-Perception**
7196, 7867, 7961, 8011, 8038, 8092, 8152, 8345, 8356, 8891, 8967, 9079
- Self/Ideal** (SEE Self Concept)
- Self-Stimulation** (SEE Motivation, Stimulation, Brain Stimulation, Rat/Brain Stimulation in)
- Selling** (SEE Advertising, Business, Consumer Behavior)
- Semantic Differential**
7245, 7900, 8156, 8168, 8173, 8240, 8626, 9097, 9116
- Semantics** (see also Meaning, Meaningfulness)
7377, 7390, 7411, 7900, 7902, 7910, 8164, 8169, 8170
- Senility** (SEE Geriatrics)
- Sensitivity**
7287, 7316, 7507, 7599, 7607, 7642, 7750, 8103, 8107, 8119, 8214, 8227, 8253, 8375, 8377, 8948, 8962, 8966
- Sensory Adaptation** (SEE Adaptation/Sensory)
- Sensory Deprivation** (SEE Deprivation/Sensory)
- Sensory Physiology** (SEE Physiology/Sensory)
- Sensory Processes** (see also Intersensory Processes, Physiology/Sensory)
7261, 7321, 7449, 7596, 7823, 7929, 9077
- Sentence**
7319, 7415, 7888, 7891, 7902, 8175
- Sentence Completion Test** (SEE Projective Technique)
- Serial Learning** (SEE Learning/Serial)
- Set** (see also Expectation)
7340, 7349, 7418, 7701, 7872, 8040, 8083, 8089, 8244, 8293, 9128
- Sex**
7201, 7757, 8074, 8184, 8240, 8274, 8631
- Sex Differences**
7300, 7918, 7926, 7927, 7934, 7940, 7946, 7956, 7965, 7976, 7978, 8036, 8038, 8048, 8073, 8083, 8106, 8117, 8137, 8138, 8198, 8212, 8216, 8360, 8531, 8553, 8575, 8593, 8660, 8663, 8704, 8820, 8899, 8903, 8956, 8968, 8977, 9005
- Sex Differences—Animal**
7628, 7698, 7703
- Sex Differences/Academic Achievement**
8993
- Sex Role**
7927, 8052, 8075, 8137, 8152, 8178, 8198, 8201, 8240, 8558, 8560, 8561
- Sexual Behavior**
7682, 7736, 7973, 8070, 8073, 8099, 8198, 8280, 8309, 8476, 8544, 8752, 8777
- Sexual Behavior—Animal**
7629, 7716, 7736, 7744, 7815, 7816, 7818, 7819
- Sexual Deviation** (see also Homosexuality)
8470, 8556, 8557, 8560, 8591, 8600
- Sexual Disorder**
8079, 8407, 8545
- Shape Perception** (SEE Perception/Form & Shape)
- Shaping** (SEE Conditioning)
- Sheltered Employment** (SEE Rehabilitation/Vocational)
- Shock & Shock Intensity** (see also Electroconvulsive Shock, Brain Stimulation, Rat/Brain Stimulation in, Rat/Shock & Shock Effects in)
7253, 7364, 7563, 7697, 7796, 8646, 9065, 9081
- Shock Therapy** (SEE Electroconvulsive Shock Therapy)
- Shock/Electroconvulsive** (SEE Electroconvulsive Shock)
- Sibling** (SEE Family Relations)
- Signal**
7313, 7318, 7348, 7363, 7380, 7398, 7573, 7750, 7783, 7796, 7797, 9122
- Similarity**
7306, 7346, 7403, 7423, 8148, 8201, 9091
- Simulation** (see also Model)
7226, 9018, 9065
- Size Constancy** (SEE Gestalt Psychology, Visual Perception, Perception)
- Size Perception** (SEE Perception/Size)
- Skin** (see also Cutaneous Sense)
7259, 7340, 7579, 8412, 8520
- Skin Resistance** (SEE Skin, Galvanic Skin Response)
- Sleep** (see also Dream & Dreaming, Rapid Eye Movement)
7324, 7326, 7327, 7328, 7329, 7330, 7331, 7551, 7558, 7586, 7635, 7637, 7685, 7695, 7705, 7715, 7852, 8207, 8258, 8413, 8437, 8565, 8596, 8760
- Slow Learners** (SEE Learning Disorders, Mental Retardation)
- Smell**
7321, 7753, 7823
- Smoking**
7636, 8838
- Social Processes** (see also next headings, Interpersonal Processes)
7181, 7736, 7948, 7959, 7986, 7987, 7993, 7995, 7996, 7998, 8000, 8001, 8002, 8003, 8006, 8010, 8013, 8033, 8052, 8058, 8059, 8062, 8063, 8068, 8069, 8157, 8200, 8210, 8290, 8502, 8543, 8672, 9073, 9135
- Social Acceptance** (SEE Acceptance, Social Approval)
- Social Adjustment** (SEE Adjustment/Personal & Social)
- Social Approval** (see also Acceptance)
7308, 7882, 8034, 8075, 8083, 8108, 8112, 8116, 8382, 8679, 8895
- Social Attraction** (SEE Interpersonal Attraction)
- Social Behavior/Animal**
7607, 7713, 7731, 7736, 7741, 7749, 7817, 7818, 7819, 7820, 7821
- Social Behavior/Human** (see also Childhood/Social Behavior in)
7736, 7822, 7846, 7856, 8004, 8006, 8090, 8098, 8100, 8102, 8157, 8223, 8227, 8679, 8808, 8811, 8970
- Social Casework**
8007, 8057, 8278, 8686, 8695
- Social Change**
7202, 7986, 8006, 8011, 8058, 8059, 8061, 8062, 8063, 8064, 8065, 8066, 8067, 8068, 8069, 8136, 8210, 8471, 8476, 8681, 9119
- Social Class** (SEE Social Structure, Socioeconomic Status)
- Social Deprivation** (SEE Childhood/Disadvantaged, Socioeconomic Status)
- Social Desirability** (SEE Acceptance, Social Approval)
- Social Distance** (SEE Isolation, Social Approval)
- Social Influence** (see also Interpersonal Influence)
7342, 8127, 8130, 8134, 8135, 8136, 8476
- Social Interaction**
8013, 8055, 8121, 8126, 8361, 8374, 9033
- Social Isolation** (SEE Alienation, Isolation)
- Social Mobility** (see also Social Structure)
8010, 8017, 8056, 8068
- Social Model** (SEE Social Processes, Social Structure)
- Social Movements**
7961, 7975, 8008, 8053, 8060, 8061, 8065, 8066
- Social Perception**
7196, 7444, 7859, 7879, 7999, 8011, 8032, 8038, 8049, 8089, 8099, 8118, 8119, 8142, 8143, 8144, 8145, 8147, 8148, 8149, 8150, 8151, 8152, 8153, 8154, 8155, 8156, 8157, 8180, 8188, 8222, 8255, 8461, 8521, 8560, 8696, 8891, 8907, 8956, 8959, 8961, 9095, 9120
- Social Power** (SEE Social Influence, Interpersonal Influence, Social Movements)
- Social Psychiatry** (SEE Psychiatry, Social Processes)
- Social Psychology**
7212, 7985, 7989, 7992, 7994, 8159
- Social Reinforcement** (SEE Reinforcement/Social)
- Social Role** (SEE Role)
- Social Science**
7187, 7248, 7988, 8027
- Social Structure** (see also Socioeconomic Status)
8007, 8015, 8016, 8049, 8052, 8068, 8108, 8114, 8503, 8866, 8900, 9120
- Social Welfare** (SEE Social Casework)
- Socialization**
7736, 7850, 7868, 7871, 7880, 7958, 8555, 8978
- Society** (SEE Culture)
- Socioeconomic Status** (see also Social Structure)
7234, 7841, 7878, 7890, 7897, 7901, 7923, 7930, 7952, 7953, 7963, 7979, 7998, 8008, 8009, 8012, 8013, 8014, 8016, 8017, 8018, 8039, 8056, 8059, 8060, 8073, 8075, 8084, 8136, 8138, 8212, 8276, 8380, 8429, 8503, 8531, 8567, 8573, 8586, 8676, 8701, 8820, 8851, 8860, 8904, 8956, 8979, 9006, 9093
- Sociology**
7188, 7193, 7985, 7994
- Sociometric Status** (SEE Social Approval)
- Sociometry** (SEE Social Approval)
- Sociopathy** (SEE Behavior Problems, Crime & Criminals, Antisocial Behavior)
- Sodium Chloride** (SEE Food, Biochemistry)
- Soldier** (SEE Personnel/Military)
- Somesthesia** (see also Kinesthesia, Cutaneous Sense)
7707, 7875, 8732, 9066, 9077
- Sorting** (SEE Categorical Behavior)
- Sound** (see also Audition, Noise)
7312, 7313, 7315, 7316, 7317, 7474, 7563, 7565, 7597, 7598, 7928, 8171, 8332, 8623, 9122
- Space Flight** (SEE Aviation, Environment, Simulation)
- Space Orientation** (SEE Orientation)
- Space Perception** (SEE Perception/Space)
- Special Education** (SEE Education/Special)
- Speech** (see also next headings, Verbal Behavior)
7597, 7905, 7915, 7971, 8125, 8166, 8332, 8583, 8618, 8644, 8804, 9003
- Speech Perception**
7319, 7984, 8718
- Speech Therapy**
8725, 8729, 8807, 8934
- Speech/Defective** (see also Speech Therapy, Stuttering)
8284, 8723, 8724, 8725, 8726, 8728, 8729, 8734, 8737, 8742, 8745
- Speed** (SEE Movement)
- Spiral Aftereffect** (SEE Aftereffect)
- Sports** (SEE Recreation, Education/Physical)
- Stammering** (SEE Stuttering)
- Stanford-Binet Intelligence Scale** (SEE Test/Intelligence)
- Startle** (SEE Response)

BRIEF SUBJECT INDEX

Statistics (see also Mathematics, Factor Analysis)
7211, 7216, 7217, 7218, 7219, 7220, 7221, 7222, 7223, 7224, 7233, 7241, 7261, 7263, 7993, 8270, 8881, 9019, 9108

Status (SEE Social Structure, Socioeconomic Status)

Stereotype (see also Attitude)
7212, 8014, 8039, 8085, 8088, 8119, 8143, 8155

Stimulant (SEE Drugs)

Stimulation
7266, 7345, 7363, 7424, 7445, 7553, 7561, 7609, 7698, 7721, 7728, 7744, 8726, 8739, 8816

Stimulation/Central (SEE Brain Stimulation, Rat/Brain Stimulation in)

Stimulus
7278, 7283, 7290, 7307, 7350, 7353, 7356, 7376, 7392, 7422, 7423, 7440, 7747, 7762, 7771, 7779, 7786, 7787, 7796, 7806, 7863, 7876, 7899

Stimulus Generalization (SEE Generalization)

Stimulus Intensity (see also Shock & Shock Intensity)
7256, 7280, 7309, 7316, 7317, 7363, 7380, 7798, 7826, 7827

Strategy
7282, 7313, 7362, 7394, 7432, 7759, 7894, 7901

Stress (see also Conflict, Stress/Physiological, Rat/Stress Effects in)
7410, 7567, 7711, 7852, 8267, 8417, 8458, 8581, 8722, 8849, 9028, 9065, 9071, 9078, 9084, 9123, 9137

Stress/Physiological
8735, 9078

Stroke (SEE Brain Disorder, Cardiovascular Disorders)

Strong Vocational Interest Blank (SEE Occupational Interest)

Student (see also next headings, School Dropout)
7245, 7359, 8037, 8920, 8949, 8988

Student Attitude (SEE Attitude/Student)

Student Dropout (SEE School Dropout)

Student Protest (SEE Social Movements, Attitude/Student)

Student Teacher (SEE Teacher Training)

Student/Collge (see also Achievement/Academic-Collge)
7246, 7456, 7640, 8099, 8103, 8117, 8127, 8140, 8147, 8192, 8201, 8248, 8250, 8325, 8655, 8875, 8877, 8887, 8895, 8896, 8898, 8902, 8904, 8910, 8955, 8959, 8960, 8962, 8987, 8994, 9006, 9036

Student/Collge-Attitude
8088, 8875, 8890, 8893, 8897, 8906, 8918, 8985, 8990, 9012, 9025

Student/Collge-Personality
8194, 8510, 8883, 8903, 8906, 8918, 8990, 8997, 9028

Student/Elementary School (see also Childhood & Children, Achievement/Academic-Elementary School)
7860, 7901, 7928, 7934, 7953, 8891, 8908, 8919, 8921, 8953, 8970, 8974, 8977, 8979, 8980, 8982, 8983, 8986, 8991, 9005, 9008, 9022, 9027

Student/Gifted (SEE Gifted)

Student/Graduate
8275, 8894, 8897

Student/High School (see also Adolescence)
7370, 7431, 7435, 7829, 8036, 8134, 8203, 8237, 8896, 8899, 8900, 8901, 8909, 8922, 8957, 9002, 9024, 9033, 9046, 9117

Student/Junior High School (see also Adolescence)
7883, 8123, 8230, 8907, 8932, 8956, 8968, 8974, 8993, 9002, 9009

Stuttering (see also Speech/Defective)
8721, 8722, 8727, 8838

Subception (SEE Perception, Visual Perception)

Subliminal Perception (SEE Perception, Visual Perception, Threshold)

Submission (SEE Dominance, Interpersonal

Influence

Suburbs (SEE Urban & Suburban Environment)

Success (SEE Achievement)

Sucking (SEE Instinctive Behavior)

Suggestibility (SEE Hypnosis, Personality Trait)

Suicide (see also Death)
8082, 8182, 8463, 8530, 8531, 8532, 8533, 8534, 8535, 8536, 8572

Superego (SEE Psychoanalytic Theory)

Supervision (SEE Leadership, Management)

Surgery (see also Medicine)
7158, 8322, 8323, 8449, 8747, 8754, 8756, 8758, 8777, 8783, 8790, 8844, 8852

Survey (see also Inventory, Questionnaire, Scale, Testing Methods)
8084, 8191, 8809, 8818, 8989, 9021, 9068, 9113

SVIB (SEE Occupational Interest)

Symbol & Symbolism (SEE Meaning, Communication, Language)

Sympathetic Nervous System (SEE Nervous System/Autonomic)

Symposium
7480, 8057, 8261, 8611, 8616, 9039

Symptom (see also Diagnosis, Psychodiagnosis)
8293, 8392, 8479, 8489, 8493, 8505, 8507, 8583, 8587, 8605, 8667, 8715, 8743, 8749, 8761, 8846, 8855

Syntax (see also Grammar)
8164, 8169, 8175, 8583, 8757, 8983

Systems Analysis (SEE Organizational Structure)

Tachistoscope (SEE Apparatus)

Tactile (SEE Cutaneous Sense)

Talent (SEE Ability)

Target (SEE Engineering Psychology, Military)

Task
7296, 7343, 7427, 8217

Taste (see also Food)
7828, 8662, 9125

Teacher
8674, 8891, 8895, 8925, 8930, 8959, 8963, 8970, 8978, 9022, 9027, 9036

Teacher Attitudes & Personality
8891, 8965, 8968, 8972

Teacher Training
7969, 8876, 8964, 8966, 8967, 8969, 8971, 8972, 9036

Teaching (see also next headings)
8105, 9000, 9009

Teaching Aids (see also Programed Instruction)
8303, 8876, 8935, 8969, 9013, 9020, 9023, 9027, 9028, 9029, 9030, 9031, 9034

Teaching Method (see also Programed Instruction)
7372, 7883, 8876, 8927, 8931, 8932, 8934, 8969, 8984, 8998, 9002, 9004, 9007, 9008, 9010, 9011, 9012, 9014, 9015, 9017, 9018, 9022, 9024, 9025, 9026, 9032, 9033, 9035, 9036, 9061

Teaching/Television (SEE Television)

Team Teaching (SEE Teaching Method)

Telepathy (SEE Parapsychology)

Television
7976, 8133, 8876, 9014

Television/Educational (SEE Television)

Temperature
7467, 7476, 7479, 7501, 7621, 7706, 7707, 7749, 7754

Temperature Sense (SEE Cutaneous Sense)

Tension (SEE Conflict, Stress, Anxiety)

Territorial Behavior (SEE Instinctive Behavior)

Test & Testing (see also next headings, Projective Technique, specific tests)
7203, 7204, 7218, 7228, 7231, 7232, 7233, 7234, 7235, 7237, 7238, 7241, 7242, 7243, 7244, 7860, 8207, 8228, 8488, 8491, 8741, 8775, 8804, 8814, 8853, 8922, 8945, 8951, 8952, 8994, 9047, 9048, 9111

Test Anxiety
7239, 7342, 7640, 8919

Test/Ability (SEE Test/Aptitude)

Test/Achievement
7236, 7239, 8765, 8909, 8911, 8912, 8914, 8915, 8916, 8920, 8994, 9011

Test/Aptitude
7236, 8231, 8920, 8993, 8994, 9051, 9054, 9056, 9057

Test/Intelligence
7916, 7919, 7920, 7922, 7982, 7997, 8230, 8233, 8234, 8235, 8349, 8712, 8765, 8921

Test/Personality
8147, 8203, 8207, 8242, 8243, 8244, 8245, 8246, 8248, 8249, 8250, 8252, 8498, 8506, 8508, 8555, 8561, 8678, 8714, 8918, 8920, 8972, 8982

Testing Methods
7237, 7240, 7943, 8230, 8231, 8259, 8913, 8915, 8916

Thalidomide
7505, 7529, 7536, 7546, 7553, 7558, 7568, 8790

Thematic Apperception Test (SEE Projective Technique)

Theory (see also Learning Theory, Personality Theory, Psychoanalytic Theory, Information Theory, Motivation Theory, Reinforcement Theory)
7161, 7162, 7178, 7179, 7191, 7192, 7210, 7213, 7263, 7270, 7273, 7285, 7286, 7301, 7321, 7370, 7374, 7436, 7455, 7470, 7604, 7769, 7851, 7988, 7989, 8001, 8034, 8068, 8092, 8115, 8157, 8163, 8179, 8198, 8220, 8229, 8235, 8267, 8290, 8390, 8472, 8492, 8533, 8574, 8641, 8699, 8865, 8949, 9126

Therapeutic Community (SEE Community, Psychotherapy/Methods in)

Therapeutic Process (see also Empathy)
8115, 8132, 8313, 8336, 8341, 8344, 8348, 8354, 8355, 8356, 8357, 8358, 8359, 8360, 8361, 8362, 8363, 8364, 8365, 8366, 8367, 8389, 8396, 8459, 8608, 8620

Therapist
8296, 8313, 8319, 8343, 8344, 8358, 8359, 8360, 8362, 8367

Therapy (see also Behavior Therapy, Drug Therapy, Family Therapy, Psychiatry, Psychoanalysis, Psychotherapy, Speech Therapy, Treatment, Schizophrenia/Treatment of, Mental Retardation/Treatment of, Case Report-Treatment, Electroconvulsive Shock Therapy, Treatment/Outpatient, Psychiatric Patient Treatment, Occupational & Physical Therapy)
8132, 8448, 8529, 8811

Thinking (see also Cognition, Logic, Categorical Behavior)
7214, 7325, 7392, 7421, 7423, 7424, 7425, 7426, 7427, 7430, 7864, 7875, 7892, 7911, 8165, 8238, 8565, 9016

Thirst (SEE Water & Water Intake, Deprivation, Motivation)

Threat
8540, 8696, 9065, 9081

Threshold
7263, 7278, 7280, 7290, 7320, 7322, 7323, 7345, 7498, 7533, 7597, 7602, 7710, 7826, 7827, 8803

Time (see also Perception/Time, Reaction Time)
7274, 7401, 7744, 8073, 8238, 8251, 8536, 8575, 8576

Time Estimation
7275, 7276

Time Interval Effects (SEE Interval/Time, Interval/Interstimulus)

Token (SEE Reinforcement)

Tone (SEE Sound)

Touch (SEE Cutaneous Sense)

Tracking (SEE Visual Perception)

Training (see also Teacher Training)
7547, 7929, 7942, 8062, 8102, 8105, 8124, 8962, 8979, 9060, 9061, 9062, 9063

Training/Industrial & Military
8892, 9050, 9051, 9056, 9057, 9058, 9059, 9064, 9080, 9081, 9083, 9087

Training/Psychology

7195, 8031, 8263, 8275, 8295, 8296, 8301, 8302, 8303, 8393, 8530, 8655, 8690, 8954

Training/Teacher (SEE Teacher Training)**Trait** (SEE Personality Trait)**Tranquilizer** (see also Drug Therapy, Chlorpromazine)

7635, 7636, 7637, 7640, 7652, 7656, 7657, 7666, 7674, 7680, 7688, 7689, 7691, 8413, 8417, 8420, 8421, 8425, 8428, 8429, 8433, 8440, 8653, 8657, 8658, 8784, 8787, 8794, 8854, 8869

Transfer (see also Generalization, Learning Transfer)

7432, 7608, 7611, 8135

Transference (SEE Therapeutic Process, Interpersonal Processes)**Transsexualism** (SEE Sexual Deviation)**Transvestism** (SEE Sexual Deviation)**Trauma** (SEE Stress, Emotion)**Treatment** (see also Therapy, Schizophrenia/ Treatment of, Case Report-Treatment, Mental Retardation/Treatment of)

8366, 8428, 8429, 8452, 8526, 8598, 8600, 8838, 8849, 8871

Treatment/Outpatient

8297, 8351, 8378, 8399, 8421, 8677, 8839

Trust (SEE Interpersonal Processes, Social Perception)**Tuberculosis** (SEE Disease)**Twins** (see also Genetics, Family Relations)

7242, 8629, 8664

Ulcer (SEE Illness)**Unconscious** (SEE Motivation, Conscious States, Psychoanalytic Theory)**Underachievement** (SEE Achievement/Over & Under)**Underdeveloped Countries** (SEE Cultures & Countries)**Undergraduates** (SEE Student/College)**Underprivileged** (SEE Socioeconomic Status, Childhood/Disadvantaged)**Underwater Environment** (SEE Environment)**Unemployment** (SEE Personnel/Industrial, Socioeconomic Status)**Union** (SEE Personnel/Industrial)**United States**

NOW AVAILABLE

A SOURCE BOOK FOR THE FIRST COURSE IN PSYCHOLOGY

A source book for teachers of general psychology, containing reviews of introductory texts, books of readings, and lab manuals; descriptions of psychological journals; a catalogue of audiovisual materials; a listing of psychological equipment manufacturers; bibliographies of collateral readings for students and reference works for teachers; names and addresses of national organizations; a discussion of teaching methods; and suggestions of ways to organize a first course in psychology. The book is one of several products of a project held at Oberlin College in the summer of 1970. Although the title of the book — *PROGRAM ON THE TEACHING OF PSYCHOLOGY IN THE SECONDARY SCHOOL: Final Report* indicates an applicability to a particular academic level, the book is useful in teaching general psychology regardless of the level.

Pages: 128

Price: \$2.00

A READER'S GUIDE TO USING PSYCHOLOGICAL ABSTRACTS

Psychological Abstracts (PA) attempts to cover the world's literature in psychology and related topics. PA publishes abstracts of published primary documents such as technical reports, journals, and monographs. Books and separates are covered by bibliographic citation with an additional annotation if the title is not definitive.

PA is published in two volumes per year (effective January 1971), six issues per volume. A cumulative index is published for each six-month volume.

A monthly issue contains: Table of Contents (classification scheme); abstracts; list of abbreviations used in the abstracts; Author Index; and Brief Subject Index. The Brief Subject Index consists of index heading terms and abstract numbers.

A cumulative index issue contains: Table of Contents for the six-month volume; complete list of all journals regularly searched by PA; list of volunteer abstractors; list of abbreviations used in the abstracts; the cumulative author index for the six-month volume; list of subject index heading terms; and cumulative subject index for the six-month volume, which consists of index heading terms, descriptive phrases for each abstract, four-letter abbreviations indicating languages other than English and abstract numbers.

Within the monthly issue, abstracts are arranged in alphabetical order by author, categorized under the content headings as listed in the Table of Contents. The abstracts are numbered consecutively within a six-month volume.

PA's author index is intended to be a name index only and not a person index. Alphabetical rules are strictly applied, consequently, "J. Smith" and "John Smith" would appear in the index as two separate entries even though they may in fact be the same person. By the same token two entries of "J. Smith" would appear as J. Smith with two abstract numbers following it, even though they may be two different people.

The subject index heading terms are reviewed annually and revised as necessary as subjects of interest to the discipline shift and increase. For example, the term "Drug Usage and Abuse" was added to the list of terms when the increase of articles on the topic and interest in the discipline appeared to demand it. Previous to the addition of this term these articles were placed under terms such as "Drugs," "Drug Effects," "Drug Therapy," and "Drug Addiction." Conversely, as a topic decreases in popularity, it may become necessary to delete a term or combine several terms into one general term.

PA is computer-printed and because of necessary production procedures there is a possibility that on occasion the abstracts representing articles from a single issue of a primary journal may appear in several issues of PA, e.g., an issue of the *Journal of Psychology* may include 20 relevant articles; abstracts for 17 of these articles may appear in the May issue of PA, the other 3, in the June issue.

The following are examples of entries and explanations of their elements.

JOURNAL ARTICLE ENTRY

(1a) Brown, Mildred; (1b) Jones, John J., (1c) Wilson, J. T., & (1d) Carson, E. Norman. (2) (*Boston U.*) (3) Single cell activity in the hypothalamus in intact and adrenalectomized rats. (4) *Psychological Journal*, (5a) 1970(Jan), (5b) Vol. 13(6), (5c) 173-190.—(6) In this replication of a study by A. R. Arnold (7) (see (7a) PA, (7b) Vol. 42: (7c) 1791 and 45: (7d) Issue 1), 123 intact and adrenalectomized male Wistar rats were tested under urethane anesthesia. Adrenalectomy increased the mean spontaneous discharge and changed the pattern of firing of anterior hypothalamic neurons. The possible relation of these electrophysiological findings to the effects of adrenalectomy on the CNS is discussed. (8) (German & French summaries) (9) (97 ref.).—(10) *Journal abstract.*

1a-1d—Authors: Only four are listed; if there are more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address: A mailable address is included for the first-named author only.

3—Title: Article title including subtitles. If the original article is in a foreign language, that title is given, followed by the English translation in brackets, e.g., [Parapsychology].

4—Primary journal title in full.

5a—Year and month of the primary publication issue.

5b—Volume number followed by issue number in parentheses.

5c—Inclusive pagination of the article.

6—Text of the abstract.

7—Reference to a previous entry in *Psychological Abstracts*.

7a—PA=Psychological Abstracts.

7b—PA volume number.

7c—PA abstract number.

7d—PA issue number where abstract number is unavailable at time of publication. When only the issue number is given, one must consult the Author Index of the PA issue noted in order to determine the abstract number for the author and article cited.

8—Summaries included in the primary source are listed when in language(s) other than that of the article.

9—Number of references is included when 15 or more. May also appear as pages, e.g., (3 p. ref.).

10—Abstract source.

BOOK ENTRY

(1) Jones, John J. (2) (Ed.) (3) (*U. Chicago, Medical School*) (4) *Sleep and dreams*. (5) New York, N.Y.: (6) Appleton-Century-Crofts, (6a) 1970. (6b) ix, (6c) 396 p. (6d) \$6.50(cloth), (6e) \$2.50(paper).

1—Name of author(s) or editor(s). If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Designation of editor.

3—Address of first-named author/editor only.

4—Book title.

5—Place of publication.

6—Publisher's name.

6a—Year of publication.

6b—Prepagination.

6c—Total pagination.

6d—Hardcover price.

6e—Paperback price.

BOOK CHAPTER ENTRY

(1) Wilson, J. T. (2) (*U. California, Santa Cruz*) (3) *The stages of sleep*. (4) In (4a) J. J. Jones (4b) (Ed.), (4c) "Sleep and dreams." (5) (See (5a) PA, (5b) Vol. 45: (5c) Issue 1) (6) 17-47.

1—Author(s) of chapter cited. If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address of first-named author only.

3—Chapter title.

4—Reference to entry in PA which includes bibliographic information for the whole book. When only the issue number is given (see 5c), one must consult the Author Index of the PA issue noted in order to determine the abstract number for the Editor of the book.

4a—Editor's name.

4b—Editor designation.

4c—Book title.

5—Referral information.

6—Inclusive pagination for cited chapter.

ABBREVIATIONS

Abbreviations appearing in this issue include along with units of measurement (e.g., m. = inch, wk. = week, hr. = hour, etc.):

AA = Alcoholics Anonymous
AC = alternating current
ACTH = adrenocorticotrophic hormone
AM = ante meridiem
amp. = ampere

bpm = beats per minute

C = centigrade
¢ = cents
CA = chronological age
cc = cubic centimeter
CER = conditioned emotional response
CFF = critical flicker frequency
CNS = central nervous system
cps = cycles per second
CR = conditioned response (or reflex)
CRF = continuous reinforcement
CRT = cathode ray tube
CS = conditioned stimulus
CVC = consonant-vowel-consonant

db. = decibel
DC = direct current
DL = differential limen
DNA = deoxyribonucleic acid
DRL = differential reinforcement of low rates

E = experimenter
ECS = electroconvulsive shock
EEG = electroencephalogram (or -graphy)
EKG = electrocardiogram
EMG = electromyogram
ESP = extrasensory perception
Exp. = experiment

F = Fahrenheit
ft-c = foot-candle
ft-L = foot-lambert

g = gravity
gm. = gram(s)
GPA = grade-point average
GSR = galvanic skin response

Hz. = Hertz

ICS = intracranial stimulation
im = intramuscularly
ip = intraperitoneally
IQ(s) = intelligence quotient(s)
ITI = intertrial interval
iv = intravenously

kc. = kilocycle
kg. = kilogram
kg/m = kilogram per meter
kHz. = kilo-Hertz

LD = lethal dose
LSD = lysergic acid diethylamide

m. = meter
M = mean
M = mole or molar
ma. = milliamperes
MA = mental age
MAO = monoaminoxidase
mL. = milliliter
mm. = millimeter
mph = miles per hour
msec. = millisecond(s)

N = number
NREM = nonrapid eye movement

O = observer

p = probability
% = percent

PM = post meridiem
pps = pulses per second
PRE = partial reinforcement effect
PSE = point of subjective equality
psi = pounds per sq. in.

r = product-moment correlation
r = roentgen
REM = rapid eye movement
rms = root mean square
RNA = ribonucleic acid
rpm = revolutions per minute
RT = reaction time

S = subject
SEU = subjectively expected utility
SPL = sound pressure level

TV = television

UCR = unconditioned response
UCS = unconditioned stimulus
UHF = ultrahigh frequency

V = volt
VHF = very high frequency
vs. = versus

YMCA = Young Men's Christian Association
YWCA = Young Women's Christian Association

Test abbreviations include:

California E Scale (Ethnocentrism)
California F Scale (Fascism)
CMA scale = Children's Manifest Anxiety scale
CPI = California Psychological Inventory
CTMM = California Test of Mental Maturity
EPPS = Edwards Personal Preference Schedule
MA scale = (Taylor) Manifest Anxiety scale
MMPI = Minnesota Multiphasic Personality Inventory
MPI = Maudsley Personality Inventory
16 PF = Cattell's 16 Personality Factor Questionnaire
SVIB = Strong Vocational Interest Blank
TAT = Thematic Apperception Test
WAIS = Wechsler Adult Intelligence Scale
WISC = Wechsler Intelligence Scale for Children

Abbreviations used in authors' addresses are:

Assn. = association
Assoc. = associates
Co. = company
Coll. = college
Corp. = corporation
Dept. = department
Div. = division
Inst. = institute
Hosp. = hospital
Lab. = laboratory
Inc. = incorporated
U. = university

Ave. = avenue
Bldg. = building
Blvd. = boulevard
Ct. = court
Dr. = drive
Ft. = fort
Mt. = mount
Pkwy. = parkway
Pl. = place
PO = post office
Rd. = road
St. = street
N, S, E, W = North, South, East, West
U.S. = United States
USSR = Union of Soviet Socialist Republic

Psychological Abstracts

VOLUME 45

JUNE 1971

NUMBER 6

GENERAL

OBITUARIES

9138. Neubauer, Peter B. Herman Nunberg 1884-1970. *Psychoanalytic Quarterly*, 1970(Oct), Vol. 39(4), 622-624.—Obituary.—J. Z. Elias.

HISTORY

9139. Rosenzweig, Saul. (Washington U.) *William James et le courant de conscience*. [William James and the stream of consciousness.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(17-19), 1001-1009.—The similarity of Freud's analytic method of free association and William James' stream of consciousness is attributed to the influence upon both men of such individuals as Charcot, Salomon Stricker, and J. J. G. Wilkinson. Wilkinson, who was a close friend of the father of William and Henry published a collection of impromptu poetry in 1857 which he described as having been written following a "new method of impression" and is credited with the first application of free association to literature. The stream of consciousness in literature found its complete development in the writings of Gertrude Stein, James Joyce, and Marcel Proust through the influence of Henry James. (44 ref.)—R. E. Smith.

PHILOSOPHY

9140. Cornett, Linda B. (Emory U.) *The undermining effects of Kant's psychological theory upon his ethics*. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-A), 2435.

9141. Gaete, Sergio. (U. Chile, Psychiatric Clinic, Santiago) *La conciencia como significación*. [Consciousness as signification.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Oct), Vol. 28(4), 306-330.—Discusses the nature of consciousness and its relation to reality. Natural reality is regarded as the substance and object of consciousness; consciousness is considered to be the union of action and intentional objective, resulting in a constant variety of causes and motives. It is this union which forms the signification of consciousness. The joining the act and object in consciousness is opposed to states of unconsciousness, extraconsciousness, and subconsciousness. Consciousness is thought to be of a sensible type, encompassing rational and objective as well as affective and subjective dimensions. This is contrasted with intellectual consciousness where abstract reasoning processes are utilized. Hypotheses considering (a) gestalt as a unity factor in intellectual consciousness, and (b) structure of meaning (Sinnzusammenhang) as the unity factor in sensible consciousness are proposed. (English summary) (60 ref.)—P. Hertzberg.

9142. Verges, Frank. (U. California, San Diego) *The*

argument from perceptual illusion. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-A), 2447.

PARAPSYCHOLOGY

9143. Chiarabba, G. B. *Un caso di fenomeno di preconsocenza*. [A case of foreknowledge phenomena.] *Rassegna Italiana di Ricerca Psicica*, 1969, No. 1-3, 71-80.—The author who is an expert in ESP and has developed in himself a predisposition for foreknowledge, which began in 1923, describes his own documented case of foreknowledge. The case involves an ordinary perception of his wife's unexpected return from a visit, where she beckons him into the dining room, where the windows are ajar, and shows him a shining, silver-like object. He reports the perception to his 2 children. Some months later the incident occurs in reality. This type of perception and dreams are compared. In dreams there is intense cogitative activity which, generally, assumes a fantastic character. In foreknowledge phenomena, the conscious is totally concentrated on the attentive function. The sensorial medium is absent and is substituted by the psyche. The perception cannot be realized without the concurrence of attention; in contrast I can eat without tasting if the attention is absorbed in a dominant thought. The attention of the S must be absorbed toward the object, and this determines the isolation of the psyche.—A. M. Farfaglia.

9144. Fieandt, Kai V. (Helsingfors U., Finland) *Om vissa felkällor inom parapsykologin*. [Sources of errors in parapsychology.] *Nordisk Psykologi*, 1969, Vol. 21(4), 277-282.—About 15 yr. ago, the Finnish Broadcasting Corporation sponsored a program of experimental telepathy, which proved to be very popular. A similar program, but with a more scientific approach, was sent over a Finnish TV station in 1960, the results of which were later published in a doctoral thesis. The plans sent out to listeners had 12 horizontal lines, each containing 4 alternative symbols, words, or letters. 30 persons, assembled in the studio, concentrated on 1 of these, aided by pertinent illustrations. 1 row of words read: pine needle, spruce cone, birch leaf, and apple. Apple was correct and was underlined on a majority of reply sheets. The analysts concluded that this was due more to the attractive value of the fruits, than to ESP. Similarly, among the 4 symbols used in the Rhine tests (circle, triangle, square, and cross) the cross was the most "attractive." It is concluded that the attractive value of a word or symbol must be considered in evaluating errors in ESP. (English summary)—P. von Toal.

9145. Medhurst, R. G. *Note on the "ESP" cards designed in the parapsychology laboratory, Duke University*. *Journal of the Society for Psychical Research*, 1969(Jun), Vol. 45(740), 81-85.—Reports that many of the decks of ESP cards are not suitable for experimental work, because the symbol on the front is discernible from the back.—S. Knapp.

9146. Nestler, Vincenzo. *Ricerche moderne sulla*

"Psicomètria". [Modern studies on "psychometry."]
Rassegna Italiana di Ricerca Psychica, 1969, No. 1-3, 63-70.—Defines psychometry as the phenomena where the sensitive (medium) by touching (or just looking at) an object, receives and manifests impressions of events or real beings that have some connection with the object: the occult sensitivity stimulated by objects. Previous studies in psychometry are listed from Buchanan (1849) and Denton (1863); they were the 1st to use the term, and from their experiments concluded that events could be relived by a sensitive from the mere contact with an object. Modern innovations in psychometry are found in (a) the Pratt Berge method which evaluates the objectivity, independence, and particularity of the sensitive's affirmation; (b) the use of hypnosis which can eliminate psychic impediments and allows the sensitive to become "seeing"; and (c) new hypotheses, e.g., the psycho-energetic hypothesis where the medium becomes the center of the outside and inside phenomena, bringing together the atmosphere and the people concerned. It is suggested that psychometry could be an instrument toward a better understanding of the human spirit and of its nature.—A. M. Farfaglia.

THEORY & SYSTEMS

9147. **Guillain, A.** *Le concept de crise en médecine hippocratique et en psychologie du développement.* [The concept of crisis in Hippocratic medicine and in developmental psychology.] *Journal de Psychologie Normale et Pathologique*, 1970(Jul), No. 3, 295-311.—The concept of crisis is common to certain medical and psychological theories. The Hippocratic crisis involves rupture, discontinuity, etc., and refers to rules which articulate other aspects: a critical day, paroxysm, metastasis, acme, etc. It is structurally temporal, a phenomenon of the strategic structure of intervention (Kairos' theory); it refers to a conception of equilibrium borrowed from politics (isonomie). The psychology of development takes up Debesse's concept of crisis of juvenile originality and attempts to elaborate further. In this case one finds a clear theoretical opposition: (a) a stable equilibrium of which the crisis is a passing disturbance, e.g., Piaget's endogenous theory of factors of development, conceptualized time; and (b) an oscillating system in which the crisis is an extreme position, e.g., Wailon's exogenous theory of developmental function, historical time. This opposition poses the problem of a schematization, a conceptualization of historic time which permits one to rationally establish therapeutic intervention.—L. A. Ostlund.

9148. **Macdonald, Robert E.** (Michigan State U.) *The psychology of Abraham Maslow in educational perspective: Selected criticisms and applications.* *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-A), 933.

9149. **Rhodes, Sheila S.** (State U. New York, Buffalo) *A critique of the ethical utility of interpersonal psychology.* *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-A), 1845.

9150. **Suter, Ronald.** (Michigan State U.) *On being angry: Paul Ziff on behaviorism.* *Michigan Academician*, 1970(Sum), Vol. 3(1), 19-23.—In a previous article P. Ziff attempted to refute what he called 2 bad arguments against behaviorism. He actually presented 3 fallacious arguments, but 2 of his own 3 arguments were fallacious. Ziff is corrected on how to properly refute the

arguments against behaviorism. It is concluded, however, that the behaviorism which Ziff is defending is actually empty. While Ziff claims an organism is angry if and only if it is behaving in anger, he is never able to specify what kind of behavior is anger behavior. In order to make behaviorism true the behaviorist would have to appeal explicitly to the very notion he is trying to clarify. He would have to say: "Angry ways of behaving are the ways in which people behave when they are angry."—S. R. Diamond.

EDUCATION & TRAINING

PROFESSIONAL DEVELOPMENTS

9151. ———. *Proceedings of the Seventy-Eighth Annual Meeting of the American Psychological Association, September 3-8, 1970, Miami Beach, Florida.* *American Psychologist*, 1970(Dec), Vol. 25(12), 1113-1169.—Presents the program of the convention including presented papers, symposia, discussions, workshops, and films.

9152. ———. *The International Reference Center for Information on Psychotropic Drugs: News, activities, and contributions by participants of the Centers' network.* *Psychopharmacology Bulletin*, 1969(Jul), Vol. 5(3), 1-3.—Presents information on (a) the development of an indexing system and drug categorization by the International Reference Center at the National Institutes of Mental Health; and (b) a 49-item bibliography of papers on psychotropic drugs, published in Swiss medical journals in 1968.—G. Steele.

9153. **Droz, Rémy.** (U. Geneva, Psychological Lab., Switzerland) *Tentatives d'application de la psychologie et de l'épistémologie génétiques.* [Conditions for the application of psychology and genetic epistemology.] *Schweizerische Zeitschrift für Psychologie und ihre Anwendungen*, 1970, Vol. 29(3), 417-422.—Briefly enumerates and describes a number of tentative applications of Piaget's genetic psychology and epistemology in the fields of applied psychology (clinical, counseling) and education. (German summary)—*English summary.*

9154. **Gurman, Alan S.** (Teachers Coll., Columbia U.) *Institutional sources of articles in the "Journal of Consulting and Clinical Psychology": 1951-1968.* *Journal of Consulting and Clinical Psychology*, 1971(Feb), Vol. 36(1), 133-135.—Reviewed the institutional affiliations of authors who have published articles in the *Journal of Consulting and Clinical Psychology* from 1951-1968. The Veterans Administration emerged as the leading institutional producer of articles in this period. Results suggest that the major university force in publication is found in the midwest, although no 1 institution or related set of institutions dominated the clinical research. Implications about the role and nature of midwestern clinical programs and American Psychological Association-approved programs in general in this pattern are discussed.—*Journal abstract.*

9155. **Little, Kenneth B.** (American Psychological Assn., Washington, D.C.) *Report of the Executive Officer: 1970.* *American Psychologist*, 1971(Jan), Vol. 26(1), 1-11.

9156. **Vinitzky, Michael H.** (U. Minnesota) *Changes in the interests of psychologists with age and*

critical incidents in their careers. *Dissertation Abstracts International*, 1970(Sep), Vol. 31(3-A), 1028-1029.
